

# AM335x ARM® Cortex™-A8 Microprocessors (MPUs)

## Technical Reference Manual

Literature Number: SPRUH73H  
October 2011–Revised April 2013

<b>Preface</b> .....	<b>149</b>
<b>1 Introduction</b> .....	<b>150</b>
1.1 AM335x Family .....	150
1.1.1 Device Features .....	150
1.1.2 Device Identification .....	151
1.1.3 Feature Identification .....	151
1.2 Silicon Revision Functional Differences and Enhancements .....	153
1.2.1 Added RTC Alarm Wakeup for DeepSleep Modes .....	153
1.2.2 Changed BOOTP Identifier .....	153
1.2.3 Changed Product String in USB Descriptor .....	153
1.2.4 Added DPLL Power Switch Control and Status Registers .....	153
1.2.5 Added Control for CORE SRAM LDO Retention Mode .....	153
1.2.6 Added Pin Mux Options for GPMC_A9 to Facilitate RMIID Pin Muxing .....	153
1.2.7 Changed Polarity of Input Signal nNMI (Pin EXTINTn) .....	153
1.2.8 Changed Default Value of ncin and pcin Bits in vtp_ctrl Register .....	154
1.2.9 Changed Default Value of RGMII Mode to No Internal Delay .....	154
1.2.10 Changed Default Value of RMIID Clock Source .....	154
1.2.11 Changed the Method of Determining Speed of Operation During EMAC Boot .....	154
1.2.12 Added EFUSE_SMA Register for Help Identifying Different Device Variants .....	154
<b>2 Memory Map</b> .....	<b>155</b>
2.1 ARM Cortex-A8 Memory Map .....	155
<b>3 ARM MPU Subsystem</b> .....	<b>164</b>
3.1 ARM Cortex-A8 MPU Subsystem .....	165
3.1.1 Features .....	166
3.1.2 MPU Subsystem Integration .....	166
3.1.3 MPU Subsystem Clock and Reset Distribution .....	167
3.1.4 ARM Subchip .....	170
3.1.5 Interrupt Controller .....	171
3.1.6 Power Management .....	171
3.1.7 ARM Programming Model .....	174
<b>4 Programmable Real-Time Unit and Industrial Communication Subsystem (PRU-ICSS)</b> .....	<b>176</b>
4.1 Introduction .....	177
<b>5 Graphics Accelerator (SGX)</b> .....	<b>178</b>
5.1 Introduction .....	179
5.1.1 POWERVR SGX Main Features .....	179
5.1.2 SGX 3D Features .....	179
5.1.3 Universal Scalable Shader Engine (USSE) – Key Features .....	180
5.1.4 Unsupported Features .....	181
5.2 Integration .....	182
5.2.1 SGX530 Connectivity Attributes .....	182
5.2.2 SGX530 Clock and Reset Management .....	182
5.2.3 SGX530 Pin List .....	183
5.3 Functional Description .....	184
5.3.1 SGX Block Diagram .....	184

5.3.2	SGX Elements Description .....	184
<b>6</b>	<b>Interrupts .....</b>	<b>186</b>
6.1	Functional Description .....	187
6.1.1	Interrupt Processing .....	188
6.1.2	Register Protection .....	189
6.1.3	Module Power Saving .....	189
6.1.4	Error Handling .....	189
6.1.5	Interrupt Handling .....	189
6.2	Basic Programming Model .....	190
6.2.1	Initialization Sequence .....	190
6.2.2	INTC Processing Sequence .....	190
6.2.3	INTC Preemptive Processing Sequence .....	194
6.2.4	Interrupt Preemption .....	198
6.2.5	ARM A8 INTC Spurious Interrupt Handling .....	198
6.3	ARM Cortex-A8 Interrupts .....	199
6.4	PWM Events .....	203
6.5	Interrupt Controller Registers .....	204
6.5.1	INTC Registers .....	204
<b>7</b>	<b>Memory Subsystem .....</b>	<b>250</b>
7.1	GPMC .....	251
7.1.1	Introduction .....	251
7.1.2	Integration .....	254
7.1.3	Functional Description .....	256
7.1.4	Use Cases .....	355
7.1.5	Registers .....	366
7.2	OCMC-RAM .....	398
7.2.1	Introduction .....	398
7.2.2	Integration .....	399
7.3	EMIF .....	400
7.3.1	Introduction .....	400
7.3.2	Integration .....	402
7.3.3	Functional Description .....	404
7.3.4	Use Cases .....	422
7.3.5	EMIF4D Registers .....	422
7.3.6	DDR2/3/mDDR PHY Registers .....	467
7.4	ELM .....	476
7.4.1	Introduction .....	476
7.4.2	Integration .....	477
7.4.3	Functional Description .....	478
7.4.4	Basic Programming Model .....	481
7.4.5	ELM Registers .....	487
<b>8</b>	<b>Power, Reset, and Clock Management (PRCM) .....</b>	<b>499</b>
8.1	Power, Reset, and Clock Management .....	500
8.1.1	Introduction .....	500
8.1.2	Device Power-Management Architecture Building Blocks .....	500
8.1.3	Clock Management .....	500
8.1.4	Power Management .....	506
8.1.5	PRCM Module Overview .....	517
8.1.6	Clock Generation and Management .....	519
8.1.7	Reset Management .....	535
8.1.8	Power-Up/Down Sequence .....	544
8.1.9	IO State .....	544
8.1.10	Voltage and Power Domains .....	544

8.1.11	Device Modules and Power Management Attributes List .....	545
8.1.12	Clock Module Registers .....	548
8.1.13	Power Management Registers .....	705
<b>9</b>	<b>Control Module .....</b>	<b>746</b>
9.1	Introduction .....	747
9.2	Functional Description .....	747
9.2.1	Control Module Initialization .....	747
9.2.2	Pad Control Registers .....	747
9.2.3	EDMA Event Multiplexing .....	748
9.2.4	Device Control and Status .....	749
9.2.5	DDR PHY .....	756
9.3	CONTROL_MODULE Registers .....	757
9.3.1	control_revision Register (offset = 0h) [reset = 0h] .....	762
9.3.2	control_hwinfo Register (offset = 4h) [reset = 0h] .....	763
9.3.3	control_sysconfig Register (offset = 10h) [reset = 0h] .....	764
9.3.4	control_status Register (offset = 40h) [reset = 0h] .....	765
9.3.5	control_emif_sdram_config Register (offset = 110h) [reset = 0h] .....	766
9.3.6	core_sldo_ctrl Register (offset = 428h) [reset = 0h] .....	768
9.3.7	mpu_sldo_ctrl Register (offset = 42Ch) [reset = 0h] .....	769
9.3.8	clk32kdivratio_ctrl Register (offset = 444h) [reset = 0h] .....	770
9.3.9	bandgap_ctrl Register (offset = 448h) [reset = 0h] .....	771
9.3.10	bandgap_trim Register (offset = 44Ch) [reset = 0h] .....	772
9.3.11	pll_clkinpulow_ctrl Register (offset = 458h) [reset = 0h] .....	773
9.3.12	mosc_ctrl Register (offset = 468h) [reset = 0h] .....	774
9.3.13	deepsleep_ctrl Register (offset = 470h) [reset = 0h] .....	775
9.3.14	dpll_pwr_sw_status (offset = 50Ch) [reset = 0h] .....	776
9.3.15	device_id Register (offset = 600h) [reset = 0x] .....	777
9.3.16	dev_feature Register (offset = 604h) [reset = 0h] .....	778
9.3.17	init_priority_0 Register (offset = 608h) [reset = 0h] .....	779
9.3.18	init_priority_1 Register (offset = 60Ch) [reset = 0h] .....	780
9.3.19	mmu_cfg Register (offset = 610h) [reset = 0h] .....	781
9.3.20	tpc_cfg Register (offset = 614h) [reset = 0h] .....	782
9.3.21	usb_ctrl0 Register (offset = 620h) [reset = 0h] .....	783
9.3.22	usb_sts0 Register (offset = 624h) [reset = 0h] .....	785
9.3.23	usb_ctrl1 Register (offset = 628h) [reset = 0h] .....	786
9.3.24	usb_sts1 Register (offset = 62Ch) [reset = 0h] .....	788
9.3.25	mac_id0_lo Register (offset = 630h) [reset = 0h] .....	789
9.3.26	mac_id0_hi Register (offset = 634h) [reset = 0h] .....	790
9.3.27	mac_id1_lo Register (offset = 638h) [reset = 0h] .....	791
9.3.28	mac_id1_hi Register (offset = 63Ch) [reset = 0h] .....	792
9.3.29	dcan_ramininit Register (offset = 644h) [reset = 0h] .....	793
9.3.30	usb_wkup_ctrl Register (offset = 648h) [reset = 0h] .....	794
9.3.31	gmii_sel Register (offset = 650h) [reset = 0h] .....	795
9.3.32	pwmss_ctrl Register (offset = 664h) [reset = 0h] .....	796
9.3.33	mreqprio_0 Register (offset = 670h) [reset = 0h] .....	797
9.3.34	mreqprio_1 Register (offset = 674h) [reset = 0h] .....	798
9.3.35	hw_event_sel_grp1 Register (offset = 690h) [reset = 0h] .....	799
9.3.36	hw_event_sel_grp2 Register (offset = 694h) [reset = 0h] .....	800
9.3.37	hw_event_sel_grp3 Register (offset = 698h) [reset = 0h] .....	801
9.3.38	hw_event_sel_grp4 Register (offset = 69Ch) [reset = 0h] .....	802
9.3.39	smrt_ctrl Register (offset = 6A0h) [reset = 0h] .....	803
9.3.40	mpuss_hw_debug_sel Register (offset = 6A4h) [reset = 0h] .....	804
9.3.41	mpuss_hw_dbg_info Register (offset = 6A8h) [reset = 0h] .....	805

9.3.42	vdd_mpu_opp_050 Register (offset = 770h) [reset = 0h]	806
9.3.43	vdd_mpu_opp_100 Register (offset = 774h) [reset = 0h]	807
9.3.44	vdd_mpu_opp_120 Register (offset = 778h) [reset = 0h]	808
9.3.45	vdd_mpu_opp_turbo Register (offset = 77Ch) [reset = 0h]	809
9.3.46	vdd_core_opp_050 Register (offset = 7B8h) [reset = 0h]	810
9.3.47	vdd_core_opp_100 Register (offset = 7BCh) [reset = 0h]	811
9.3.48	bb_scale Register (offset = 7D0h) [reset = 0h]	812
9.3.49	usb_vid_pid Register (offset = 7F4h) [reset = 4516141h]	813
9.3.50	efuse_sma Register (offset = 7FCh) [reset = 0h]	814
9.3.51	conf_<module>_<pin> Register (offset = 800h–A34h)	815
9.3.52	cqdetect_status Register (offset = E00h) [reset = 0h]	816
9.3.53	ddr_io_ctrl Register (offset = E04h) [reset = 0h]	817
9.3.54	vtp_ctrl Register (offset = E0Ch) [reset = 0h]	818
9.3.55	vref_ctrl Register (offset = E14h) [reset = 0h]	819
9.3.56	tpcc_evt_mux_0_3 Register (offset = F90h) [reset = 0h]	820
9.3.57	tpcc_evt_mux_4_7 Register (offset = F94h) [reset = 0h]	821
9.3.58	tpcc_evt_mux_8_11 Register (offset = F98h) [reset = 0h]	822
9.3.59	tpcc_evt_mux_12_15 Register (offset = F9Ch) [reset = 0h]	823
9.3.60	tpcc_evt_mux_16_19 Register (offset = FA0h) [reset = 0h]	824
9.3.61	tpcc_evt_mux_20_23 Register (offset = FA4h) [reset = 0h]	825
9.3.62	tpcc_evt_mux_24_27 Register (offset = FA8h) [reset = 0h]	826
9.3.63	tpcc_evt_mux_28_31 Register (offset = FACH) [reset = 0h]	827
9.3.64	tpcc_evt_mux_32_35 Register (offset = FB0h) [reset = 0h]	828
9.3.65	tpcc_evt_mux_36_39 Register (offset = FB4h) [reset = 0h]	829
9.3.66	tpcc_evt_mux_40_43 Register (offset = FB8h) [reset = 0h]	830
9.3.67	tpcc_evt_mux_44_47 Register (offset = FBCh) [reset = 0h]	831
9.3.68	tpcc_evt_mux_48_51 Register (offset = FC0h) [reset = 0h]	832
9.3.69	tpcc_evt_mux_52_55 Register (offset = FC4h) [reset = 0h]	833
9.3.70	tpcc_evt_mux_56_59 Register (offset = FC8h) [reset = 0h]	834
9.3.71	tpcc_evt_mux_60_63 Register (offset = FCCh) [reset = 0h]	835
9.3.72	timer_evt_capt Register (offset = FD0h) [reset = 0h]	836
9.3.73	ecap_evt_capt Register (offset = FD4h) [reset = 0h]	837
9.3.74	adc_evt_capt Register (offset = FD8h) [reset = 0h]	838
9.3.75	reset_iso Register (offset = 1000h) [reset = 0h]	839
9.3.76	dpll_pwr_sw_ctrl Register (offset = 1318h) [reset = 0h]	840
9.3.77	ddr_cke_ctrl Register (offset = 131Ch) [reset = 0h]	842
9.3.78	sma2 Register (offset = 1320h) [reset = 0h]	843
9.3.79	m3_txev_eoi Register (offset = 1324h) [reset = 0h]	844
9.3.80	ipc_msg_reg0 Register (offset = 1328h) [reset = 0h]	845
9.3.81	ipc_msg_reg1 Register (offset = 132Ch) [reset = 0h]	846
9.3.82	ipc_msg_reg2 Register (offset = 1330h) [reset = 0h]	847
9.3.83	ipc_msg_reg3 Register (offset = 1334h) [reset = 0h]	848
9.3.84	ipc_msg_reg4 Register (offset = 1338h) [reset = 0h]	849
9.3.85	ipc_msg_reg5 Register (offset = 133Ch) [reset = 0h]	850
9.3.86	ipc_msg_reg6 Register (offset = 1340h) [reset = 0h]	851
9.3.87	ipc_msg_reg7 Register (offset = 1344h) [reset = 0h]	852
9.3.88	ddr_cmd0_ioctrl Register (offset = 1404h) [reset = 0h]	853
9.3.89	ddr_cmd1_ioctrl Register (offset = 1408h) [reset = 0h]	855
9.3.90	ddr_cmd2_ioctrl Register (offset = 140Ch) [reset = 0h]	857
9.3.91	ddr_data0_ioctrl Register (offset = 1440h) [reset = 0h]	859
9.3.92	ddr_data1_ioctrl Register (offset = 1444h) [reset = 0h]	861
<b>10</b>	<b>Interconnects</b>	<b>863</b>
10.1	Introduction	864

10.1.1	Terminology .....	864
10.1.2	L3 Interconnect .....	864
10.1.3	L4 Interconnect .....	868
<b>11</b>	<b>Enhanced Direct Memory Access (EDMA) .....</b>	<b>869</b>
11.1	Introduction .....	870
11.1.1	EDMA3 Controller Block Diagram .....	870
11.1.2	Third-Party Channel Controller (TPCC) Overview .....	870
11.1.3	Third-Party Transfer Controller (TPTC) Overview .....	871
11.2	Integration .....	873
11.2.1	Third-Party Channel Controller (TPCC) Integration .....	873
11.2.2	Third-Party Transfer Controller (TPTC) Integration .....	874
11.3	Functional Description .....	876
11.3.1	Functional Overview .....	876
11.3.2	Types of EDMA3 Transfers .....	879
11.3.3	Parameter RAM (PaRAM) .....	881
11.3.4	Initiating a DMA Transfer .....	893
11.3.5	Completion of a DMA Transfer .....	896
11.3.6	Event, Channel, and PaRAM Mapping .....	897
11.3.7	EDMA3 Channel Controller Regions .....	899
11.3.8	Chaining EDMA3 Channels .....	901
11.3.9	EDMA3 Interrupts .....	902
11.3.10	Memory Protection .....	908
11.3.11	Event Queue(s) .....	912
11.3.12	EDMA3 Transfer Controller (EDMA3TC) .....	914
11.3.13	Event Dataflow .....	917
11.3.14	EDMA3 Prioritization .....	917
11.3.15	EDMA3 Operating Frequency (Clock Control) .....	918
11.3.16	Reset Considerations .....	918
11.3.17	Power Management .....	918
11.3.18	Emulation Considerations .....	918
11.3.19	EDMA Transfer Examples .....	920
11.3.20	EDMA Events .....	936
11.4	EDMA3 Registers .....	939
11.4.1	EDMA3 Channel Controller Registers .....	939
11.4.2	EDMA3 Transfer Controller Registers .....	993
11.5	Appendix A .....	1018
11.5.1	Debug Checklist .....	1018
11.5.2	Miscellaneous Programming/Debug Tips .....	1019
11.5.3	Setting Up a Transfer .....	1020
<b>12</b>	<b>Touchscreen Controller .....</b>	<b>1022</b>
12.1	Introduction .....	1023
12.1.1	TSC_ADC Features .....	1023
12.1.2	Unsupported TSC_ADC_SS Features .....	1023
12.2	Integration .....	1024
12.2.1	TSC_ADC Connectivity Attributes .....	1024
12.2.2	TSC_ADC Clock and Reset Management .....	1025
12.2.3	TSC_ADC Pin List .....	1025
12.3	Functional Description .....	1026
12.3.1	HW Synchronized or SW Channels .....	1026
12.3.2	Open Delay and Sample Delay .....	1026
12.3.3	Averaging of Samples (1, 2, 4, 8, and 16) .....	1026
12.3.4	One-Shot (Single) or Continuous Mode .....	1026
12.3.5	Interrupts .....	1026

12.3.6	DMA Requests .....	1027
12.3.7	Analog Front End (AFE) Functional Block Diagram .....	1027
12.4	Operational Modes .....	1029
12.4.1	PenCtrl and PenIRQ .....	1030
12.5	Touchscreen Controller Registers .....	1033
12.5.1	TSC_ADC_SS Registers .....	1033
<b>13</b>	<b>LCD Controller .....</b>	<b>1097</b>
13.1	Introduction .....	1098
13.1.1	Purpose of the Peripheral .....	1098
13.1.2	Features .....	1099
13.2	Integration .....	1100
13.2.1	LCD Controller Connectivity Attributes .....	1100
13.2.2	LCD Controller Clock and Reset Management .....	1101
13.2.3	LCD Controller Pin List .....	1101
13.3	Functional Description .....	1102
13.3.1	Clocking .....	1102
13.3.2	LCD External I/O Signals .....	1104
13.3.3	DMA Engine .....	1105
13.3.4	LIDD Controller .....	1106
13.3.5	Raster Controller .....	1108
13.3.6	Interrupt Conditions .....	1119
13.3.7	DMA .....	1121
13.3.8	Power Management .....	1121
13.4	Programming Model .....	1122
13.4.1	LCD Character Displays .....	1122
13.4.2	Active Matrix Displays .....	1125
13.4.3	System Interaction .....	1125
13.4.4	Palette Lookup .....	1125
13.4.5	Test Logic .....	1127
13.4.6	Disable and Software Reset Sequence .....	1127
13.4.7	Precedence Order for Determining Frame Buffer Type .....	1128
13.5	LCD Registers .....	1128
13.5.1	PID Register (offset = 0h) [reset = 0h] .....	1130
13.5.2	CTRL Register (offset = 4h) [reset = 0h] .....	1131
13.5.3	LIDD_CTRL Register (offset = Ch) [reset = 0h] .....	1132
13.5.4	LIDD_CS0_CONF Register (offset = 10h) [reset = 0h] .....	1133
13.5.5	LIDD_CS0_ADDR Register (offset = 14h) [reset = 0h] .....	1134
13.5.6	LIDD_CS0_DATA Register (offset = 18h) [reset = 0h] .....	1135
13.5.7	LIDD_CS1_CONF Register (offset = 1Ch) [reset = 0h] .....	1136
13.5.8	LIDD_CS1_ADDR Register (offset = 20h) [reset = 0h] .....	1137
13.5.9	LIDD_CS1_DATA Register (offset = 24h) [reset = 0h] .....	1138
13.5.10	RASTER_CTRL Register (offset = 28h) [reset = 0h] .....	1139
13.5.11	RASTER_TIMING_0 Register (offset = 2Ch) [reset = 0h] .....	1141
13.5.12	RASTER_TIMING_1 Register (offset = 30h) [reset = 0h] .....	1142
13.5.13	RASTER_TIMING_2 Register (offset = 34h) [reset = 0h] .....	1143
13.5.14	RASTER_SUBPANEL Register (offset = 38h) [reset = 0h] .....	1145
13.5.15	RASTER_SUBPANEL2 Register (offset = 3Ch) [reset = 0h] .....	1146
13.5.16	LCDDMA_CTRL Register (offset = 40h) [reset = 0h] .....	1147
13.5.17	LCDDMA_FB0_BASE Register (offset = 44h) [reset = 0h] .....	1148
13.5.18	LCDDMA_FB0_CEILING Register (offset = 48h) [reset = 0h] .....	1149
13.5.19	LCDDMA_FB1_BASE Register (offset = 4Ch) [reset = 0h] .....	1150
13.5.20	LCDDMA_FB1_CEILING Register (offset = 50h) [reset = 0h] .....	1151
13.5.21	SYSCONFIG Register (offset = 54h) [reset = 0h] .....	1152

13.5.22	IRQSTATUS_RAW Register (offset = 58h) [reset = 0h]	1153
13.5.23	IRQSTATUS Register (offset = 5Ch) [reset = 0h]	1155
13.5.24	IRQENABLE_SET Register (offset = 60h) [reset = 0h]	1157
13.5.25	IRQENABLE_CLEAR Register (offset = 64h) [reset = 0h]	1159
13.5.26	CLKC_ENABLE Register (offset = 6Ch) [reset = 0h]	1161

## List of Figures

3-1.	Microprocessor Unit (MPU) Subsystem.....	165
3-2.	Microprocessor Unit (MPU) Subsystem Signal Interface .....	167
3-3.	MPU Subsystem Clocking Scheme .....	168
3-4.	Reset Scheme of the MPU Subsystem .....	169
3-5.	MPU Subsystem Power Domain Overview.....	172
5-1.	SGX530 Integration.....	182
5-2.	SGX Block Diagram .....	184
6-1.	Interrupt Controller Block Diagram .....	187
6-2.	IRQ/FIQ Processing Sequence .....	193
6-3.	Nested IRQ/FIQ Processing Sequence .....	197
6-4.	INTC_REVISION Register .....	206
6-5.	INTC_SYSCONFIG Register.....	207
6-6.	INTC_SYSSTATUS Register.....	208
6-7.	INTC_SIR_IRQ Register .....	209
6-8.	INTC_SIR_FIQ Register .....	210
6-9.	INTC_CONTROL Register.....	211
6-10.	INTC_PROTECTION Register .....	212
6-11.	INTC_IDLE Register.....	213
6-12.	INTC_IRQ_PRIORITY Register.....	214
6-13.	INTC_FIQ_PRIORITY Register .....	215
6-14.	INTC_THRESHOLD Register .....	216
6-15.	INTC_ITR0 Register .....	217
6-16.	INTC_MIR0 Register .....	218
6-17.	INTC_MIR_CLEAR0 Register.....	219
6-18.	INTC_MIR_SET0 Register.....	220
6-19.	INTC_ISR_SET0 Register .....	221
6-20.	INTC_ISR_CLEAR0 Register .....	222
6-21.	INTC_PENDING_IRQ0 Register.....	223
6-22.	INTC_PENDING_FIQ0 Register .....	224
6-23.	INTC_ITR1 Register .....	225
6-24.	INTC_MIR1 Register .....	226
6-25.	INTC_MIR_CLEAR1 Register.....	227
6-26.	INTC_MIR_SET1 Register.....	228
6-27.	INTC_ISR_SET1 Register .....	229
6-28.	INTC_ISR_CLEAR1 Register .....	230
6-29.	INTC_PENDING_IRQ1 Register.....	231
6-30.	INTC_PENDING_FIQ1 Register .....	232
6-31.	INTC_ITR2 Register .....	233
6-32.	INTC_MIR2 Register .....	234
6-33.	INTC_MIR_CLEAR2 Register.....	235
6-34.	INTC_MIR_SET2 Register.....	236
6-35.	INTC_ISR_SET2 Register .....	237
6-36.	INTC_ISR_CLEAR2 Register .....	238
6-37.	INTC_PENDING_IRQ2 Register.....	239
6-38.	INTC_PENDING_FIQ2 Register .....	240
6-39.	INTC_ITR3 Register .....	241
6-40.	INTC_MIR3 Register .....	242

6-41.	INTC_MIR_CLEAR3 Register .....	243
6-42.	INTC_MIR_SET3 Register.....	244
6-43.	INTC_ISR_SET3 Register .....	245
6-44.	INTC_ISR_CLEAR3 Register .....	246
6-45.	INTC_PENDING_IRQ3 Register.....	247
6-46.	INTC_PENDING_FIQ3 Register .....	248
6-47.	INTC_ILR0 to INTC_ILR127 Register.....	249
7-1.	GPMC Block Diagram .....	253
7-2.	GPMC Integration.....	254
7-3.	GPMC to 16-Bit Address/Data-Multiplexed Memory .....	258
7-4.	GPMC to 16-Bit Non-multiplexed Memory.....	259
7-5.	GPMC to 8-Bit NAND Device .....	259
7-6.	Chip-Select Address Mapping and Decoding Mask.....	264
7-7.	Wait Behavior During an Asynchronous Single Read Access (GPMCFCLKDivider = 1) .....	267
7-8.	Wait Behavior During a Synchronous Read Burst Access .....	269
7-9.	Read to Read for an Address-Data Multiplexed Device, On Different CS, Without Bus Turnaround (CS0n Attached to Fast Device).....	271
7-10.	Read to Read / Write for an Address-Data Multiplexed Device, On Different CS, With Bus Turnaround....	271
7-11.	Read to Read / Write for a Address-Data or AAD-Multiplexed Device, On Same CS, With Bus Turnaround.....	272
7-12.	Asynchronous Single Read Operation on an Address/Data Multiplexed Device .....	281
7-13.	Two Asynchronous Single Read Accesses on an Address/Data Multiplexed Device (32-Bit Read Split Into 2 x 16-Bit Read) .....	282
7-14.	Asynchronous Single Write on an Address/Data-Multiplexed Device.....	283
7-15.	Asynchronous Single-Read on an AAD-Multiplexed Device .....	284
7-16.	Asynchronous Single Write on an AAD-Multiplexed Device .....	286
7-17.	Synchronous Single Read (GPMCFCLKDIVIDER = 0) .....	288
7-18.	Synchronous Single Read (GPMCFCLKDIVIDER = 1) .....	289
7-19.	Synchronous Multiple (Burst) Read (GPMCFCLKDIVIDER = 0) .....	291
7-20.	Synchronous Multiple (Burst) Read (GPMCFCLKDIVIDER = 1) .....	292
7-21.	Synchronous Single Write on an Address/Data-Multiplexed Device .....	293
7-22.	Synchronous Multiple Write (Burst Write) in Address/Data-Multiplexed Mode .....	294
7-23.	Synchronous Multiple Write (Burst Write) in Address/Address/Data-Multiplexed Mode.....	295
7-24.	Asynchronous Single Read on an Address/Data-Nonmultiplexed Device .....	297
7-25.	Asynchronous Single Write on an Address/Data-Nonmultiplexed Device.....	298
7-26.	Asynchronous Multiple (Page Mode) Read.....	299
7-27.	NAND Command Latch Cycle.....	304
7-28.	NAND Address Latch Cycle .....	305
7-29.	NAND Data Read Cycle .....	306
7-30.	NAND Data Write Cycle.....	307
7-31.	Hamming Code Accumulation Algorithm (1 of 2) .....	311
7-32.	Hamming Code Accumulation Algorithm (2 of 2) .....	312
7-33.	ECC Computation for a 256-Byte Data Stream (Read or Write) .....	312
7-34.	ECC Computation for a 512-Byte Data Stream (Read or Write) .....	313
7-35.	128 Word16 ECC Computation .....	314
7-36.	256 Word16 ECC Computation .....	314
7-37.	Manual Mode Sequence and Mapping.....	319
7-38.	NAND Page Mapping and ECC: Per-Sector Schemes .....	324
7-39.	NAND Page Mapping and ECC: Pooled Spare Schemes.....	325
7-40.	NAND Page Mapping and ECC: Per-Sector Schemes, with Separate ECC.....	326

7-41.	NAND Read Cycle Optimization Timing Description .....	333
7-42.	Programming Model Top-Level Diagram .....	336
7-43.	NOR Interfacing Timing Parameters Diagram .....	343
7-44.	NAND Command Latch Cycle Timing Simplified Example .....	347
7-45.	Synchronous NOR Single Read Simplified Example.....	352
7-46.	Asynchronous NOR Single Write Simplified Example .....	354
7-47.	GPMC Connection to an External NOR Flash Memory.....	356
7-48.	Synchronous Burst Read Access (Timing Parameters in Clock Cycles) .....	358
7-49.	Asynchronous Single Read Access (Timing Parameters in Clock Cycles) .....	360
7-50.	Asynchronous Single Write Access (Timing Parameters in Clock Cycles).....	362
7-51.	GPMC_REVISION .....	367
7-52.	GPMC_SYSCONFIG .....	367
7-53.	GPMC_SYSSTATUS.....	368
7-54.	GPMC_IRQSTATUS .....	369
7-55.	GPMC_IRQENABLE .....	370
7-56.	GPMC_TIMEOUT_CONTROL .....	371
7-57.	GPMC_ERR_ADDRESS.....	371
7-58.	GPMC_ERR_TYPE.....	372
7-59.	GPMC_CONFIG .....	373
7-60.	GPMC_STATUS .....	374
7-61.	GPMC_CONFIG1_i.....	375
7-62.	GPMC_CONFIG2_i.....	377
7-63.	GPMC_CONFIG3_i.....	378
7-64.	GPMC_CONFIG4_i.....	380
7-65.	GPMC_CONFIG5_i.....	382
7-66.	GPMC_CONFIG6_i.....	383
7-67.	GPMC_CONFIG7_i.....	384
7-68.	GPMC_NAND_COMMAND_i .....	385
7-69.	GPMC_NAND_ADDRESS_i.....	385
7-70.	GPMC_NAND_DATA_i .....	385
7-71.	GPMC_PREFETCH_CONFIG1 .....	386
7-72.	GPMC_PREFETCH_CONFIG2.....	388
7-73.	GPMC_PREFETCH_CONTROL.....	388
7-74.	GPMC_PREFETCH_STATUS .....	389
7-75.	GPMC_ECC_CONFIG .....	390
7-76.	GPMC_ECC_CONTROL .....	391
7-77.	GPMC_ECC_SIZE_CONFIG.....	392
7-78.	GPMC_ECCj_RESULT .....	394
7-79.	GPMC_BCH_RESULT0_i .....	395
7-80.	GPMC_BCH_RESULT1_i .....	395
7-81.	GPMC_BCH_RESULT2_i .....	395
7-82.	GPMC_BCH_RESULT3_i .....	396
7-83.	GPMC_BCH_SWDATA .....	396
7-84.	GPMC_BCH_RESULT4_i .....	396
7-85.	GPMC_BCH_RESULT5_i .....	397
7-86.	GPMC_BCH_RESULT6_i .....	397
7-87.	OCMC RAM Integration.....	399
7-88.	DDR2/3/mDDR Memory Controller Signals .....	404
7-89.	DDR2/3/mDDR Subsystem Block Diagram .....	406

7-90.	DDR2/3/mDDR Memory Controller FIFO Block Diagram.....	407

15-57. Buck Waveforms for (Note: Only three bucks shown here) .....	1560
15-58. Control of Four Buck Stages. (Note: $F_{P_{PWM2}} = N \times F_{P_{PWM1}}$ ) .....	1562
15-59. Buck Waveforms for (Note: $F_{P_{PWM2}} = F_{P_{PWM1}}$ ) .....	1563
15-60. Control of Two Half-H Bridge Stages ( $F_{P_{PWM2}} = N \times F_{P_{PWM1}}$ ) .....	1565
15-61. Half-H Bridge Waveforms for (Note: Here $F_{P_{PWM2}} = F_{P_{PWM1}}$ ) .....	1566
15-62. Control of Dual 3-Phase Inverter Stages as Is Commonly Used in Motor Control .....	1568
15-63. 3-Phase Inverter Waveforms for (Only One Inverter Shown) .....	1569
15-64. Configuring Two PWM Modules for Phase Control .....	1572
15-65. Timing Waveforms Associated With Phase Control Between 2 Modules .....	1573
15-66. Control of a 3-Phase Interleaved DC/DC Converter .....	1574
15-67. 3-Phase Interleaved DC/DC Converter Waveforms for .....	1575
15-68. Controlling a Full-H Bridge Stage ( $F_{P_{PWM2}} = F_{P_{PWM1}}$ ) .....	1578
15-69. ZVS Full-H Bridge Waveforms .....	1579
15-70. Time-Base Control Register (TBCTL) .....	1582
15-71. Time-Base Status Register (TBSTS) .....	1584
15-72. Time-Base Phase Register (TBPHS) .....	1584
15-73. Time-Base Counter Register (TBCNT) .....	1585
15-74. Time-Base Period Register (TBPRD) .....	1586
15-75. Counter-Compare Control Register (CMPCTL) .....	1587

15-76. Counter-Compare A Register (CMPA) .....	1588
15-77. Counter-Compare B Register (CMPB).....	1589
15-78. Action-Qualifier Output A Control Register (AQCTLA) .....	1590
15-79. Action-Qualifier Output B Control Register (AQCTLB) .....	1591
15-80. Action-Qualifier Software Force Register (AQSFRC).....	1592
15-81. Action-Qualifier Continuous Software Force Register (AQCSFRC) .....	1593
15-82. Dead-Band Generator Control Register (DBCTL).....	1594
15-83. Dead-Band Generator Rising Edge Delay Register (DBRED) .....	1595
15-84. Dead-Band Generator Falling Edge Delay Register (DBFED) .....	1595
15-85. Trip-Zone Select Register (TZSEL) .....	1596
15-86. Trip-Zone Control Register (TZCTL).....	1597
15-87. Trip-Zone Enable Interrupt Register (TZEINT) .....	1597
15-88. Trip-Zone Flag Register (TZFLG) .....	1598
15-89. Trip-Zone Clear Register (TZCLR).....	1599
15-90. Trip-Zone Force Register (TZFRC) .....	1599
15-91. Event-Trigger Selection Register (ETSEL).....	1600
15-92. Event-Trigger Prescale Register (ETPS).....	1601
15-93. Event-Trigger Flag Register (ETFLG) .....	1602
15-94. Event-Trigger Clear Register (ETCLR) .....	1602
15-95. Event-Trigger Force Register (ETFRC) .....	1603
15-96. PWM-Chopper Control Register (PCCTL) .....	1604
15-97. Time-Base Phase High-Resolution Register (TBPHSHR) .....	1605
15-98. Counter-Compare A High-Resolution Register (CMPAHR).....	1605
15-99. HRPWM Control Register (HRCTL).....	1606
15-100. Multiple eCAP Modules .....	1608
15-101. Capture and APWM Modes of Operation .....	1609
15-102. Capture Function Diagram .....	1610
15-103. Event Prescale Control .....	1611
15-104. Prescale Function Waveforms .....	1611
15-105. Continuous/One-shot Block Diagram .....	1612
15-106. Counter and Synchronization Block Diagram .....	1613
15-107. Interrupts in eCAP Module.....	1615
15-108. PWM Waveform Details Of APWM Mode Operation .....	1616
15-109. Capture Sequence for Absolute Time-Stamp, Rising Edge Detect.....	1619
15-110. Capture Sequence for Absolute Time-Stamp, Rising and Falling Edge Detect.....	1621
15-111. Capture Sequence for Delta Mode Time-Stamp, Rising Edge Detect .....	1623
15-112. Capture Sequence for Delta Mode Time-Stamp, Rising and Falling Edge Detect .....	1625
15-113. PWM Waveform Details of APWM Mode Operation.....	1627
15-114. Multichannel PWM Example Using 4 eCAP Modules .....	1629
15-115. Multiphase (channel) Interleaved PWM Example Using 3 eCAP Modules .....	1632
15-116. TSCTR Register.....	1635
15-117. CTRPHS Register.....	1636
15-118. CAP1 Register.....	1637
15-119. CAP2 Register.....	1638
15-120. CAP3 Register.....	1639
15-121. CAP4 Register.....	1640
15-122. ECCTL1 Register .....	1641
15-123. ECCTL2 Register .....	1643
15-124. ECEINT Register .....	1645

15-125. ECFLG Register .....	1646
15-126. ECCLR Register .....	1647
15-127. ECFRC Register .....	1648
15-128. REVID Register .....	1649
15-129. Optical Encoder Disk .....	1650
15-130. QEP Encoder Output Signal for Forward/Reverse Movement .....	1651
15-131. Index Pulse Example .....	1651
15-132. Functional Block Diagram of the eQEP Peripheral .....	1654
15-133. Functional Block Diagram of Decoder Unit .....	1655
15-134. Quadrature Decoder State Machine .....	1657
15-135. Quadrature-clock and Direction Decoding .....	1657
15-136. Position Counter Reset by Index Pulse for 1000 Line Encoder (QPOSMAX = 3999 or F9Fh) .....	1659
15-137. Position Counter Underflow/Overflow (QPOSMAX = 4) .....	1660
15-138. Software Index Marker for 1000-line Encoder (QEPCTL[IEL] = 1) .....	1662
15-139. Strobe Event Latch (QEPCTL[SEL] = 1) .....	1663
15-140. eQEP Position-compare Unit .....	1664
15-141. eQEP Position-compare Event Generation Points .....	1665
15-142. eQEP Position-compare Sync Output Pulse Stretcher .....	1665
15-143. eQEP Edge Capture Unit .....	1667
15-144. Unit Position Event for Low Speed Measurement (QCAPCTL[UPPS] = 0010) .....	1667
15-145. eQEP Edge Capture Unit - Timing Details .....	1668
15-146. eQEP Watchdog Timer .....	1669
15-147. eQEP Unit Time Base .....	1670
15-148. EQEP Interrupt Generation .....	1670
15-149. eQEP Position Counter Register (QPOSCNT) .....	1673
15-150. eQEP Position Counter Initialization Register (QPOSINIT) .....	1673
15-151. eQEP Maximum Position Count Register (QPOSMAX) .....	1673
15-152. eQEP Position-Compare Register (QPOSCMP) .....	1674
15-153. eQEP Index Position Latch Register (QPOSILAT) .....	1674
15-154. eQEP Strobe Position Latch Register (QPOSSLAT) .....	1674
15-155. eQEP Position Counter Latch Register (QPOSLAT) .....	1675
15-156. eQEP Unit Timer Register (QUTMR) .....	1675
15-157. eQEP Unit Period Register (QUPRD) .....	1675
15-158. eQEP Watchdog Timer Register (QWDTMR) .....	1676
15-159. eQEP Watchdog Period Register (QWDPRD) .....	1676
15-160. QEP Decoder Control Register (QDECCTL) .....	1677
15-161. eQEP Control Register (QEPCTL) .....	1678
15-162. eQEP Capture Control Register (QCAPCTL) .....	1680
15-163. eQEP Position-Compare Control Register (QPOSCTL) .....	1681
15-164. eQEP Interrupt Enable Register (QEINT) .....	1682
15-165. eQEP Interrupt Flag Register (QFLG) .....	1683
15-166. eQEP Interrupt Clear Register (QCLR) .....	1684
15-167. eQEP Interrupt Force Register (QFRC) .....	1686
15-168. eQEP Status Register (QEPSTS) .....	1687
15-169. eQEP Capture Timer Register (QCTMR) .....	1688
15-170. eQEP Capture Period Register (QCPRD) .....	1688
15-171. eQEP Capture Timer Latch Register (QCTMRLAT) .....	1688
15-172. eQEP Capture Period Latch Register (QCPRDLAT) .....	1689
15-173. eQEP Revision ID Register (REVID) .....	1689

16-1. USB Integration .....	1694
16-2. USB GPIO Integration .....	1696
16-3. CPU Actions at Transfer Phases .....	1704
16-4. Sequence of Transfer .....	1705
16-5. Flow Chart of Setup Stage of a Control Transfer in Peripheral Mode .....	1707
16-6. Flow Chart of Transmit Data Stage of a Control Transfer in Peripheral Mode .....	1708
16-7. Flow Chart of Receive Data Stage of a Control Transfer in Peripheral Mode.....	1709
16-8. Flow Chart of Setup Stage of a Control Transfer in Host Mode.....	1720
16-9. Flow Chart of Data Stage (IN Data Phase) of a Control Transfer in Host Mode.....	1721
16-10. Flow Chart of Data Stage (OUT Data Phase) of a Control Transfer in Host Mode.....	1723
16-11. Flow Chart of Status Stage of Zero Data Request or Write Request of a Control Transfer in Host Mode .	1724
16-12. Chart of Status Stage of a Read Request of a Control Transfer in Host Mode .....	1726

### **About This Manual**

This Technical Reference Manual (TRM) details the integration, the environment, the functional description, and the programming models for each peripheral and subsystem in the device

### **Related Documentation From Texas Instruments**

For a complete listing of related documentation and development-support tools, visit [www.ti.com](http://www.ti.com).

## Introduction

### 1.1 AM335x Family

#### 1.1.1 Device Features

This architecture is configured with different sets of features in different devices. This technical reference manual details all of the features available in current and future AM335x devices. Some features may not be available or supported in your particular device. The features supported across different AM335x devices are shown in [Table 1-1](#). For more information on the different packages, refer to your device-specific data manual.

**Table 1-1. Device Features**

Subsystem/ Co-Processor/ Peripheral	AM3352	AM3354	AM3356	AM3357	AM3358	AM3359
<a href="#">ARM MPU Subsystem</a>	Y	Y	Y	Y	Y	Y

### 1.1.2 Device Identification

Several registers help identify the type and available features of the device. [Table 1-2](#) summarizes these registers.

**Table 1-2. Device\_ID (Address 0x44E10600) Bit Field Descriptions**

Bit	Field	Value	Description
31-28	DEVREV		Device revision 0000b - Silicon Revision 1.0 0001b - Silicon Revision 2.0 0010b - Silicon Revision 2.1 See device errata for detailed information on functionality in each device revision. Reset value is revision-dependent.
27-12	PARTNUM		Device part number 0xB944
11-1	MFGR		Manufacturer's ID 0x017
0	Reserved		Read always as 0 0x0

### 1.1.3 Feature Identification

The AM335x has many different feature sets available. The DEV\_FEATURE register in the control module identifies which features are available in each device in the AM335x family. See [Table 1-3](#), *dev\_feature Register*, in the control module chapter for more information on the bits in the DEV\_FEATURE register.

**Table 1-3. DEV\_FEATURE (Address 0x44E10604) Register Values**

Bit	3 1	3 0	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	Register Value			
Bit Definition	Reserved		SGX	Reserved												ICSSFEA		Reserved						DCAN		Reserved						CPSSW		ICSS		
AM3352	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	0	0	0	0	0	0	0	0	1	1	1	0	0	0	0	0	0	1	0	0x00FC0382

## 1.2 Silicon Revision Functional Differences and Enhancements

This section describes the differences in functionality among different silicon revisions of AM335x. Enhancements introduced in silicon revisions are also described. For a description of silicon bugs that were fixed in later revisions of the device, see *AM335x ARM Cortex-A8 Microprocessors (MPUs) Silicon Errata* (literature number [SPRZ360](#)). Errata items that were fixed may or may not show up in this section.

### 1.2.1 Added RTC Alarm Wakeup for DeepSleep Modes

See [Section 8.1.4.5](#), *Wakeup Sources/Events*.

PG1.0: RTC alarm will not wake up device from DeepSleep0.

PG2.x: RTC alarm was added as a wake-up source from DeepSleep modes.

### 1.2.2 Changed BOOTP Identifier

See [Section 26.1.8.4.2](#), *BOOTP (RFC 951)* and Errata Advisory 1.0.8.

PG1.0: BOOTP Identifier string is "DM814x ROM v1.0".

PG2.x: BOOTP Identifier string is "AM335x ROM".

### 1.2.3 Changed Product String in USB Descriptor

See [Section 26.1.8.6.1.2](#), *Enumeration Descriptors*.

PG1.0: Product string in USB descriptor is "Subarctic".

PG2.x: Product string in USB descriptor is "AM335x USB".

### 1.2.4 Added DPLL Power Switch Control and Status Registers

See [Section 9.3.14](#), *dpll\_pwr\_sw\_status Register*, and [Section 9.3.76](#), *dpll\_pwr\_sw\_ctrl Register*.

PG1.0: DPLL Power Switch Control and Status registers do not exist.

PG2.x: Added DPLL Power Switch Control and DPLL Power Switch Status registers in the Control Module to facilitate power optimization.

### 1.2.5 Added Control for CORE SRAM LDO Retention Mode

See newly added SMA2 register, [Section 9.3.78](#).

PG1.0: SMA2 register does not exist.

PG2.x: Added SMA2.VSLDO\_CORE\_AUTO\_RAMP\_EN.

### 1.2.6 Added Pin Mux Options for GPMC\_A9 to Facilitate RMI2 Pin Muxing

See newly added SMA2 register, [Section 9.3.78](#).

PG1.0: SMA2 register does not exist.

PG2.x: Added SMA2.RMII2\_CRS\_DV\_MODE\_SEL.

### 1.2.7 Changed Polarity of Input Signal nNMI (Pin EXTINTn)

See [Section 6.3](#), *ARM Cortex-A8 Interrupts* and Errata Advisory 1.0.6.

PG1.0: nNMI input signal is active high.

PG2.x: nNMI input signal is active low.

### **1.2.8 Changed Default Value of *ncin* and *pcin* Bits in *vtp\_ctrl* Register**

See [Section 9.3.54](#), *vtp\_ctrl* Register.

PG1.0: VTP\_CTRL.NCIN and VTP\_CTRL.PCIN reset value is 0.

PG2.x: VTP\_CTRL.NCIN and VTP\_CTRL.PCIN reset value is 1.

### **1.2.9 Changed Default Value of *RGMII* Mode to No Internal Delay**

See [Section 9.3.31](#), *gmii\_sel* Register and Errata Advisory 1.0.10.

PG1.0: RGMII1\_IDMODE And RGMII2\_IDMODE reset value is 0.

PG2.x: RGMII1\_IDMODE And RGMII2\_IDMODE reset value is 1.

### **1.2.10 Changed Default Value of *RMII* Clock Source**

See [Section 9.3.31](#), *gmii\_sel* Register and Errata Advisory 1.0.18.

PG1.0: RMII1\_IO\_CLK\_EN and RMII2\_IO\_CLK\_EN reset value is 0.

PG2.x: RMII1\_IO\_CLK\_EN and RMII2\_IO\_CLK\_EN reset value is 1.

### **1.2.11 Changed the Method of Determining Speed of Operation During *EMAC* Boot**

See [Section 26.1.8.4](#), *EMAC Boot Procedure* and Errata Advisory 1.0.7.

PG1.0: Link speed is determined by CONTROL register bit 6 in the external ethernet PHY. Note that some PHYs may not update this bit, as it is not necessary as described in the 802.3 specification.

PG2.x: Link speed is determined by reading the Auto-Negotiation Advertisement and Auto-Negotiation Link Partner Base Page Ability registers in the external ethernet PHY.

### **1.2.12 Added *EFUSE\_SMA* Register for Help Identifying Different Device Variants**

See [Section 9.3.50](#), *efuse\_sma* Register.

PG1.0: EFUSE\_SMA register value is not applicable. Value is always 0.

PG2.x: Added EFUSE\_SMA description to distinguish package type and maximum ARM frequency of the device.

## Memory Map

This sections describes the memory map for the device.

### 2.1 ARM Cortex-A8 Memory Map

**Table 2-1. L3 Memory Map**

## **ARM MPU Subsystem**

---

---

---

This chapter describes the MPU Subsystem for the device.

Topic	Page
3.1 ARM Cortex-A8 MPU Subsystem .....	165

### 3.1 ARM Cortex-A8 MPU Subsystem

The Microprocessor Unit (MPU) subsystem of the device handles transactions between the ARM core (ARM® Cortex™-A8 Processor), the L3 interconnect, and the interrupt controller (INTC). The MPU subsystem is a hard macro that integrates the ARM® Cortex™-A8 Processor with additional logic for protocol conversion, emulation, interrupt handling, and debug enhancements.

Cortex™-A8 is an ARMv7 compatible, dual-issue, in-order execution engine with integrated L1 and L2 caches with NEON™ SIMD Media Processing Unit.

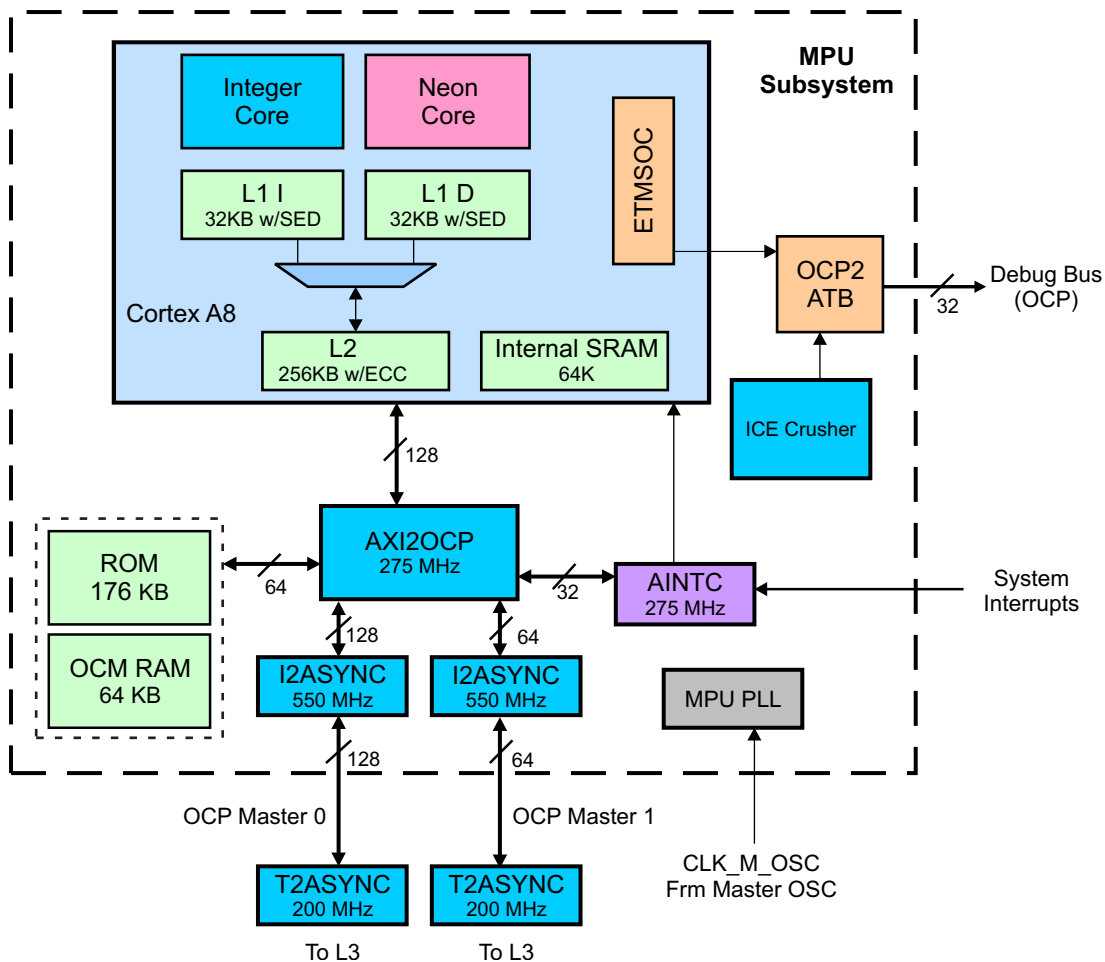

An Interrupt Controller is included in the MPU subsystem to handle host interrupt requests in the system.

The MPU subsystem includes CoreSight compliant logic to allow the Debug Sub-system access to the CortexA8 debug and emulation resources, including the Embedded Trace Macrocell.

The MPU subsystem has three functional clock domains, including a high-frequency clock domain used by the Cortex™-A8. The high-frequency domain is isolated from the rest of the system by asynchronous bridges.

Figure 3-1 shows the high-level block diagram of the MPU subsystem.

**Figure 3-1. Microprocessor Unit (MPU) Subsystem**

### 3.1.1 Features

This section outlines the key features of the MPU subsystem:

- ARM Microprocessor
  - CortexA8
  - ARM Architecture version 7 ISA.
  - 2-issue, in-order execution pipeline.
  - L1 and L2 Instruction and Data Cache of 32 KB , 4-way, 16 word line with 128 bit interface.
  - Integrated L2 cache of 256 KB, 8-way, 16 word line, 128 bit interface to L1 along with ECC/Parity supported.
  - Includes the Neon Media coprocessor (NEON™) which implements the Advanced SIMD media processing architecture.
  - Includes the VFP coprocessor which implements the VFPv3 architecture and is fully compliant with IEEE 754 standard.
  - The external interface uses the AXI protocol configured to 128-bit data width.
  - Includes the Embedded Trace Macrocell (ETM) support for non-invasive debugging.
  - Implements the ARMv7 debug with watch-point and breakpoint registers and 32-bit Advanced Peripheral Bus (APB) slave interface to CoreSight debug systems.
- AXI2OCP Bridge
  - Support OCP 2.2.
  - Single Request Multiple Data Protocol on two ports.
  - Multiple targets, including three OCP ports (128-bit, 64-bit and 32-bit).
- Interrupt Controller
  - Support up to 128 interrupt requests
- Emulation/Debug
  - Compatible with CoreSight Architecture.
- Clock Generation
  - Through PRCM
- DFT
  - Integrated PBIST controller to test L2 tag and data ram, L1I and L1D data ram and OCM RAM.

### 3.1.2 MPU Subsystem Integration

The MPU subsystem integrates the following group of submodules:

**ARM® Cortex™-A8 Processor:** Provides a high processing capability, including the NEON technology for mobile multimedia acceleration. The ARM communicates through an AXI bus with the AXI2OCP bridge and receives interrupts from the MPU subsystem interrupt controller (MPU INTC).

**Interrupt controller:** Handles the module interrupts (for details, see [Chapter 6, Interrupts](#)).

**AXI2OCP bridge:** Allows communication between the ARM (AXI), the INTC (OCP), and the modules (OCP L3).

**I2Async bridge:** This is an asynchronous bridge interface providing an asynchronous OCP to OCP interface. This interface is between the AXI2OCP bridge within the MPU subsystem and the T2Async bridge external to the MPU subsystem.

**Clock Divider:** Provides the required divided clocks to the internal modules of the MPU subsystem and has a clock input from SYSCLK2 which is fed by the power, reset, and clock management (PRCM) module of the device.

**In-Circuit Emulator:** It is fully Compatible with CoreSight Architecture and enables debugging capabilities.

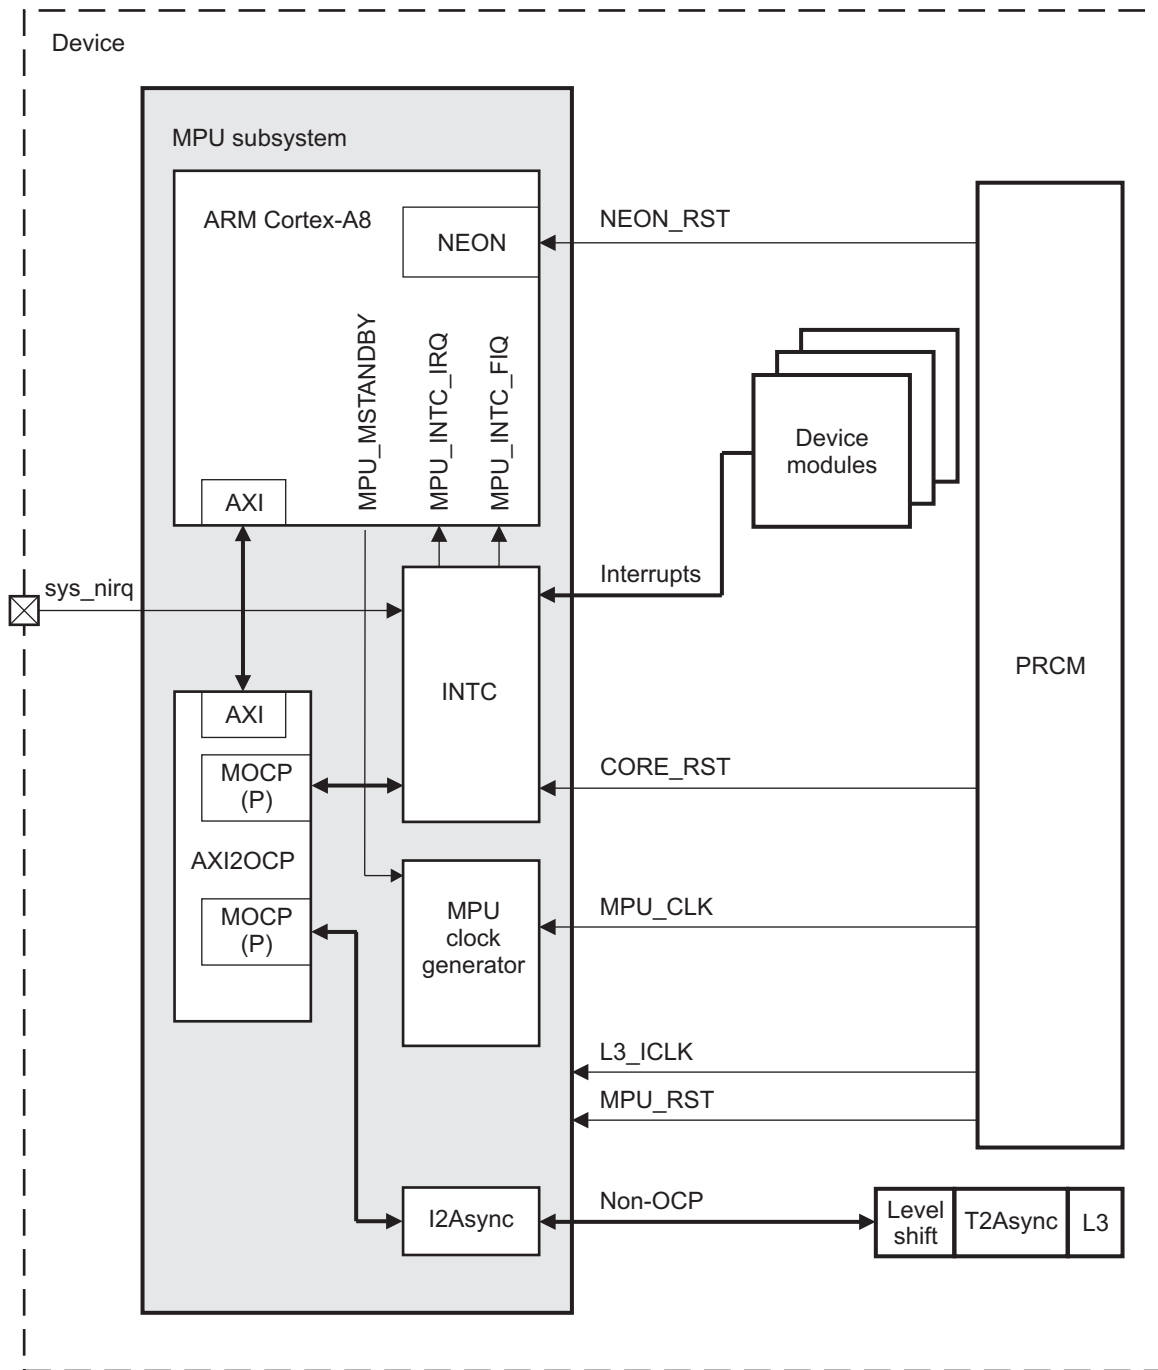

Figure 3-2. Microprocessor Unit (MPU) Subsystem Signal Interface

### 3.1.3 MPU Subsystem Clock and Reset Distribution

#### 3.1.3.1 Clock Distribution

The MPU subsystem includes an embedded DPLL which sources the clock for the ARM Cortex-A8 processor. A clock divider within the subsystem is used for deriving the clocks for other internal modules.

All major modules inside the MPU subsystem are clocked at half the frequency of the ARM core. The divider of the output clock can be programmed with the PRCM.CM\_CLKSEL2\_PLL\_MPU[4:0]MPU\_DPLL\_CLKOUT\_DIV register field, the frequency is relative to the ARM core. For details see the Power, Reset, and Clock Management (PRCM) chapter.

The clock generator generates the following functional clocks:

**ARM (ARM\_FCLK):** This is the core clock. It is the base fast clock that is routed internally to the ARM logic and internal RAMs, including NEON, L2 cache, the ETM core (emulation), and the ARM core.

**AXI2OCP Clock (AXI\_FCLK):** This clock is half the frequency of the ARM clock (ARM\_FCLK). The OCP interface thus performs at one half the frequency of ARM.

**Interrupt Controller Functional Clock (MPU\_INTC\_FCLK):** This clock, which is part of the INTC module, is half the frequency of the ARM clock (ARM\_FCLK).

**ICE-Crusher Functional Clock (ICECRUSHER\_FCLK):** ICE-Crusher clocking operates on the APB interface, using the ARM core clocking. This clock is half the frequency of the ARM clock (ARM\_FCLK).

**I2Async Clock (I2ASYNC\_FCLK):** This clock is half the frequency of the ARM clock (ARM\_FCLK). It matches the OCP interface of the AXI2OCP bridge.

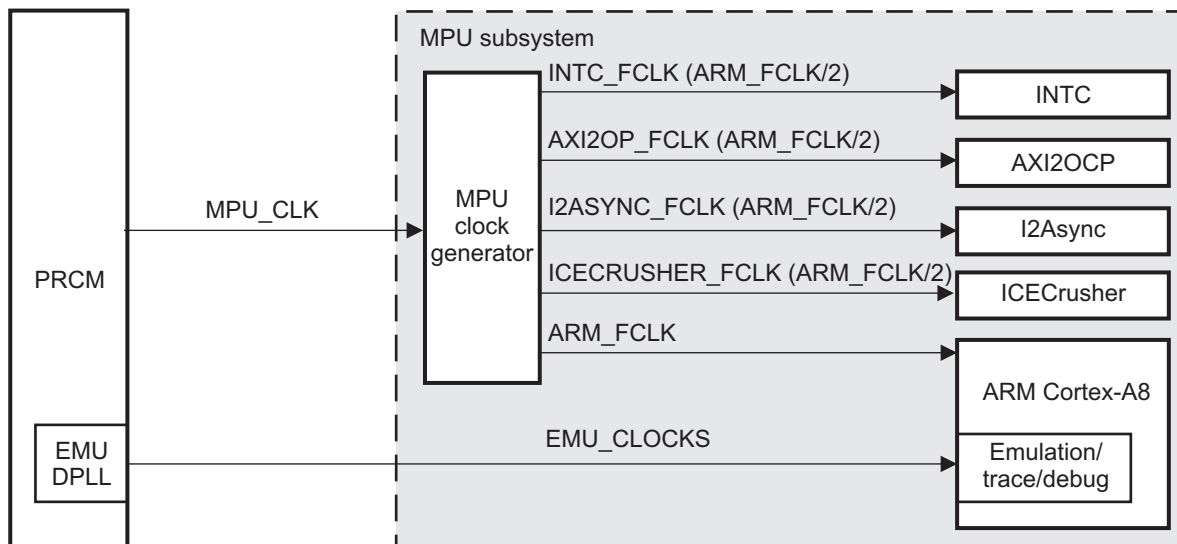

---

**NOTE:** The second half of the asynchronous bridge (T2ASYNC) is clocked directly by the PRCM with the core clock. T2ASYNC is not part of the MPU subsystem.

---

**Emulation Clocking:** Emulation clocks are distributed by the PRCM module and are asynchronous to the ARM core clock (ARM\_FCLK) and can run at a maximum of 1/3 the ARM core clock.

Table [Table 3-1](#) summarizes the clocks generated in the MPU subsystem by the MPU clock generator.

**Figure 3-3. MPU Subsystem Clocking Scheme**

**Table 3-1. MPU Subsystem Clock Frequencies**

Clock signal	Frequency
Cortex A8 Core Functional Clock	MPU_CLK
AXI2OCP Bridge Functional Clock	MPU_CLK / 2
Device Clock	MPU_CLK / 2
I2Async Bridge Functional Clock	MPU_CLK / 2

### 3.1.3.2 Reset Distribution

Resets to the MPU subsystem are provided by the PRCM and controlled by the clock generator module.

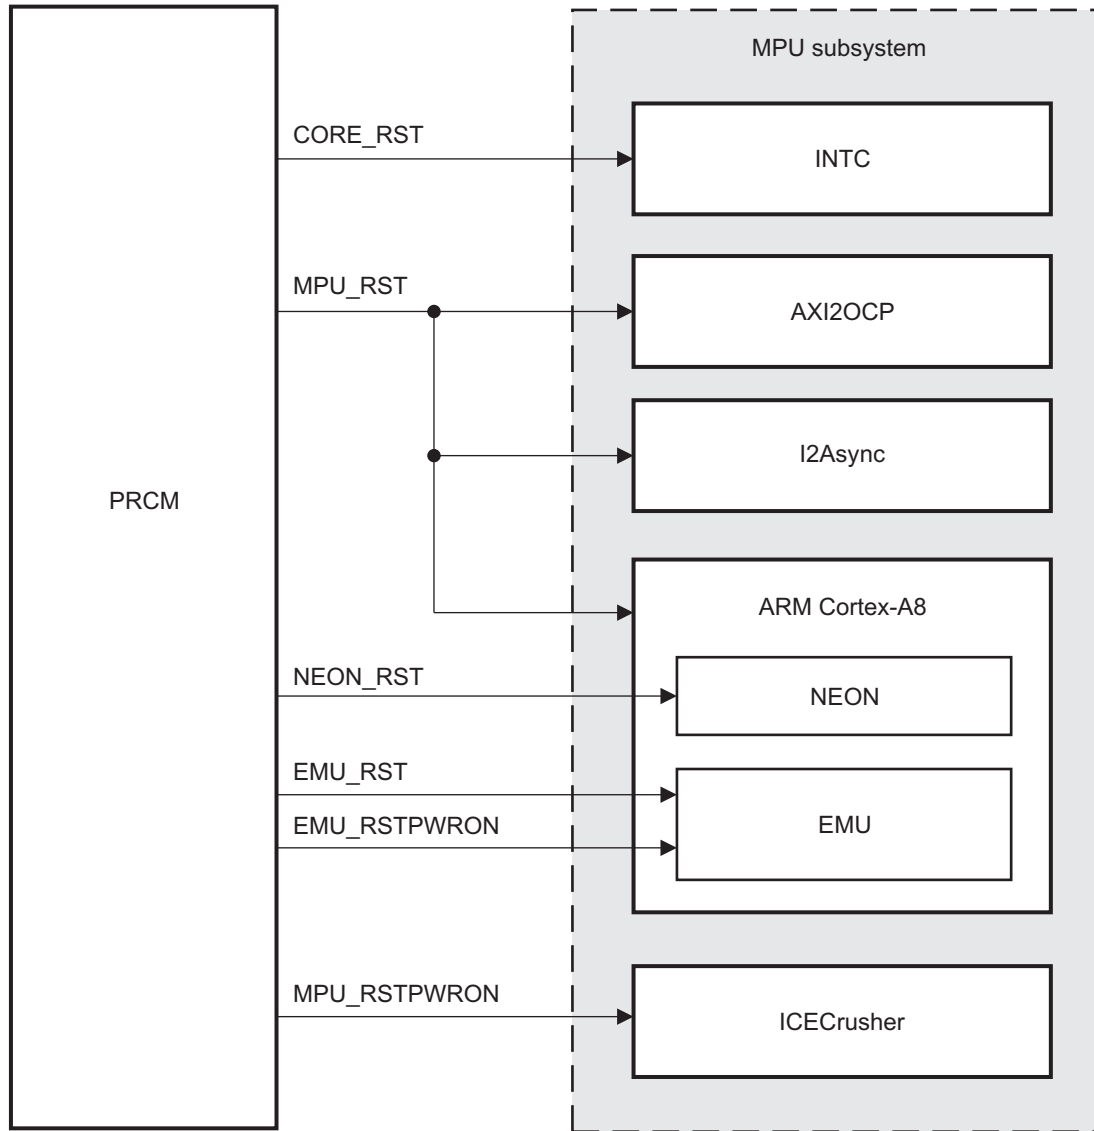

Figure 3-4. Reset Scheme of the MPU Subsystem

Table 3-2. Reset Scheme of the MPU Subsystem

Signal Name	I/O	Interface
MPU_RST	I	PRCM
NEON_RST	I	PRCM
CORE_RST	I	PRCM
MPU_RSTPWRON	I	PRCM
EMU_RST	I	PRCM
EMU_RSTPWRON	I	PRCM

For details about clocks, resets, and power domains, see [Chapter 8, Power, Reset, and Clock Management \(PRCM\)](#).

### 3.1.4 ARM Subchip

#### 3.1.4.1 ARM Overview

The ARM Cortex-A8 processor incorporates the technologies available in the ARM7™ architecture. These technologies include NEON™ for media and signal processing and Jazelle™ RCT for acceleration of realtime compilers, Thumb®-2 technology for code density and the VFPv3 floating point architecture.

#### 3.1.4.2 ARM Description

##### 3.1.4.2.1 ARM® Cortex™-A8 Instruction, Data, and Private Peripheral Port

The AXI bus interface is the main interface to the ARM system bus. It performs L2 cache fills and non-cacheable accesses for both instructions and data. The AXI interface supports 128bit and 64-bit wide input and output data buses. It supports multiple outstanding requests on the AXI bus and a wide range of bus clock to core clock ratios. The bus clock is synchronous with the core clock.

See the ARM® Cortex™-A8 Technical Reference Manual for a complete programming model of the transaction rules (ordering, posting, and pipeline synchronization) that are applied depending on the memory region attribute associated with the transaction destination address.

##### 3.1.4.2.2 Secure Monitor Calls to Access CP15 Registers

The device supports special secure monitor functions that allows access to certain ARM core registers in privileged mode. Functions to write to the Auxiliary Control Register, Nonsecure Access Control Register, and the L2 Cache Auxiliary Control Register are provided (see the ARM Technical Reference Manual for a description of these registers).

Service ID (R12)	Description
0x100	Write value in R0 to Auxiliary Control Register
0x101	Write value in R0 to Non Secure Access Control Register
0x102	Write value in R0 to L2 Cache Auxiliary Control Register

In general, the procedure to use these secure monitor call is as follows:

- Write the appropriate service ID to R12 .
- Load R0 with the value to write to the ARM core register.
- Perform barrier operations to ensure proper execution.
- Use SMC #1 (or SMI #1) to make the secure monitor call

Barrier instructions are also necessary to ensure a clean state before entering the secure monitor. Refer to the following example which provides the proper code sequence. This code provides an example of enabling ECC on L2 cache. Note: This function should be executed in an ARM privileged mode.

```

_enableL2ECC:
    STMFDP sp!, {r0 - r4}          ; save context of R0-R4, which secure monitor call may use
    MRC p15, #1, r0, c9, c0, #2    ; Read L2 Cache Auxiliary Control Reg into R0
    MOV r1, #0                    ; Clear R1
    MOVT r1, #0x1020              ; enable mask for ECC (set bits 21 and 28 to enable ECC)
    ORR r0, r0, r1                ; OR with original register value
    MOV r12, #0x0102              ; setup service ID in R12
    MCR p15, #0x0, r1, c7, c5, #6  ; invalidate entire branch predictor array
    DSB                          ; data synchronization barrier operation
    ISB                          ; instruction synchronization barrier operation
    DMB                          ; data memory barrier operation
    SMC #1                        ; secure monitor call SMC (previously SMI)
    LDMFDP sp!, {r0 - r4}         ; after returning from SMC, restore R0-R4
    MOV pc, lr                    ; return
  
```

### 3.1.4.2.3 ARM Core Supported Features

Table 3-3 provides a list of main functions of the Cortex™-A8 core supported inside the MPU Subsystem.

**Table 3-3. ARM Core Supported Features**

Features	Comments
ARM version 7 ISA	Standard ARM instruction set + Thumb2™, JazelleX™ Java accelerator, and Media extensions. Backward compatible with previous ARM ISA versions.
L1 Icache and Dcache	32 KB , 4-way, 16 word line, 128 bit interface.
L2 Cache	256 KB, 8-way, 16 word line, 128 bit interface to L1, ECC/Parity is supported. The L2 cache and cache controller are embedded within the ARM core. L2 valid bits cleared by software loop or by hardware.
TLB	Fully associative and separate ITLB with 32 entries and DTLB with 32 entries.
CoreSight ETM	The CoreSight ETM is embedded with the ARM core. The 32KB buffer (ETB) exists at the Chip Level (DebugSS)
Branch Target Address Cache	512 entries
Enhanced Memory Management Unit	Mapping sizes are 4KB, 64KB, 1MB, and 16MB. (ARM MMU adds extended physical address ranges)
Neon	Gives greatly enhanced throughput for media workloads and VFP-Lite support.
Flat Memories	176 Kbytes of ROM 64 Kbytes of RAM
Buses	128 bit AXI internal bus from CortexA8 routed by an AXI2OCP bridge to the interrupt controller, ROM, RAM, and 3 asynchronous OCP bridges (128 bits, and 64 bits)
Low interrupt latency	Closely coupled INTC to the ARM core with 128 interrupt lines
Vectored Interrupt Controller Port	Present.
JTAG based debug	Supported via DAP
Trace support	Supported via TPIU
External Coprocessor	Not supported

### 3.1.5 Interrupt Controller

The Host ARM Interrupt Controller (AINTC) is responsible for prioritizing all service requests from the system peripherals and generating either nIRQ or nFIQ to the host. The type of the interrupt (nIRQ or nFIQ) and the priority of the interrupt inputs are programmable. The AINTC interfaces to the ARM processor via the AXI port through an AXI2OCP bridge and runs at half the processor speed. It has the capability to handle up to 128 requests which can be steered/prioritized as A8 nFIQ or nIRQ interrupt requests.

The general features of the AINTC are:

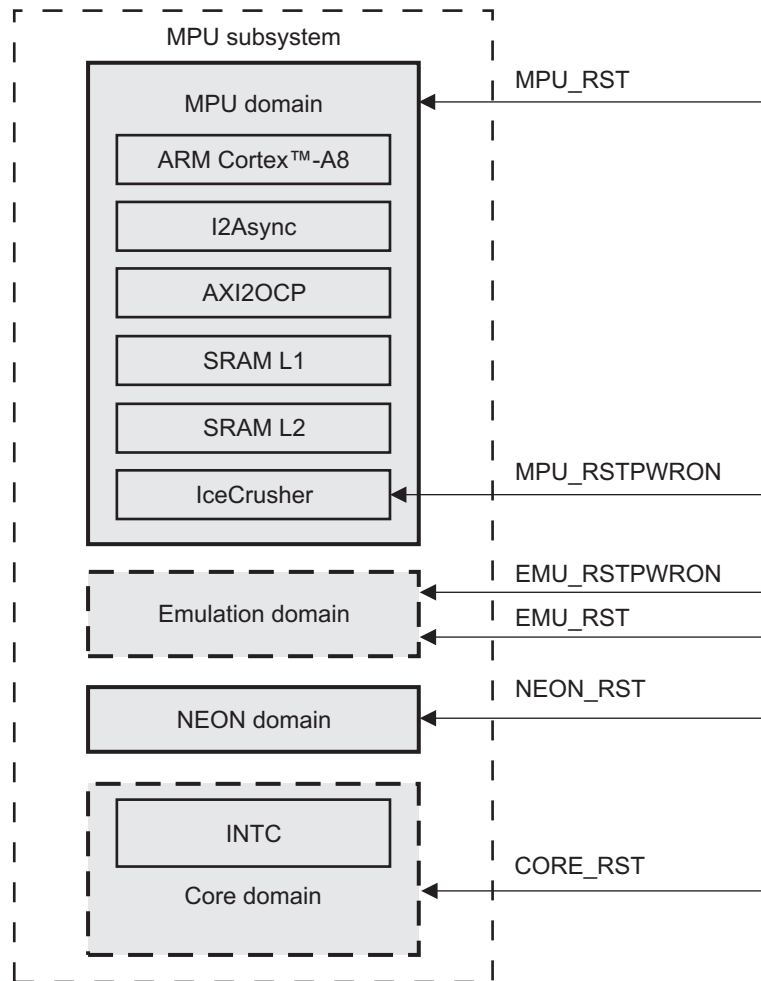

- Up to 128 level sensitive interrupts inputs
- Individual priority for each interrupt input
- Each interrupt can be steered to nFIQ or nIRQ
- Independent priority sorting for nFIQ and nIRQ

### 3.1.6 Power Management

#### 3.1.6.1 Power Domains

The MPU subsystem is divided into 5 power domains controlled by the PRCM, as shown in Figure [Figure 3-5](#).

**NOTE:** The emulation domain and the core domain are not fully embedded in MPU subsystem.

**Figure 3-5. MPU Subsystem Power Domain Overview**

Power management requirements at the device level govern power domains for the MPU subsystem. The device-level power domains are directly aligned with voltage domains and thus can be represented as a cross reference to the different voltage domains.

Table 3-4 shows the different power domains of the MPU subsystem and the modules inside.

**Table 3-4. Overview of the MPU Subsystem Power Domain**

Functional Power Domain	Physical Power Domain per System/Module
MPU subsystem domain	ARM, AXI2OCP, I2Asynch Bridge, ARM L1 and L2 periphery logic and array, ICE-Crusher, ETM, APB modules
MPU NEON domain	ARM NEON accelerator
CORE domain	MPU interrupt controller
EMU domain	EMU (ETB,DAP)

---

**NOTE:** L1 and L2 array memories have separate control signals into the in MPU Subsystem, thus directly controlled by PRCM For details on the physical power domains and the voltage domains, see [Chapter 8, Power, Reset, and Clock Management \(PRCM\)](#).

---

### 3.1.6.2 Power States

Each power domain can be driven by the PRCM in 3 different states, depending on the functional mode required by the user.

For each power domain the PRCM manages all transitions by controlling domain clocks, domain resets, domain logic power switches and memory power switches.

**Table 3-5. MPU Power States**

Power State	Logic Power	Memory Power	Clocks
Active	On	On or Off	On (at least one clock)
Inactive	On	On or Off	Off
Off	Off	Off	Off (all clocks)

### 3.1.6.3 Power Modes

The major part of the MPU subsystem belongs to the MPU power domain. The modules inside this power domain can be off at a time when the ARM processor is in an OFF or standby mode. IDLE/WAKEUP control is managed by the clock generator block but initiated by the PRCM module.

The MPU Standby status can be checked with PRCM.CM\_IDLEST\_MPU[0] ST\_MPU bit. For the MPU to be on, the core (referred here as the device core) power must be on. Device power management does not allow INTC to go to OFF state when MPU domain is on (active or one of retention modes).

The NEON core has independent power off mode when not in use. Enabling and disabling of NEON can be controlled by software.

#### CAUTION

The MPU L1 cache memory does not support retention mode, and its array switch is controlled together with the MPU logic. For compliance, the L1 retention control signals exist at the PRCM boundary, but are not used. The ARM L2 can be put into retention independently of the other domains.

[Table 3-6](#) outlines the supported operational power modes. All other combinations are illegal. The ARM L2, NEON, and ETM/Debug can be powered up/down independently. The APB/ATB ETM/Debug column refers to all three features: ARM emulation, trace, and debug.

The MPU subsystem must be in a power mode where the MPU power domain, NEON power domain, debug power domain, and INTC power domain are in standby, or off state.

**Table 3-6. MPU Subsystem Operation Power Modes**

Mode	MPU and ARM Core Logic	ARM L2 RAM	NEON INTC	Device Core and ETM	APB/ATB Debug
1	Active	Active	Active	Active	Disabled or enabled
2	Active	Active	OFF	Active	Disabled or enabled
3	Active	RET	Active	Active	Disabled or enabled
4	Active	RET	OFF	Active	Disabled or enabled
5	Active	OFF	Active	Active	Disabled or enabled
6	Active	OFF	OFF	Active	Disabled or enabled
7	OFF	RET	OFF	OFF	Disabled or enabled
8	Standby	Active	Standby	Active	Disabled or enabled
9	Standby	Active	OFF	Active	Disabled or enabled
10	Standby	RET	Standby	Active	Disabled or enabled
11	Standby	RET	OFF	Active	Disabled or enabled
12	Standby	OFF	Standby	Active	Disabled or enabled
13	Standby	OFF	OFF	Active	Disabled or enabled
14	OFF	OFF	OFF	OFF	Disabled or enabled

### 3.1.7 ARM Programming Model

For detailed descriptions of registers used for MPU configuration, see [Chapter 8, Power, Reset, and Clock Management \(PRCM\)](#).

#### 3.1.7.1 Clock Control

For clock configuration settings, see [Chapter 8, Power, Reset, and Clock Management \(PRCM\)](#).

#### 3.1.7.2 MPU Power Mode Transitions

The following subsections describe transitions of different power modes for MPU power domain:

- Basic power on reset
- MPU into standby mode
- MPU out of standby mode
- MPU power on from a powered off state

##### 3.1.7.2.1 Basic Power-On Reset

The power-on reset follows the following sequence of operation and is applicable to initial power-up and wakeup from device off mode:

Reset the INTC (CORE\_RST) and the MPU subsystem modules (MPU\_RST). The clocks must be active during the MPU reset and CORE reset.

##### 3.1.7.2.2 MPU Into Standby Mode

The MPU into standby mode follows the following sequence of operation and is applicable to initial power-up and wakeup from device Off mode.

1. The ARM core initiates entering into standby via software only (CP15 - WFI).
2. MPU modules requested internally of MPU subsystem to enter idle, after ARM core standby detected.
3. MPU is in standby output asserted for PRCM (all outputs guaranteed to be at reset values).
4. PRCM can now request INTC to enter into idle mode. Acknowledge from INTC goes to PRCM.

---

**NOTE:** The INTC SWAKEUP output is a pure hardware signal to PRCM for the status of its IDLE request and IDLE acknowledge handshake.

---

---

**NOTE:** In debug mode, ICE-Crusher could prevent MPU subsystem from entering into IDLE mode.

---

#### **3.1.7.2.3 MPU Out Of Standby Mode**

The MPU out of standby mode follows the following sequence of operation and is applicable to initial power-up and wakeup from device Off mode.

1. PRCM must start clocks through DPLL programming.
2. Detect active clocking via status output of DPLL.
3. Initiate an interrupt through the INTC to wake up the ARM core from STANDBYWFI mode.

#### **3.1.7.2.4 MPU Power On From a Powered-Off State**

1. MPU Power On, NEON Power On, Core Power On (INTC) should follow the ordered sequence per power switch daisy chain to minimize the peaking of current during power-up.

---

**NOTE:** The core domain must be on, and reset, before the MPU can be reset.

---

2. Follow the reset sequence as described in the Basic Power-On Reset section.

## ***Programmable Real-Time Unit and Industrial Communication Subsystem (PRU-ICSS)***

---

---

---

This chapter describes the PRU-ICSS for the device.

Topic	Page
<b>4.1 Introduction .....</b>	<b>177</b>

## 4.1 Introduction

The Programmable Real-Time Unit and Industrial Communication Subsystem (PRU-ICSS) consists of dual 32-bit RISC cores (Programmable Real-Time Units, or PRUs), memories, interrupt controller, and internal peripherals that enable additional peripheral interfaces and protocols.

The subsystem available on this device is the next-generation PRU (PRUSSv2) compared to the AM1x and OMAP-L13x.

Among the interfaces supported by the PRU-ICSS are the real-time industrial protocols used in master and slave mode, such as:

- EtherCAT®
- PROFINET
- EtherNet/IP™
- PROFIBUS
- POWERLINK
- SERCOS III

---

**NOTE:** For the availability of EtherCAT in the AM335x family of devices, see [Table 1-1, Device Features](#).

## Graphics Accelerator (SGX)

---

---

This chapter describes the graphics accelerator for the device.

Topic	Page
<b>5.1 Introduction</b> .....	<b>179</b>
<b>5.2 Integration</b> .....	<b>182</b>
<b>5.3 Functional Description</b> .....	<b>184</b>

## 5.1 Introduction

This chapter describes the 2D/3D graphics accelerator (SGX) for the device.

---

**NOTE:** The SGX subsystem is a Texas Instruments instantiation of the POWERVR® SGX530 core from Imagination Technologies Ltd.

This document contains materials that are ©2003-2007 Imagination Technologies Ltd.

POWERVR® and USSE™ are trademarks or registered trademarks of Imagination Technologies Ltd.

---

The 2D/3D graphics accelerator (SGX) subsystem accelerates 2-dimensional (2D) and 3-dimensional (3D) graphics applications. The SGX subsystem is based on the POWERVR® SGX core from Imagination Technologies. SGX is a new generation of programmable POWERVR graphic cores. The POWERVR SGX530 v1.2.5 architecture is scalable and can target all market segments from mainstream mobile devices to high-end desktop graphics. Targeted applications include feature phone, PDA, and hand-held games.

### 5.1.1 POWERVR SGX Main Features

- 2D graphics, 3D graphics, vector graphics, and programming support for GP-GPU functions
- Tile-based architecture
- Universal scalable shader engine ( USSE™) – multithreaded engine incorporating pixel and vertex shader functionality
- Advanced shader feature set – in excess of Microsoft VS3.0, PS3.0, and OpenGL2.0
- Industry-standard API support – Direct3D Mobile, OpenGL ES 1.1 and 2.0, OpenVG v1.0.1
- Fine-grained task switching, load balancing, and power management
- Advanced geometry direct memory access (DMA) driven operation for minimum CPU interaction
- Programmable high-quality image anti-aliasing
- POWERVR SGX core MMU for address translation from the core virtual address to the external physical address (up to 4GB address range)
- Fully virtualized memory addressing for OS operation in a unified memory architecture
- Advanced and standard 2D operations [e.g., vector graphics, BLTs (block level transfers), ROPs (raster operations)]
- 32K stride support

### 5.1.2 SGX 3D Features

- Deferred pixel shading
- On-chip tile floating point depth buffer
- 8-bit stencil with on-chip tile stencil buffer
- 8 parallel depth/stencil tests per clock
- Scissor test
- Texture support:
  - Cube map
  - Projected textures
  - 2D textures
  - Nonsquare textures
- Texture formats:
  - RGBA 8888, 565, 1555
  - Monochromatic 8, 16, 16f, 32f, 32int
  - Dual channel, 8:8, 16:16, 16f:16f

- Compressed textures PVR-TC1, PVR-TC2, ETC1
- Programmable support for all YUV formats
- Resolution support:
  - Frame buffer maximum size = 2048 x 2048
  - Texture maximum size = 2048 x 2048
- Texture filtering:
  - Bilinear, trilinear, anisotropic
  - Independent minimum and maximum control
- Antialiasing:
  - 4x multisampling
  - Up to 16x full scene anti-aliasing
  - Programmable sample positions
- Indexed primitive list support
  - Bus mastered
- Programmable vertex DMA
- Render to texture:
  - Including twiddled formats
  - Auto MipMap generation
- Multiple on-chip render targets (MRT).
 

**Note:** Performance is limited when the on-chip memory is not available.

### 5.1.3 Universal Scalable Shader Engine (USSE) – Key Features

The USSE is the engine core of the POWERVR SGX architecture and supports a broad range of instructions.

- Single programming model:
  - Multithreaded with 16 simultaneous execution threads and up to 64 simultaneous data instances
  - Zero-cost swapping in, and out, of threads
  - Cached program execution model
  - Dedicated pixel processing instructions
  - Dedicated video encode/decode instructions
- SIMD execution unit supporting operations in:
  - 32-bit IEEE float
  - 2-way 16-bit fixed point
  - 4-way 8-bit integer
  - 32-bit bit-wise (logical only)
- Static and dynamic flow control:
  - Subroutine calls
  - Loops
  - Conditional branches
  - Zero-cost instruction predication
- Procedural geometry:
  - Allows generation of primitives
  - Effective geometry compression
  - High-order surface support
- External data access:
  - Permits reads from main memory using cache

- Permits writes to main memory
- Data fence facility
- Dependent texture reads

#### **5.1.4 *Unsupported Features***

There are no unsupported SGX530 features for this device.

## 5.2 Integration

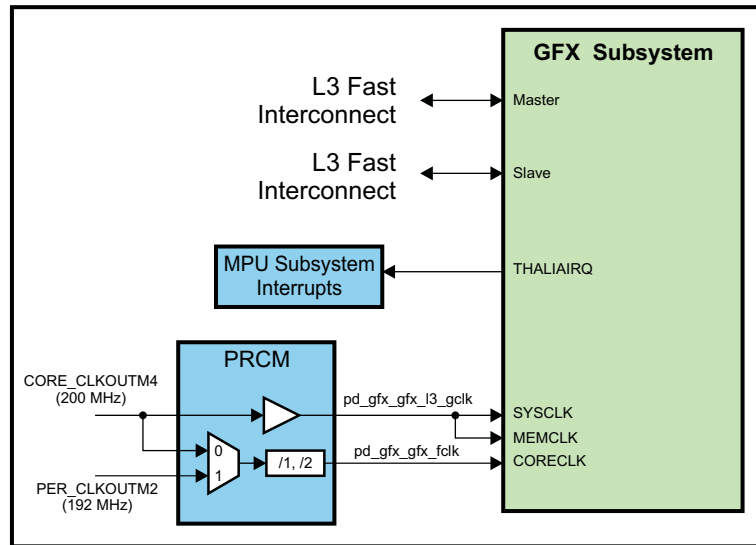

Figure 5-1. SGX530 Integration

### 5.2.1 SGX530 Connectivity Attributes

The general connectivity attributes of the SGX530 are shown in the following table.

Table 5-1. SGX530 Connectivity Attributes

Attributes	Type
Power domain	GFX Domain
Clock domain	SGX_CLK
Reset signals	SGX_RST
Idle/Wakeup signals	Smart Idle Initiator Standby
Interrupt request	THALIAIRQ (GFXINT) to MPU Subsystem
DMA request	None
Physical address	L3 Fast slave port

### 5.2.2 SGX530 Clock and Reset Management

The SGX530 uses separate functional and interface clocks. The SYSCLK is the clock for the slave interface and runs at the L3F frequency. The MEMCLK is the clock for the memories and master interface and also runs at the L3F frequency. The CORECLK is the functional clock. It can be sourced from either the L3F clock (CORE\_CLKOUTM4) or from the 192 MHz PER\_CLKOUTM2 and can optionally be divided by 2.

Table 5-2. SGX530 Clock Signals

Clock signal	Max Freq	Reference / Source	Comments
SYSCLK Interface clock	200 MHz	CORE_CLKOUTM4	pd_gfx_gfx_l3_gclk From PRCM
MEMCLK Memory Clock	200 MHz	CORE_CLKOUTM4	pd_gfx_gfx_l3_gclk From PRCM
CORECLK Functional clock	200 MHz	PER_CLKOUTM2 or CORE_CLKOUTM4	pd_gfx_gfx_fclk From PRCM

### **5.2.3 SGX530 Pin List**

The SGX530 module does not include any external interface pins.

### 5.3 Functional Description

#### 5.3.1 SGX Block Diagram

The SGX subsystem is based on the POWERVR® SGX530 core from Imagination Technologies. The architecture uses programmable and hard coded pipelines to perform various processing tasks required in 2D, 3D, and video processing. The SGX architecture comprises the following elements:

- Coarse grain scheduler
  - Programmable data sequencer (PDS)
  - Data master selector (DMS)
- Vertex data master (VDM)
- Pixel data master (PDM)
- General-purpose data master
- USSE
- Tiling coprocessor
- Pixel coprocessor
- Texturing coprocessor
- Multilevel cache

Figure 5-2 shows a block diagram of the SGX cores.

**Figure 5-2. SGX Block Diagram**

#### 5.3.2 SGX Elements Description

The coarse grain scheduler (CGS) is the main system controller for the POWERVR SGX architecture. It consists of two stages, the DMS and the PDS. The DMS processes requests from the data masters and determines which tasks can be executed given the resource requirements. The PDS then controls the loading and processing of data on the USSE.

There are three data masters in the SGX core:

- The VDM is the initiator of transform and lighting processing within the system. The VDM reads an

input control stream, which contains triangle index data and state data. The state data indicates the PDS program, size of the vertices, and the amount of USSE output buffer resource available to the VDM. The triangle data is parsed to determine unique indices that must be processed by the USSE. These are grouped together according to the configuration provided by the driver and presented to the DMS.

- The PDM is the initiator of rasterization processing within the system. Each pixel pipeline processes pixels for a different half of a given tile, which allows for optimum efficiency within each pipe due to locality of data. It determines the amount of resource required within the USSE for each task. It merges this with the state address and issues a request to the DMS for execution on the USSE.
- The general-purpose data master responds to events within the system (such as end of a pass of triangles from the ISP, end of a tile from the ISP, end of render, or parameter stream breakpoint event). Each event causes either an interrupt to the host or synchronized execution of a program on the PDS. The program may, or may not cause a subsequent task to be executed on the USSE.

The USSE is a user-programmable processing unit. Although general in nature, its instructions and features are optimized for three types of task: processing vertices (vertex shading), processing pixels (pixel shading), and video/imaging processing.

The multilevel cache is a 2-level cache consisting of two modules: the main cache and the mux/arbitrator/demux/decompression unit (MADD). The MADD is a wrapper around the main cache module designed to manage and format requests to and from the cache, as well as providing Level 0 caching for texture and USSE requests. The MADD can accept requests from the PDS, USSE, and texture address generator modules. Arbitration, as well as any required texture decompression, are performed between the three data streams.

The texturing coprocessor performs texture address generation and formatting of texture data. It receives requests from either the iterators or USSE modules and translates these into requests in the multilevel cache. Data returned from the cache are then formatted according to the texture format selected, and sent to the USSE for pixel-shading operations.

To process pixels in a tiled manner, the screen is divided into tiles and arranged as groups of tiles by the tiling coprocessor. An inherent advantage of tiling architecture is that a large amount of vertex data can be rejected at this stage, thus reducing the memory storage requirements and the amount of pixel processing to be performed.

The pixel coprocessor is the final stage of the pixel-processing pipeline and controls the format of the final pixel data sent to the memory. It supplies the USSE with an address into the output buffer and then USSE returns the relevant pixel data. The address order is determined by the frame buffer mode. The pixel coprocessor contains a dithering and packing function.

## Interrupts

---

---

---

This section describes the interrupts for the device.

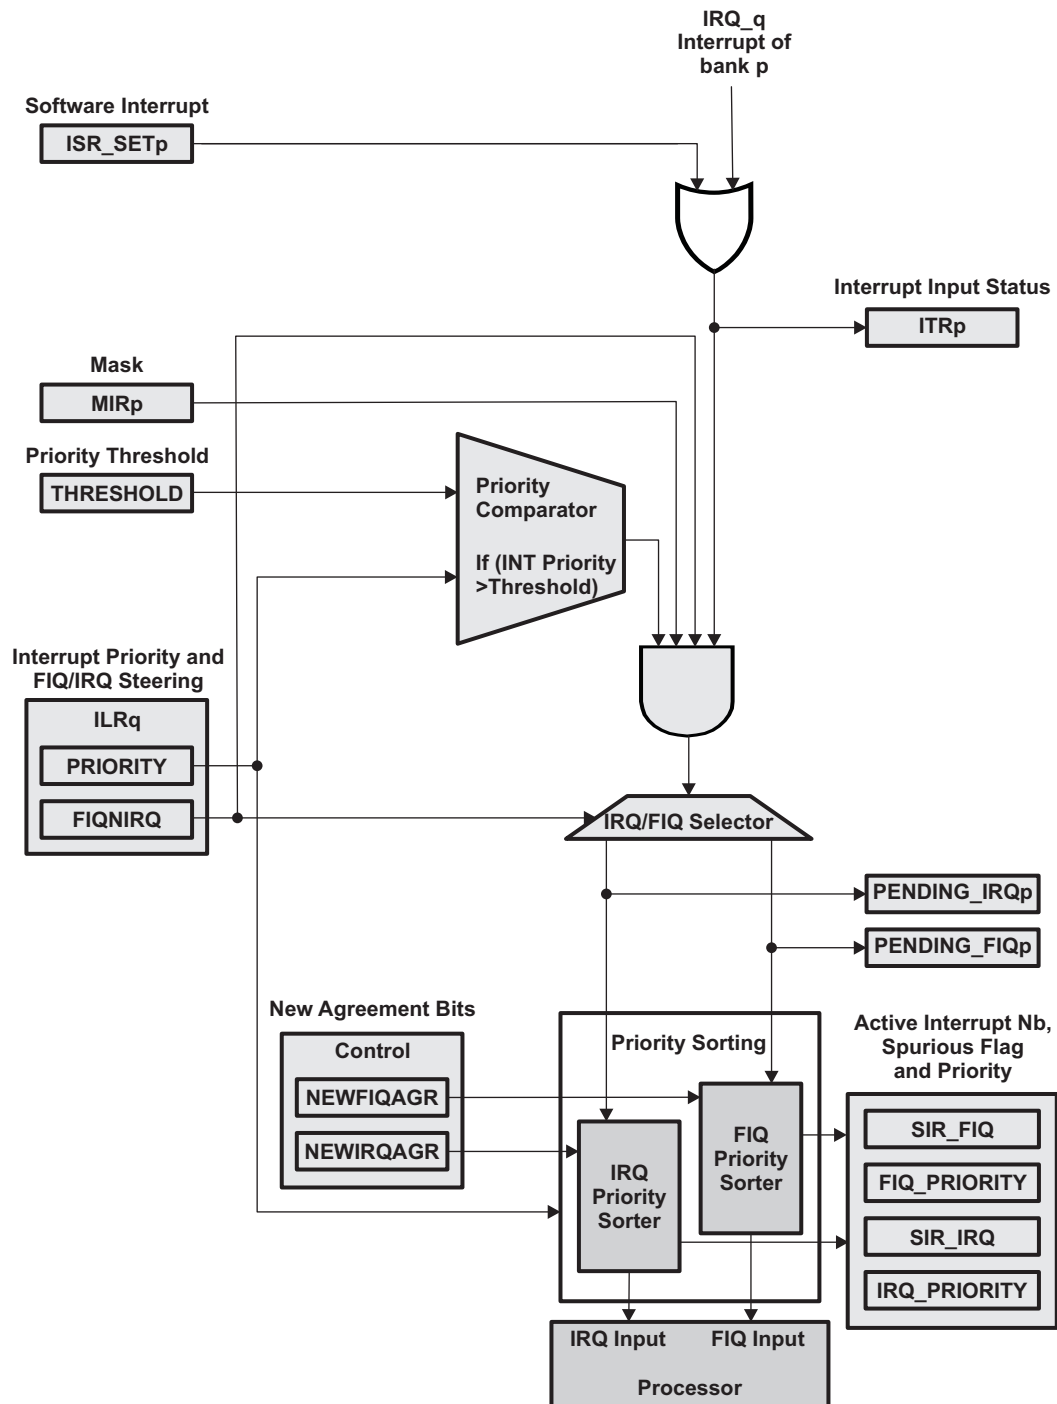

Topic	Page
<b>6.1 Functional Description .....</b>	<b>187</b>
<b>6.2 Basic Programming Model .....</b>	<b>190</b>
<b>6.3 ARM Cortex-A8 Interrupts .....</b>	<b>199</b>
<b>6.4 PWM Events .....</b>	<b>203</b>
<b>6.5 Interrupt Controller Registers .....</b>	<b>204</b>

## 6.1 Functional Description

The interrupt controller processes incoming interrupts by masking and priority sorting to produce the interrupt signals for the processor to which it is attached. Figure 6-1 shows the top-level view of interrupt processing.

**NOTE:** FIQ is not available on general-purpose (GP) devices.

Figure 6-1. Interrupt Controller Block Diagram

## 6.1.1 Interrupt Processing

### 6.1.1.1 Input Selection

The INTC supports only level-sensitive incoming interrupt detection. A peripheral asserting an interrupt maintains it until software has handled the interrupt and instructed the peripheral to deassert the interrupt. A software interrupt is generated if the corresponding bit in the MPU\_INTC.INTC\_ISR\_SETn register is set (register bank number: n = [0,1,2,3] for the MPU subsystem INTC, 128 incoming interrupt lines are supported). The software interrupt clears when the corresponding bit in the MPU\_INTC.INTC\_ISR\_CLEARn register is written. Typical use of this feature is software debugging.

### 6.1.1.2 Masking

#### 6.1.1.2.1 Individual Masking

Detection of interrupts on each incoming interrupt line can be enabled or disabled independently by the MPU\_INTC.INTC\_MIRn interrupt mask register. In response to an unmasked incoming interrupt, the INTC can generate one of two types of interrupt requests to the processor:

- IRQ: low-priority interrupt request
- FIQ: fast interrupt request (Not available on General Purpose (GP) devices)

The type of interrupt request is determined by the MPU\_INTC.INTC\_ILRm[0] FIQNIRQ bit (m= [0,127]). The current incoming interrupt status before masking is readable from the MPU\_INTC.INTC\_ITRn register. After masking and IRQ/FIQ selection, and before priority sorting is done, the interrupt status is readable from the MPU\_INTC.INTC\_PENDING\_IRQn and MPU\_INTC.INTC\_PENDING\_FIQn registers.

#### 6.1.1.2.2 Priority Masking

To enable faster processing of high-priority interrupts, a programmable priority masking threshold is provided (the MPU\_INTC.INTC\_THRESHOLD[7:0] PRIORITYTHRESHOLD field). This priority threshold allows preemption by higher priority interrupts; all interrupts of lower or equal priority than the threshold are masked. However, priority 0 can never be masked by this threshold; a priority threshold of 0 is treated the same way as priority 1. PRIORITY and PRIORITYTHRESHOLD fields values can be set between 0x0 and 0x7F; 0x0 is the highest priority and 0x7F is the lowest priority. When priority masking is not necessary, a priority threshold value of 0xFF disables the priority threshold mechanism. This value is also the reset default for backward compatibility with previous versions of the INTC.

### 6.1.1.3 Priority Sorting

A priority level (0 being the highest) is assigned to each incoming interrupt line. Both the priority level and the interrupt request type are configured by the MPU\_INTC.INTC\_ILRm register. If more than one incoming interrupt with the same priority level and interrupt request type occur simultaneously, the highest-numbered interrupt is serviced first. When one or more unmasked incoming interrupts are detected, the INTC separates between IRQ and FIQ using the corresponding MPU\_INTC.INTC\_ILRm[0] FIQNIRQ bit.

The result is placed in INTC\_PENDING\_IRQn or INTC\_PENDING\_FIQn. If no other interrupts are currently being processed, INTC asserts IRQ/FIQ and starts the priority computation. Priority sorting for IRQ and FIQ can execute in parallel. Each IRQ/FIQ priority sorter determines the highest priority interrupt number. Each priority number is placed in the corresponding MPU\_INTC.INTC\_SIR\_IRQ[6:0] ACTIVEIRQ field or MPU\_INTC.INTC\_SIR\_FIQ[6:0] ACTIVEFIQ field. The value is preserved until the corresponding MPU\_INTC.INTC\_CONTROL\_NEWIRQAGR or NEWFIQAGR bit is set. Once the interrupting peripheral device has been serviced and the incoming interrupt deasserted, the user must write to the appropriate NEWIRQAGR or NEWFIQAGR bit to indicate to the INTC the interrupt has been handled. If there are any pending unmasked incoming interrupts for this interrupt request type, the INTC restarts the appropriate priority sorter; otherwise, the IRQ or FIQ interrupt line is deasserted.

### 6.1.2 Register Protection

If the MPU\_INTC.INTC\_PROTECTION[0] PROTECTION bit is set, access to the INTC registers is restricted to the supervisor mode. Access to the MPU\_INTC.INTC\_PROTECTION register is always restricted to privileged mode. For more information, see [Section 6.5.1.7, INTC\\_PROTECTION Register \(offset = 4Ch\) \[reset = 0h\]](#).

### 6.1.3 Module Power Saving

The INTC provides an auto-idle function in its three clock domains:

- Interface clock
- Functional clock
- Synchronizer clock

The interface clock auto-idle power-saving mode is enabled if the MPU\_INTC.INTC\_SYSCONFIG[0] AUTOIDLE bit is set to 1. When this mode is enabled and there is no activity on the bus interface, the interface clock is disabled internally to the module, thus reducing power consumption. When there is new activity on the bus interface, the interface clock restarts without any latency penalty. After reset, this mode is disabled, by default. The functional clock auto-idle power-saving mode is enabled if the MPU\_INTC.INTC\_IDLE[0] FUNCIDLE bit is set to 0. When this mode is enabled and there is no active interrupt (IRQ or FIQ interrupt being processed or generated) or no pending incoming interrupt, the functional clock is disabled internally to the module, thus reducing power consumption.

When a new unmasked incoming interrupt is detected, the functional clock restarts and the INTC processes the interrupt. If this mode is disabled, the interrupt latency is reduced by one cycle. After reset, this mode is enabled, by default. The synchronizer clock allows external asynchronous interrupts to be resynchronized before they are masked. The synchronizer input clock has an auto-idle power-saving mode enabled if the MPU\_INTC.INTC\_IDLE[1] TURBO bit is set to 1. If the auto-idle mode is enabled, the standby power is reduced, but the IRQ or FIQ interrupt latency increases from four to six functional clock cycles. This feature can be enabled dynamically according to the requirements of the device. After reset, this mode is disabled, by default.

### 6.1.4 Error Handling

The following accesses will cause an error:

- Privilege violation (attempt to access PROTECTION register in user mode or any register in user mode if Protection bit is set)
- Unsupported commands

The following accesses will not cause any error response:

- Access to a non-decoded address
- Write to a read-only register

### 6.1.5 Interrupt Handling

The IRQ/FIQ interrupt generation takes four INTC functional clock cycles (plus or minus one cycle) if the MPU\_INTC.INTC\_IDLE[1] TURBO bit is set to 0. If the TURBO bit is set to 1, the interrupt generation takes six cycles, but power consumption is reduced while waiting for an interrupt. These latencies can be reduced by one cycle by disabling functional clock auto-idle (MPU\_INTC.INTC\_IDLE[0] FUNCIDLE bit set to 1), but power consumption is increased, so the benefit is minimal.

To minimize interrupt latency when an unmasked interrupt occurs, the IRQ or FIQ interrupt is generated before priority sorting completion. The priority sorting takes 10 functional clock cycles, which is less than the minimum number of cycles required for the MPU to switch to the interrupt context after reception of the IRQ or FIQ event.

Any read of the MPU\_INTC.INTC\_SIR\_IRQ or MPU\_INTC.INTC\_SIR\_FIQ register during the priority sorting process stalls until priority sorting is complete and the relevant register is updated. However, the delay between the interrupt request being generated and the interrupt service routine being executed is such that priority sorting always completes before the MPU\_INTC.INTC\_SIR\_IRQ or MPU\_INTC.INTC\_SIR\_FIQ register is read.

## 6.2 Basic Programming Model

### 6.2.1 Initialization Sequence

1. Program the MPU\_INTC.INTC\_SYSCONFIG register: If necessary, enable the interface clock autogating by setting the AUTOIDLE bit.
2. Program the MPU\_INTC.INTC\_IDLE register: If necessary, disable functional clock autogating or enable synchronizer autogating by setting the FUNCIDLE bit or TURBO bit accordingly.
3. Program the MPU\_INTC.INTC\_ILRm register for each interrupt line: Assign a priority level and set the FIQNIRQ bit for an FIQ interrupt (by default, interrupts are mapped to IRQ and priority is 0x0 [highest]).
4. Program the MPU\_INTC.INTC\_MIRn register: Enable interrupts (by default, all interrupt lines are masked). NOTE: To program the MPU\_INTC.INTC\_MIRn register, the MPU\_INTC.INTC\_MIR\_SETn and MPU\_INTC.INTC\_MIR\_CLEARn registers are provided to facilitate the masking, even if it is possible for backward-compatibility to write directly to the MPU\_INTC.INTC\_MIRn register.

### 6.2.2 INTC Processing Sequence

After the INTC\_MIRn and INTC\_ILRm registers are configured to enable and assign priorities to incoming interrupts, the interrupt is processed as explained in the following subsections. IRQ and FIQ processing sequences are quite similar, the differences for the FIQ sequence are shown after a '/' character in the code below.

1. One or more unmasked incoming interrupts (M\_IRQ\_n signals) are received and IRQ or FIQ outputs (IRQ/FIQ) are not currently asserted.
2. If the INTC\_ILRm[0] FIQNIRQ bit is cleared to 0, the MPU\_INTC\_IRQ output signal is generated. If the FIQNIRQ bit is set to 1, the MPU\_INTC\_FIQ output signal is generated.
3. The INTC performs the priority sorting and updates the INTC\_SIR\_IRQ[6:0] ACTIVEIRQ /INTC\_SIR\_FIQ[6:0] ACTIVEFIQ field with the current interrupt number.
4. During priority sorting, if the IRQ/FIQ is enabled at the host processor side, the host processor automatically saves the current context and executes the ISR as follows.

The ARM host processor automatically performs the following actions in pseudo code:

```

LR = PC + 4                /* return link */
SPSR = CPSR               /* Save CPSR before execution */
CPSR[5] = 0               /* Execute in ARM state */
CPSR[7] = 1               /* Disable IRQ */
CPSR[8] = 1               /* Disable Imprecise Data Aborts */
CPSR[9] = CP15_reg1_EEbit /* Endianness on exception entry */
if interrupt == IRQ then
    CPSR[4:0] = 0b10010    /* Enter IRQ mode */
    if high vectors configured then
        PC = 0xFFFF0018
    else
        PC = 0x00000018    /* execute interrupt vector */
else if interrupt == FIQ then
    CPSR[4:0] = 0b10001    /* Enter FIQ mode */
    CPSR[6] = 1            /* Disable FIQ */
    if high vectors configured then
        PC = 0xFFFF001C
    else
        PC = 0x0000001C    /* execute interrupt vector */
endif
    
```

- The ISR saves the remaining context, identifies the interrupt source by reading the ACTIVEIRQ/ACTIVEFIQ field, and jumps to the relevant subroutine handler as follows:

### CAUTION

The code in steps 5 and 7 is an assembly code compatible with ARM architecture V6 and V7. This code is developed for the Texas Instruments Code Composer Studio tool set. It is a draft version, only tested on an emulated environment.

```

;INTC_SIR_IRQ/INTC_SIR_FIQ register address
INTC_SIR_IRQ_ADDR/INTC_SIR_FIQ_ADDR .word 0x48200040/0x48200044
; ACTIVEIRQ bit field mask to get only the bit field
ACTIVEIRQ_MASK .equ 0x7F
_IRQ_ISR/_FIQ_ISR:
; Save the critical context
STMFDP SP!, {R0-R12, LR} ; Save working registers and the Link register
MRS R11, SPSR ; Save the SPSR into R11
; Get the number of the highest priority active IRQ/FIQ
LDR R10, INTC_SIR_IRQ_ADDR/INTC_SIR_FIQ_ADDR
LDR R10, [R10] ; Get the INTC_SIR_IRQ/INTC_SIR_FIQ register
AND R10, R10, #ACTIVEIRQ_MASK ; Apply the mask to get the active IRQ number
; Jump to relevant subroutine handler
LDR PC, [PC, R10, lsl #2] ; PC base address points this instruction + 8
NOP ; To index the table by the PC
; Table of handler start addresses
.word IRQ0handler ;For IRQ0 of BANK0
.word IRQ1handler
.word IRQ2handler

```

- The subroutine handler executes code specific to the peripheral generating the interrupt by handling the event and deasserting the interrupt condition at the peripheral side.

```

; IRQ0 subroutine
IRQ0handler:
; Save working registers
STMFDP SP!, {R0-R1}
; Now read-modify-write the peripheral module status register
; to de-assert the M_IRQ_0 interrupt signal
; De-Assert the peripheral interrupt
MOV R0, #0x7 ; Mask for 3 flags
LDR R1, MODULE0_STATUS_REG_ADDR ; Get the address of the module Status Register
STR R0, [R1] ; Clear the 3 flags
; Restore working registers LDMFDP SP!, {R0-R1}
; Jump to the end part of the ISR
B IRQ_ISR_end/FIQ_ISR_end

```

7. After the return of the subroutine, the ISR sets the NEWIRQAGR/NEWFIQAGR bit to enable the processing of subsequent pending IRQs/FIQs and to restore ARM context in the following code. Because the writes are posted on an Interconnect bus, to be sure that the preceding writes are done before enabling IRQs/FIQs, a Data Synchronization Barrier is used. This operation ensure that the IRQ/FIQ line is de-asserted before IRQ/FIQ enabling. After that, the INTC processes any other pending interrupts or deasserts the IRQ/FIQ signal if there is no interrupt.

```

; INTC_CONTROL register address
INTC_CONTROL_ADDR .word 0x48200048;
NEWIRQAGR/NEWFIQAGR bit mask to set only the NEWIRQAGR/NEWFIQAGR bit
NEWIRQAGR_MASK/NEWFIQAGR_MASK .equ 0x01/0x02
IRQ_ISR_end/FIQ_ISR_end:
; Allow new IRQs/FIQs at INTC side
; The INTC_CONTROL register is a write only register so no need to write back others bits
MOV R0, #NEWIRQAGR_MASK/NEWFIQAGR_MASK ; Get the NEWIRQAGR/NEWFIQAGR bit position
LDR R1, INTC_CONTROL_ADDR
STR R0, [R1] ; Write the NEWIRQAGR/NEWFIQAGR bit to allow new IRQs/FIQ
; Data Synchronization Barrier MOV R0, #0
MCR P15, #0, R0, C7, C10, #4
; restore critical context
MSR SPSR, R11 ; Restore the SPSR from R11
LDMFD SP!, {R0-R12, LR} ; Restore working registers and Link register
; Return after handling the interrupt
SUBS PC, LR, #4
8. After the ISR return, the ARM automatically restores its context as follows:
CPSR = SPSR
PC = LR

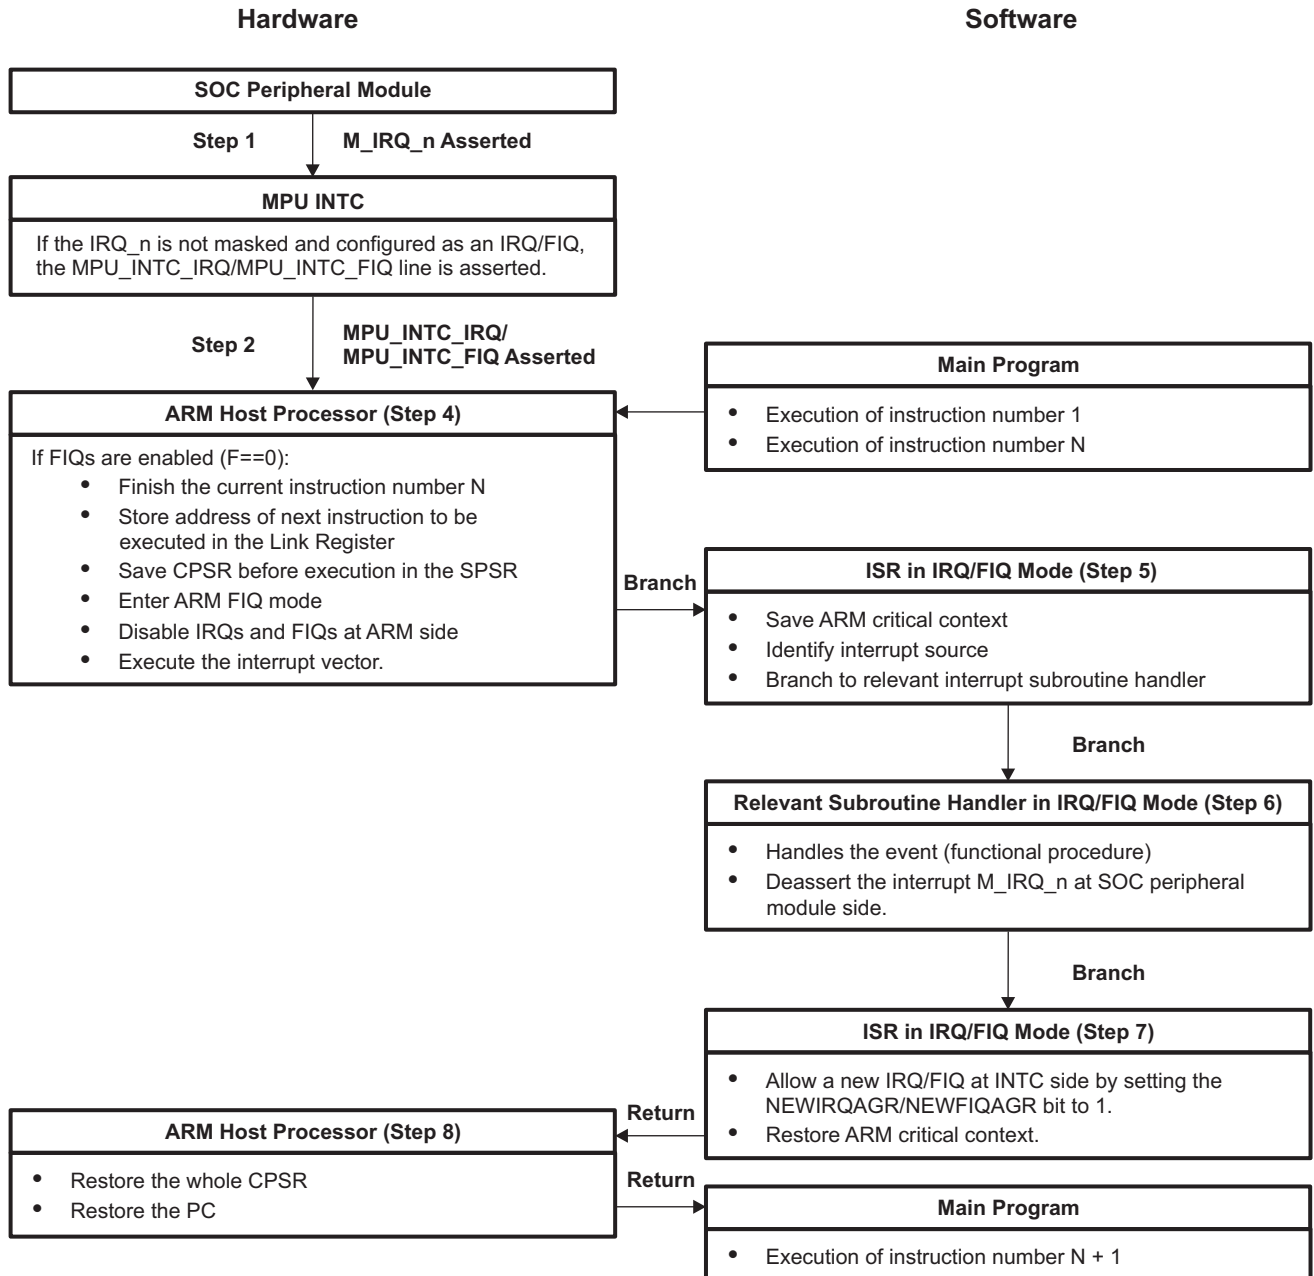

```

Figure 6-2 shows the IRQ/FIQ processing sequence from the originating device peripheral module to the main program interruption.

The priority sorting mechanism is frozen during an interrupt processing sequence. If an interrupt condition occurs during this time, the interrupt is not lost. It is sorted when the NEWIRQAGR/NEWFIQAGR bit is set (priority sorting is reactivated).

Figure 6-2. IRQ/FIQ Processing Sequence

### 6.2.3 INTC Preemptive Processing Sequence

Preemptive interrupts, also called nested interrupts, can reduce the latencies for higher priority interrupts. A preemptive ISR can be suspended by a higher priority interrupt. Thus, the higher priority interrupt can be served immediately. Nested interrupts must be used carefully to avoid using corrupted data. Programmers must save corruptible registers and enable IRQ or FIQ at ARM side. IRQ and FIQ processing sequences are quite similar, the differences for the FIQ sequence are shown after a '/' character in the code below.

To enable IRQ/FIQ preemption by higher priority IRQs/FIQs, programmers can follow this procedure to write the ISR.

At the beginning of an IRQ/FIQ ISR:

1. Save the ARM critical context registers.
2. Save the INTC\_THRESHOLD PRIORITYTHRESHOLD field before modifying it.
3. Read the active interrupt priority in the INTC\_IRQ\_PRIORITY IRQPRIORITY/INTC\_FIQ\_PRIORITY FIQPRIORITY field and write it to the PRIORITYTHRESHOLD(1) field.
4. Read the active interrupt number in the INTC\_SIR\_IRQ[6:0] ACTIVEIRQ/INTC\_SIR\_FIQ[6:0] ACTIVEFIQ field to identify the interrupt source.
5. Write 1 to the appropriate INTC\_CONTROL NEWIRQAGR and (2) NEWFIQAGR bit while an interrupt is still processing to allow only higher priority interrupts to preempt.
6. Because the writes are posted on an Interconnect bus, to be sure that the preceding writes are done before enabling IRQs/FIQs, a Data Synchronization Barrier is used. This operation ensure that the IRQ line is de-asserted before IRQ/FIQ enabling.
7. Enable IRQ/FIQ at ARM side.
8. Jump to the relevant subroutine handler.

The following sample code shows the previous steps:

### CAUTION

The following code is an assembly code compatible with ARM architecture V6 and V7. This code is developed for the Texas Instruments Code Composer Studio tool set. It is a draft version, only tested on an emulated environment.

```

; bit field mask to get only the bit field
ACTIVEPRIO_MASK .equ 0x7F
_IRQ_ISR:
; Step 1 : Save the critical context
STMFD SP!, {R0-R12, LR} ; Save working registers
MRS R11, SPSR ; Save the SPSR into R11
; Step 2 : Save the INTC_THRESHOLD register into R12
LDR R0, INTC_THRESHOLD_ADDR
LDR R12, [R0]
(1) The priority-
threshold mechanism is enabled automatically when writing a priority in the range of 0x00 to
0x7F. Writing a value of 0xFF (reset default) disables the priority-
threshold mechanism. Values between 0x3F and 0xFF must not be used. When the hardware-
priority threshold is in use, the priorities of interrupts selected as FIQ or IRQ become linked
otherwise, they are independent. When they are linked, all FIQ priorities must be set higher than
all IRQ priorities to maintain the relative priority of FIQ over IRQ.
(2) When handling FIQs using the priority-
threshold mechanism, both NEWFIQAGR and NEWIRQAGR bits must be written at the same time to ensure
that the new priority threshold is applied while an IRQ sort is in progress. This IRQ will not
have been seen by the ARM, as it will have been masked on entry to the FIQ ISR. However, the
source of the IRQ remains active and it is finally processed when the priority threshold falls to
a priority sufficiently low to allow it to be processed. The precaution of writing to New FIQ
Agreement is not required during an IRQ ISR, as FIQ sorting is not affected (provided all FIQ
priorities are higher than all IRQ priorities).
; Step 3 : Get the priority of the highest priority active IRQ
LDR R1, INTC_IRQ_PRIORITY_ADDR/INTC_FIQ_PRIORITY_ADDR
LDR R1, [R1] ; Get the INTC_IRQ_PRIORITY/INTC_FIQ_PRIORITY register
AND R1, R1, #ACTIVEPRIO_MASK ; Apply the mask to get the priority of the IRQ
STR R1, [R0] ; Write it to the INTC_THRESHOLD register
; Step 4 : Get the number of the highest priority active IRQ
LDR R10, INTC_SIR_IRQ_ADDR/INTC_SIR_FIQ_ADDR
LDR R10, [R10] ; Get the INTC_SIR_IRQ/INTC_SIR_FIQ register
AND R10, R10, #ACTIVEIRQ_MASK ; Apply the mask to get the active IRQ number
; Step 5 : Allow new IRQs and FIQs at INTC side
MOV R0, #0x1/0x3 ; Get the NEWIRQAGR and NEWFIQAGR bit position
LDR R1, INTC_CONTROL_ADDR
STR R0, [R1] ; Write the NEWIRQAGR and NEWFIQAGR bit
; Step 6 : Data Synchronization Barrier
MOV R0, #0 MCR P15, #0, R0, C7, C10, #4
; Step 7 : Read-modify-write the CPSR to enable IRQs/FIQs at ARM side
MRS R0, CPSR ; Read the status register
BIC R0, R0, #0x80/0x40 ; Clear the I/F bit
MSR CPSR, R0 ; Write it back to enable IRQs
; Step 8 : Jump to relevant subroutine handler
LDR PC, [PC, R10, lsl #2] ; PC base address points this instruction + 8
NOP ; To index the table by the PC
; Table of handler start addresses
.word IRQ0handler ;IRQ0 BANK0
.word IRQ1handler
.word IRQ2handler

```

After the return of the relevant IRQ/FIQ subroutine handle:

1. Disable IRQs/FIQs at ARM side.
2. Restore the INTC\_THRESHOLD PRIORITYTHRESHOLD field.
3. Restore the ARM critical context registers.

The following sample code shows the three previous steps:

**CAUTION**

The following code is an assembly code compatible with ARM architecture V6 and V7. This code is developed for the Texas Instruments Code Composer Studio tool set. It is a draft version, only tested on an emulated environment.

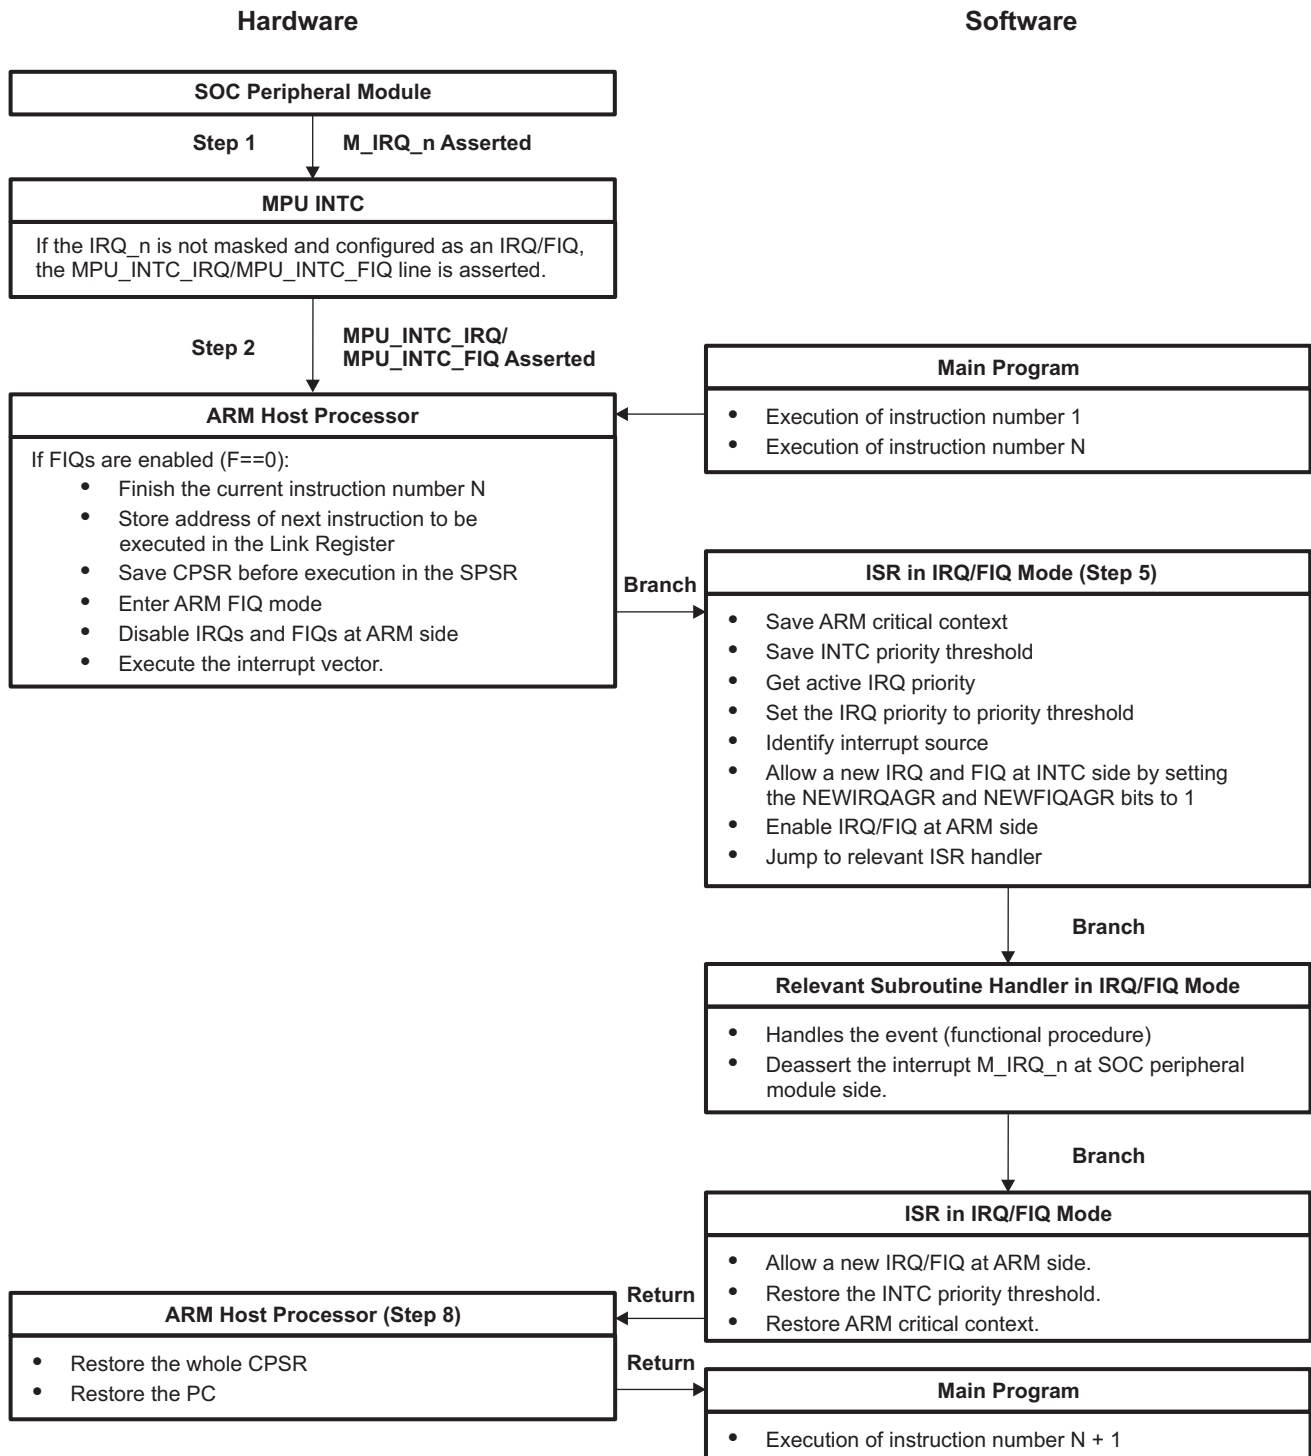

```

IRQ_ISR_end:
; Step 1 : Read-modify-write the CPSR to disable IRQs/FIQs at ARM side
MRS R0, CPSR ; Read the CPSR
ORR R0, R0, #0x80/0x40 ; Set the I/F bit
MSR CPSR, R0 ; Write it back to disable IRQs
; Step 2 : Restore the INTC_THRESHOLD register from R12
LDR R0, INTC_THRESHOLD_ADDR
STR R12, [R0]
; Step 3 : Restore critical context
MSR SPSR, R11 ; Restore the SPSR from R11
LDMFD SP!, {R0-R12, LR} ; Restore working registers and Link register
; Return after handling the interrupt
SUBS PC, LR, #4

```

Figure 6-3 shows the nested IRQ/FIQ processing sequence from the originating device peripheral module to the main program interruption.

Figure 6-3. Nested IRQ/FIQ Processing Sequence

### 6.2.4 Interrupt Preemption

If wanting to enable pre-emption by higher priority interrupts, the ISR should read the active interrupt priority and write it to the priority threshold register. Writing a '1' to the appropriate NEW\_IRQ\_AGR or NEW\_FIQ\_AGR bits of the CONTROL register while still processing the interrupt will now allow only higher priority interrupts to pre-empt.

For each level of pre-emption, the programmer must save the threshold value before modifying it and restore it at the end of that ISR level.

The priority threshold mechanism is enabled automatically when writing a priority in the range of 0 to 7Fh as will be read from the IRQ\_PRIORITY and FIQ\_PRIORITY registers. Writing a value of FFh (reset default) disables the priority threshold mechanism.

When the hardware priority threshold is in use the priorities of interrupts selected as FIQ or IRQ become linked, otherwise they are independent. When linked, it is required that all FIQ priorities be set higher than all IRQ priorities to maintain the relative priority of FIQ over IRQ.

When handling FIQs using the priority threshold mechanism, it is required to write both New FIQ Agreement and New IRQ Agreement bits at the same time to cover the case that the new priority threshold is applied while an IRQ sorting is in progress. This IRQ will not have been seen by the ARM as it will have been masked on entry to the FIQ ISR. However, the source of the IRQ will remain active and it will be finally processed when the priority threshold falls to a low enough priority. The precaution of writing to New FIQ Agreement (as well as New IRQ Agreement) is not required during an IRQ ISR as FIQ sorting will not be affected (provided all FIQ priorities are higher than all IRQ priorities).

### 6.2.5 ARM A8 INTC Spurious Interrupt Handling

The spurious flag indicates whether the result of the sorting (a window of 10 INTC functional clock cycles after the interrupt assertion) is invalid. The sorting is invalid if:

- The interrupt that triggered the sorting is no longer active during the sorting.
- A change in the mask has affected the result during the sorting time.

As a result, the values in the INTC\_MIRn, INTC\_ILRm, or INTC\_MIR\_SETn registers must not be changed while the corresponding interrupt is asserted. Only the active interrupt input that triggered the sort can be masked before it turn on the sort. If these registers are changed within the 10-cycle window after the interrupt assertion. The resulting values of the following registers become invalid:

- INTC\_SIR\_IRQ
- INTC\_SIR\_FIQ
- INTC\_IRQ\_PRIORITY
- INTC\_FIQ\_PRIORITY

This condition is detected for both IRQ and FIQ, and the invalid status is flagged across the SPURIOUSIRQFLAG (see NOTE 1) and SPURIOUSFIQFLAG (see NOTE 2) bit fields in the SIR and PRIORITY registers. A 0 indicates valid and a 1 indicates invalid interrupt number and priority. The invalid indication can be tested in software as a false register value.

---

**NOTE:**

1. The INTC\_SIR\_IRQ[31:7] SPURIOUSIRQFLAG bit field is a copy of the INTC\_IRQ\_PRIORITY[31:7] SPURIOUSIRQFLAG bit field.
  2. The INTC\_SIR\_FIQ[31:7] SPURIOUSFIQFLAG bit field is a copy of the INTC\_FIQ\_PRIORITY[31:7] SPURIOUSFIQFLAG bit field.

### 6.5.1.1 INTC\_REVISION Register (offset = 0h) [reset = 50h]

INTC\_REVISION is shown in [Figure 6-4](#) and described in [Table 6-4](#).

This register contains the IP revision code

**Figure 6-4. INTC\_REVISION Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-4. INTC\_REVISION Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	Reserved	R	0h	Reads returns 0
7-0	Rev	R	50h	IP revision [7:4] Major revision [3:0] Minor revision Examples: 0x10 for 1.0, 0x21 for 2.1

### 6.5.1.2 INTC\_SYSCONFIG Register (offset = 10h) [reset = 0h]

INTC\_SYSCONFIG is shown in [Figure 6-5](#) and described in [Table 6-5](#).

This register controls the various parameters of the OCP interface

**Figure 6-5. INTC\_SYSCONFIG Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-5. INTC\_SYSCONFIG Register Field Descriptions**

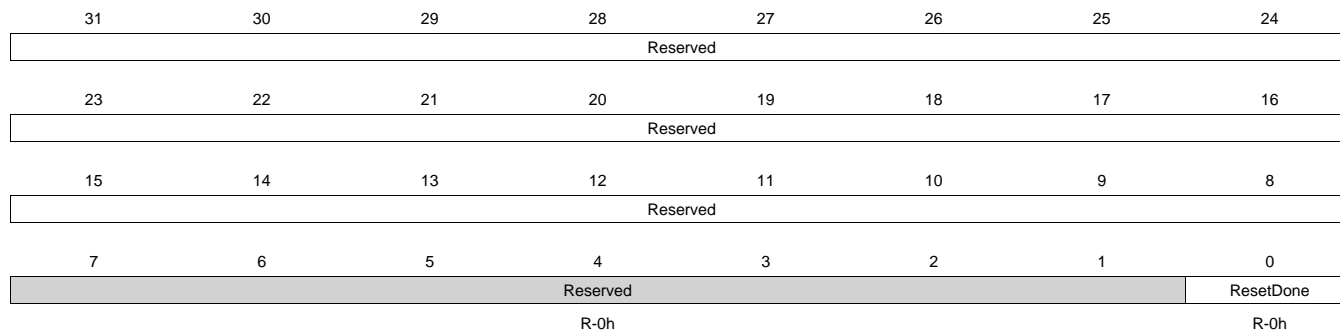

Bit	Field	Type	Reset	Description
4-3	Reserved	R	0h	Write 0's for future compatibility. Reads returns 0
1	SoftReset	R/W	0h	Software reset. Set this bit to trigger a module reset. The bit is automatically reset by the hardware. During reads, it always returns 0. 0x0(Read) = always_Always returns 0 0x1(Read) = never_never happens
0	Autoidle	R/W	0h	Internal OCP clock gating strategy 0x0 = clkfree : OCP clock is free running 0x1 = autoClkGate : Automatic OCP clock gating strategy is applied, based on the OCP interface activity

### 6.5.1.3 INTC\_SYSSTATUS Register (offset = 14h) [reset = 0h]

INTC\_SYSSTATUS is shown in [Figure 6-6](#) and described in [Table 6-6](#).

This register provides status information about the module

**Figure 6-6. INTC\_SYSSTATUS Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-6. INTC\_SYSSTATUS Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-1	Reserved	R	0h	Reserved for OCP socket status information Read returns 0
0	ResetDone	R	0h	Internal reset monitoring 0x0 = rstOngoing : Internal module reset is on-going 0x1 = rstComp : Reset completed

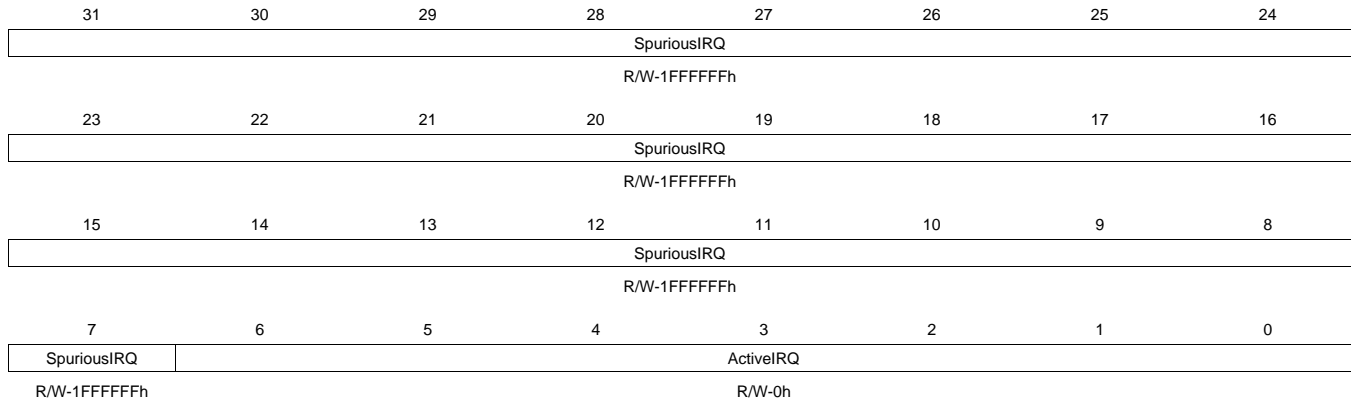

### 6.5.1.4 INTC\_SIR\_IRQ Register (offset = 40h) [reset = FFFFFFF80h]

INTC\_SIR\_IRQ is shown in [Figure 6-7](#) and described in [Table 6-7](#).

This register supplies the currently active IRQ interrupt number.

**Figure 6-7. INTC\_SIR\_IRQ Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

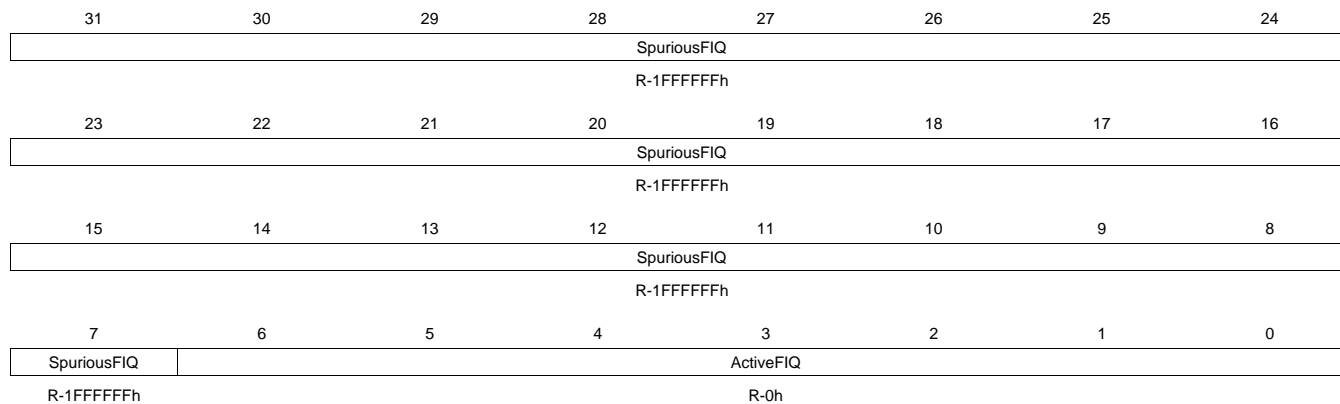

**Table 6-7. INTC\_SIR\_IRQ Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-7	SpuriousIRQ	R/W	1FFFFFFh	Spurious IRQ flag
6-0	ActiveIRQ	R/W	0h	Active IRQ number

**6.5.1.5 INTC\_SIR\_FIQ Register (offset = 44h) [reset = FFFFFFF80h]**

INTC\_SIR\_FIQ is shown in [Figure 6-8](#) and described in [Table 6-8](#).

This register supplies the currently active FIQ interrupt number

**Figure 6-8. INTC\_SIR\_FIQ Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-8. INTC\_SIR\_FIQ Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-7	SpuriousFIQ	R	1FFFFFFh	Spurious FIQ flag
6-0	ActiveFIQ	R	0h	Active FIQ number

### 6.5.1.6 INTC\_CONTROL Register (offset = 48h) [reset = 0h]

INTC\_CONTROL is shown in [Figure 6-9](#) and described in [Table 6-9](#).

This register contains the new interrupt agreement bits

**Figure 6-9. INTC\_CONTROL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-9. INTC\_CONTROL Register Field Descriptions**

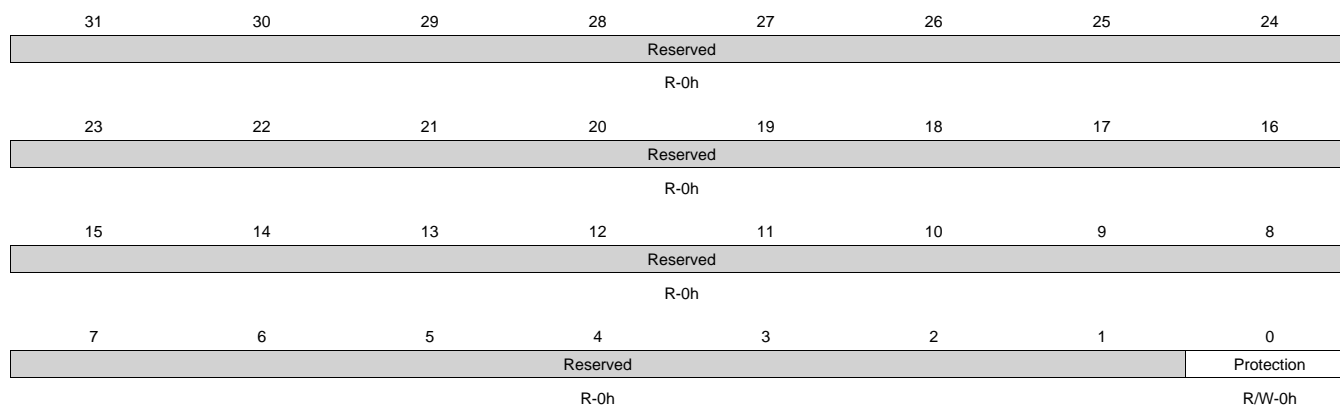

Bit	Field	Type	Reset	Description
31-2	Reserved	R	0h	Write 0's for future compatibility. Reads returns 0
1	NewFIQAgr	W	0h	Reset FIQ output and enable new FIQ generation 0x0(Write) = nofun_no function effect 0x1(Write) = NewFiq_Reset FIQ output and enable new FIQ generation
0	NewIRQAgr	W	0h	New IRQ generation 0x0(Write) = nofun_no function effect 0x1(Write) = NewIrq_Reset IRQ output and enable new IRQ generation

### 6.5.1.7 INTC\_PROTECTION Register (offset = 4Ch) [reset = 0h]

INTC\_PROTECTION is shown in [Figure 6-10](#) and described in [Table 6-10](#).

This register controls protection of the other registers. This register can only be accessed in privileged mode, regardless of the current value of the protection bit.

**Figure 6-10. INTC\_PROTECTION Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-10. INTC\_PROTECTION Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	Write 0's for future compatibility. Reads returns 0
0	Protection	R/W	0h	Protection mode 0x0 = ProtMDis : Protection mode disabled (default) 0x1 = ProtMEnb : Protection mode enabled. When enabled, only privileged mode can access registers.

### 6.5.1.8 INTC\_IDLE Register (offset = 50h) [reset = 0h]

INTC\_IDLE is shown in [Figure 6-11](#) and described in [Table 6-11](#).

This register controls the clock auto-idle for the functional clock and the input synchronisers

**Figure 6-11. INTC\_IDLE Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

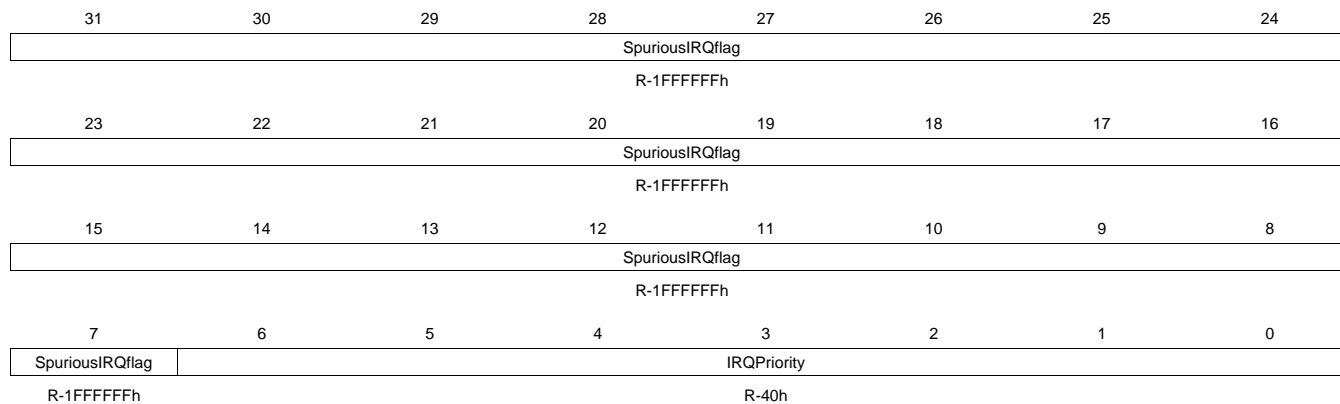

**Table 6-11. INTC\_IDLE Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	Reserved	R	0h	Write 0's for future compatibility. Reads returns 0
1	Turbo	R/W	0h	Input synchroniser clock auto-gating 0x0 = SyncFree : Input synchroniser clock is free running (default) 0x1 = SyncAuto : Input synchroniser clock is auto-gated based on interrupt input activity
0	FuncIdle	R/W	0h	Functional clock auto-idle mode 0x0 = FuncAuto : Functional clock gating strategy is applied (default) 0x1 = FuncFree : Functional clock is free-running

**6.5.1.9 INTC\_IRQ\_PRIORITY Register (offset = 60h) [reset = FFFFFFFC0h]**

INTC\_IRQ\_PRIORITY is shown in [Figure 6-12](#) and described in [Table 6-12](#).

This register supplies the currently active IRQ priority level

**Figure 6-12. INTC\_IRQ\_PRIORITY Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-12. INTC\_IRQ\_PRIORITY Register Field Descriptions**

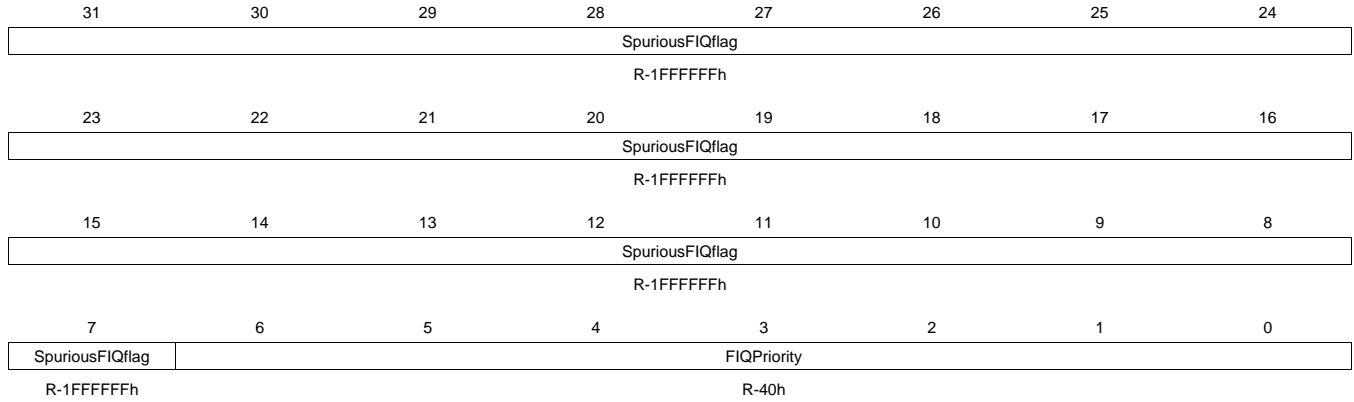

Bit	Field	Type	Reset	Description
31-7	SpuriousIRQflag	R	1FFFFFFh	Spurious IRQ flag
6-0	IRQPriority	R	40h	Current IRQ priority

**6.5.1.10 INTC\_FIQ\_PRIORITY Register (offset = 64h) [reset = FFFFFFFC0h]**

INTC\_FIQ\_PRIORITY is shown in [Figure 6-13](#) and described in [Table 6-13](#).

This register supplies the currently active FIQ priority level

**Figure 6-13. INTC\_FIQ\_PRIORITY Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

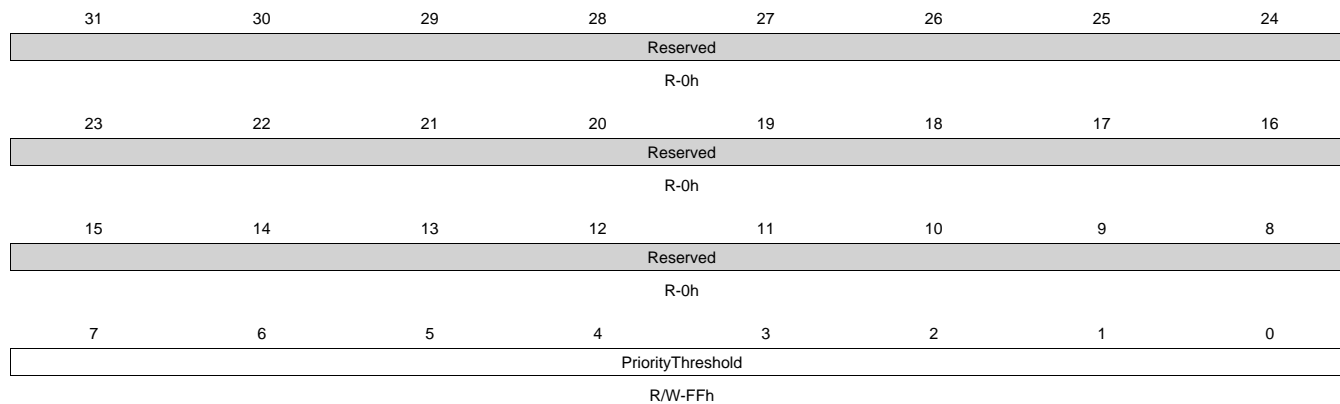

**Table 6-13. INTC\_FIQ\_PRIORITY Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-7	SpuriousFIQflag	R	1FFFFFFFh	Spurious FIQ flag
6-0	FIQPriority	R	40h	Current FIQ priority

**6.5.1.11 INTC\_THRESHOLD Register (offset = 68h) [reset = FFh]**

INTC\_THRESHOLD is shown in [Figure 6-14](#) and described in [Table 6-14](#).

This register sets the priority threshold

**Figure 6-14. INTC\_THRESHOLD Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-14. INTC\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	Reserved	R	0h	Reads returns 0
7-0	PriorityThreshold	R/W	FFh	Priority threshold (used values 0x00-0x1f or 0x00-0x3f, 0xff disables the threshold).

**6.5.1.12 INTC\_ITR0 Register (offset = 80h) [reset = 0h]**

INTC\_ITR0 is shown in [Figure 6-15](#) and described in [Table 6-15](#).

This register shows the raw interrupt input status before masking

**Figure 6-15. INTC\_ITR0 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-15. INTC\_ITR0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	ltr	R	0h	Interrupt status before masking

### 6.5.1.13 INTC\_MIR0 Register (offset = 84h) [reset = FFFFFFFFh]

INTC\_MIR0 is shown in [Figure 6-16](#) and described in [Table 6-16](#).

This register contains the interrupt mask

**Figure 6-16. INTC\_MIR0 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-16. INTC\_MIR0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	Mir	R/W	FFFFFFFh	Interrupt mask

### 6.5.1.14 INTC\_MIR\_CLEAR0 Register (offset = 88h) [reset = 0h]

INTC\_MIR\_CLEAR0 is shown in [Figure 6-17](#) and described in [Table 6-17](#).

This register is used to clear the interrupt mask bits.

**Figure 6-17. INTC\_MIR\_CLEAR0 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-17. INTC\_MIR\_CLEAR0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MirClear	W	0h	Write 1 clears the mask bit to 0, reads return 0

**6.5.1.15 INTC\_MIR\_SET0 Register (offset = 8Ch) [reset = 0h]**

INTC\_MIR\_SET0 is shown in [Figure 6-18](#) and described in [Table 6-18](#).

This register is used to set the interrupt mask bits.

**Figure 6-18. INTC\_MIR\_SET0 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-18. INTC\_MIR\_SET0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MirSet	W	0h	Write 1 sets the mask bit to 1, reads return 0

### 6.5.1.16 INTC\_ISR\_SET0 Register (offset = 90h) [reset = 0h]

INTC\_ISR\_SET0 is shown in [Figure 6-19](#) and described in [Table 6-19](#).

This register is used to set the software interrupt bits. It is also used to read the currently active software interrupts.

**Figure 6-19. INTC\_ISR\_SET0 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-19. INTC\_ISR\_SET0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	IsrSet	R/W	0h	Reads returns the currently active software interrupts, Write 1 sets the software interrupt bits to 1

### 6.5.1.17 INTC\_ISR\_CLEAR0 Register (offset = 94h) [reset = 0h]

INTC\_ISR\_CLEAR0 is shown in [Figure 6-20](#) and described in [Table 6-20](#).

This register is used to clear the software interrupt bits

**Figure 6-20. INTC\_ISR\_CLEAR0 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-20. INTC\_ISR\_CLEAR0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	IsrClear	W	0h	Write 1 clears the software interrupt bits to 0, reads return 0

**6.5.1.18 INTC\_PENDING\_IRQ0 Register (offset = 98h) [reset = 0h]**

INTC\_PENDING\_IRQ0 is shown in [Figure 6-21](#) and described in [Table 6-21](#).

This register contains the IRQ status after masking

**Figure 6-21. INTC\_PENDING\_IRQ0 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-21. INTC\_PENDING\_IRQ0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	PendingIRQ	R	0h	IRQ status after masking

**6.5.1.19 INTC\_PENDING\_FIQ0 Register (offset = 9Ch) [reset = 0h]**

INTC\_PENDING\_FIQ0 is shown in [Figure 6-22](#) and described in [Table 6-22](#).

This register contains the FIQ status after masking

**Figure 6-22. INTC\_PENDING\_FIQ0 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-22. INTC\_PENDING\_FIQ0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	PendingFIQ	R	0h	FIQ status after masking

**6.5.1.20 INTC\_ITR1 Register (offset = A0h) [reset = 0h]**

INTC\_ITR1 is shown in [Figure 6-23](#) and described in [Table 6-23](#).

This register shows the raw interrupt input status before masking

**Figure 6-23. INTC\_ITR1 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-23. INTC\_ITR1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	ltr	R	0h	Interrupt status before masking

**6.5.1.21 INTC\_MIR1 Register (offset = A4h) [reset = FFFFFFFFh]**

INTC\_MIR1 is shown in [Figure 6-24](#) and described in [Table 6-24](#).

This register contains the interrupt mask

**Figure 6-24. INTC\_MIR1 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-24. INTC\_MIR1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	Mir	R/W	FFFFFFFh	Interrupt mask

**6.5.1.22 INTC\_MIR\_CLEAR1 Register (offset = A8h) [reset = 0h]**

INTC\_MIR\_CLEAR1 is shown in [Figure 6-25](#) and described in [Table 6-25](#).

This register is used to clear the interrupt mask bits.

**Figure 6-25. INTC\_MIR\_CLEAR1 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-25. INTC\_MIR\_CLEAR1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MirClear	W	0h	Write 1 clears the mask bit to 0, reads return 0

### 6.5.1.23 INTC\_MIR\_SET1 Register (offset = ACh) [reset = 0h]

INTC\_MIR\_SET1 is shown in [Figure 6-26](#) and described in [Table 6-26](#).

This register is used to set the interrupt mask bits.

**Figure 6-26. INTC\_MIR\_SET1 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-26. INTC\_MIR\_SET1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MirSet	W	0h	Write 1 sets the mask bit to 1, reads return 0

**6.5.1.24 INTC\_ISR\_SET1 Register (offset = B0h) [reset = 0h]**

INTC\_ISR\_SET1 is shown in [Figure 6-27](#) and described in [Table 6-27](#).

This register is used to set the software interrupt bits. It is also used to read the currently active software interrupts.

**Figure 6-27. INTC\_ISR\_SET1 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-27. INTC\_ISR\_SET1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	IsrSet	R/W	0h	Reads returns the currently active software interrupts, Write 1 sets the software interrupt bits to 1

**6.5.1.25 INTC\_ISR\_CLEAR1 Register (offset = B4h) [reset = 0h]**

INTC\_ISR\_CLEAR1 is shown in [Figure 6-28](#) and described in [Table 6-28](#).

This register is used to clear the software interrupt bits

**Figure 6-28. INTC\_ISR\_CLEAR1 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-28. INTC\_ISR\_CLEAR1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	IsrClear	W	0h	Write 1 clears the software interrupt bits to 0, reads return 0

### 6.5.1.26 INTC\_PENDING\_IRQ1 Register (offset = B8h) [reset = 0h]

INTC\_PENDING\_IRQ1 is shown in [Figure 6-29](#) and described in [Table 6-29](#).

This register contains the IRQ status after masking

**Figure 6-29. INTC\_PENDING\_IRQ1 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-29. INTC\_PENDING\_IRQ1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	PendingIRQ	R	0h	IRQ status after masking

**6.5.1.27 INTC\_PENDING\_FIQ1 Register (offset = BCh) [reset = 0h]**

INTC\_PENDING\_FIQ1 is shown in [Figure 6-30](#) and described in [Table 6-30](#).

This register contains the FIQ status after masking

**Figure 6-30. INTC\_PENDING\_FIQ1 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-30. INTC\_PENDING\_FIQ1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	PendingFIQ	R	0h	FIQ status after masking

**6.5.1.28 INTC\_ITR2 Register (offset = C0h) [reset = 0h]**

INTC\_ITR2 is shown in [Figure 6-31](#) and described in [Table 6-31](#).

This register shows the raw interrupt input status before masking

**Figure 6-31. INTC\_ITR2 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-31. INTC\_ITR2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	ltr	R	0h	Interrupt status before masking

**6.5.1.29 INTC\_MIR2 Register (offset = C4h) [reset = FFFFFFFFh]**

INTC\_MIR2 is shown in [Figure 6-32](#) and described in [Table 6-32](#).

This register contains the interrupt mask

**Figure 6-32. INTC\_MIR2 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-32. INTC\_MIR2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	Mir	R/W	FFFFFFFh	Interrupt mask

**6.5.1.30 INTC\_MIR\_CLEAR2 Register (offset = C8h) [reset = 0h]**

INTC\_MIR\_CLEAR2 is shown in [Figure 6-33](#) and described in [Table 6-33](#).

This register is used to clear the interrupt mask bits.

**Figure 6-33. INTC\_MIR\_CLEAR2 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-33. INTC\_MIR\_CLEAR2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MirClear	W	0h	Write 1 clears the mask bit to 0, reads return 0

**6.5.1.31 INTC\_MIR\_SET2 Register (offset = CCh) [reset = 0h]**

INTC\_MIR\_SET2 is shown in [Figure 6-34](#) and described in [Table 6-34](#).

This register is used to set the interrupt mask bits.

**Figure 6-34. INTC\_MIR\_SET2 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-34. INTC\_MIR\_SET2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MirSet	W	0h	Write 1 sets the mask bit to 1, reads return 0

**6.5.1.32 INTC\_ISR\_SET2 Register (offset = D0h) [reset = 0h]**

INTC\_ISR\_SET2 is shown in [Figure 6-35](#) and described in [Table 6-35](#).

This register is used to set the software interrupt bits. It is also used to read the currently active software interrupts.

**Figure 6-35. INTC\_ISR\_SET2 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-35. INTC\_ISR\_SET2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	IsrSet	R/W	0h	Reads returns the currently active software interrupts, Write 1 sets the software interrupt bits to 1

### 6.5.1.33 INTC\_ISR\_CLEAR2 Register (offset = D4h) [reset = 0h]

INTC\_ISR\_CLEAR2 is shown in [Figure 6-36](#) and described in [Table 6-36](#).

This register is used to clear the software interrupt bits

**Figure 6-36. INTC\_ISR\_CLEAR2 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-36. INTC\_ISR\_CLEAR2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	IsrClear	W	0h	Write 1 clears the software interrupt bits to 0, reads return 0

**6.5.1.34 INTC\_PENDING\_IRQ2 Register (offset = D8h) [reset = 0h]**

INTC\_PENDING\_IRQ2 is shown in [Figure 6-37](#) and described in [Table 6-37](#).

This register contains the IRQ status after masking

**Figure 6-37. INTC\_PENDING\_IRQ2 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-37. INTC\_PENDING\_IRQ2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	PendingIRQ	R	0h	IRQ status after masking

**6.5.1.35 INTC\_PENDING\_FIQ2 Register (offset = DCh) [reset = 0h]**

INTC\_PENDING\_FIQ2 is shown in [Figure 6-38](#) and described in [Table 6-38](#).

This register contains the FIQ status after masking

**Figure 6-38. INTC\_PENDING\_FIQ2 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-38. INTC\_PENDING\_FIQ2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	PendingFIQ	R	0h	FIQ status after masking

**6.5.1.36 INTC\_ITR3 Register (offset = E0h) [reset = 0h]**

INTC\_ITR3 is shown in [Figure 6-39](#) and described in [Table 6-39](#).

This register shows the raw interrupt input status before masking

**Figure 6-39. INTC\_ITR3 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-39. INTC\_ITR3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	ltr	R	0h	Interrupt status before masking

**6.5.1.37 INTC\_MIR3 Register (offset = E4h) [reset = FFFFFFFFh]**

INTC\_MIR3 is shown in [Figure 6-40](#) and described in [Table 6-40](#).

This register contains the interrupt mask

**Figure 6-40. INTC\_MIR3 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-40. INTC\_MIR3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	Mir	R/W	FFFFFFFh	Interrupt mask

**6.5.1.38 INTC\_MIR\_CLEAR3 Register (offset = E8h) [reset = 0h]**

INTC\_MIR\_CLEAR3 is shown in [Figure 6-41](#) and described in [Table 6-41](#).

This register is used to clear the interrupt mask bits.

**Figure 6-41. INTC\_MIR\_CLEAR3 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-41. INTC\_MIR\_CLEAR3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MirClear	W	0h	Write 1 clears the mask bit to 0, reads return 0

**6.5.1.39 INTC\_MIR\_SET3 Register (offset = ECh) [reset = 0h]**

INTC\_MIR\_SET3 is shown in [Figure 6-42](#) and described in [Table 6-42](#).

This register is used to set the interrupt mask bits.

**Figure 6-42. INTC\_MIR\_SET3 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-42. INTC\_MIR\_SET3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MirSet	W	0h	Write 1 sets the mask bit to 1, reads return 0

**6.5.1.40 INTC\_ISR\_SET3 Register (offset = F0h) [reset = 0h]**

INTC\_ISR\_SET3 is shown in [Figure 6-43](#) and described in [Table 6-43](#).

This register is used to set the software interrupt bits. It is also used to read the currently active software interrupts.

**Figure 6-43. INTC\_ISR\_SET3 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-43. INTC\_ISR\_SET3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	IsrSet	R/W	0h	Reads returns the currently active software interrupts, Write 1 sets the software interrupt bits to 1

**6.5.1.41 INTC\_ISR\_CLEAR3 Register (offset = F4h) [reset = 0h]**

INTC\_ISR\_CLEAR3 is shown in [Figure 6-44](#) and described in [Table 6-44](#).

This register is used to clear the software interrupt bits

**Figure 6-44. INTC\_ISR\_CLEAR3 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-44. INTC\_ISR\_CLEAR3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	IsrClear	W	0h	Write 1 clears the software interrupt bits to 0, reads return 0

### 6.5.1.42 INTC\_PENDING\_IRQ3 Register (offset = F8h) [reset = 0h]

INTC\_PENDING\_IRQ3 is shown in [Figure 6-45](#) and described in [Table 6-45](#).

This register contains the IRQ status after masking

**Figure 6-45. INTC\_PENDING\_IRQ3 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-45. INTC\_PENDING\_IRQ3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	PendingIRQ	R	0h	IRQ status after masking

**6.5.1.43 INTC\_PENDING\_FIQ3 Register (offset = FCh) [reset = 0h]**

INTC\_PENDING\_FIQ3 is shown in [Figure 6-46](#) and described in [Table 6-46](#).

This register contains the FIQ status after masking

**Figure 6-46. INTC\_PENDING\_FIQ3 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-46. INTC\_PENDING\_FIQ3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	PendingFIQ	R	0h	FIQ status after masking

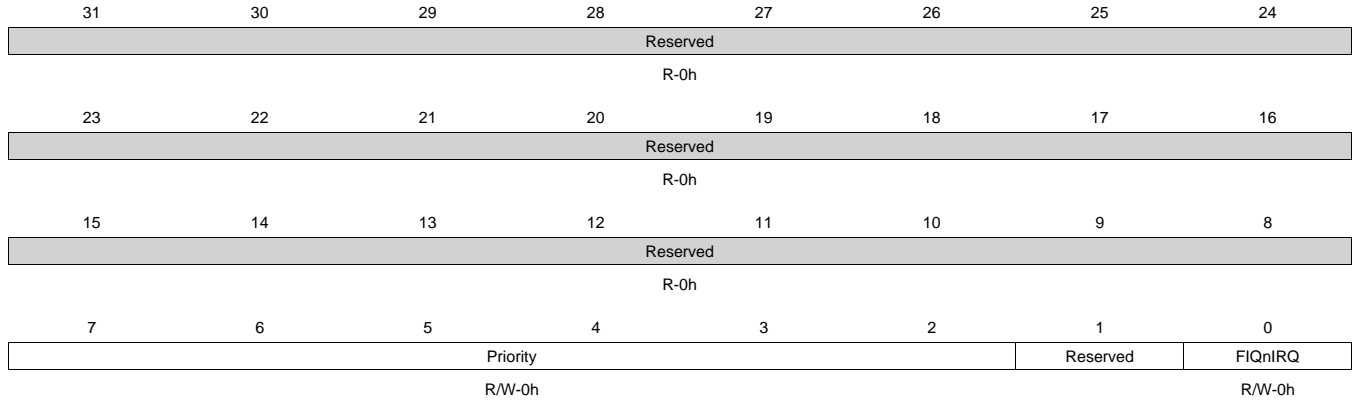

**6.5.1.44 INTC\_ILR Register (offset = 100h to 2FCh) [reset = 0h]**

INTC\_ILR0 to INTC\_ILR127 is shown in [Figure 6-47](#) and described in [Table 6-47](#).

The INTC\_ILRx registers contain the priority for the interrupts and the FIQ/IRQ steering.

**Figure 6-47. INTC\_ILR0 to INTC\_ILR127 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-47. INTC\_ILR0 to INTC\_ILR127 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	Reserved	R	0h	Write 0's for future compatibility. Reads returns 0
7-2	Priority	R/W	0h	Interrupt priority
0	FIQnIRQ	R/W	0h	Interrupt IRQ FIQ mapping 0x0 = IntIRQ : Interrupt is routed to IRQ. 0x1 = IntFIQ : Interrupt is routed to FIQ (this selection is reserved on GP devices).

## Memory Subsystem

---

---

---

This chapter describes the memory subsystem of the device.

Topic	Page
7.1 GPMC .....	251

7.3 EMIF .....	400
7.4 ELM .....	476

## 7.1 GPMC

### 7.1.1 Introduction

The general-purpose memory controller (GPMC) is an unified memory controller dedicated to interfacing external memory devices:

- Asynchronous SRAM-like memories and application-specific integrated circuit (ASIC) devices
- Asynchronous, synchronous, and page mode (only available in non-multiplexed mode) burst NOR flash devices
- NAND Flash
- Pseudo-SRAM devices

#### 7.1.1.1 GPMC Features

The general features of the GPMC module include:

- Data path to external memory device can be 16- or 8-bit wide
- 32-bit OCPIP 2.0 compliant core, single slave interface. Support non-wrapping and wrapping burst up to 16x32bits.
- Up to 100 MHz external memory clock performance (single device)
- Support for the following memory types:
  - External asynchronous or synchronous 8-bit width memory or device (non burst device)
  - External asynchronous or synchronous 16-bit width memory or device
  - External 16-bit non-multiplexed NOR Flash device
  - External 16-bit address and data multiplexed NOR Flash device
  - External 8-bit and 16-bit NAND flash device
  - External 16-bit pSRAM device
- Up to 16-bit ECC support for NAND flash using BCH code (t=4, 8 or 16) or Hamming code for 8-bit or 16-bit NAND-flash, organized with page size of 512 bytes, 1K bytes, or more.
- Support 512M Bytes maximum addressing capability which can be divided into seven independent chip-select with programmable bank size and base address on 16M Bytes, 32M Bytes, 64M Bytes, or 128M Bytes boundary
- Fully pipelined operation for optimal memory bandwidth usage
- Support external device clock frequency of 1, 2, 3 and 4 divider from L3 clock.
- Support programmable auto-clock gating when there is no access.
- Support Midlreq/SidleAck protocol
- Support the following interface protocols when communicating with external memory or external devices.
  - Asynchronous read/write access
  - Asynchronous read page access (4-8-16 Word16)
  - Synchronous read/write access
  - Synchronous read burst access without wrap capability (4-8-16 Word16)
  - Synchronous read burst access with wrap capability (4-8-16 Word16)
- Address and Data multiplexed access
- Each chip-select as independent and programmable control signal timing parameters for Setup and Hold time. Parameters are set according to the memory device timing parameters, with one L3 clock cycle timing granularity.
- Flexible internal access time control (wait state) and flexible handshake mode using external WAIT pins monitoring (up to two WAIT pins)
- Support bus keeping
- Support bus turn around

- Pre-fetch and write posting engine associated with system DMA to get full performance from NAND device with minimum impact on NOR/SRAM concurrent access.
- On the fly ECC Hamming Code calculation to improve NAND usage reliability with minimum impact on SW

### 7.1.1.2 Block Diagram

The GPMC can access various external devices through the L3 Slow Interconnect. The flexible programming model allows a wide range of attached device types and access schemes. Based on the programmed configuration bit fields stored in the GPMC registers, the GPMC is able to generate all control signals timing depending on the attached device and access type. Given the chip-select decoding and its associated configuration registers, the GPMC selects the appropriate device type control signals timing.

[Figure 7-1](#) shows the GPMC functional block diagram. The GPMC consists of six blocks:

- Interconnect port interface
- Address decoder, GPMC configuration, and chip-select configuration register file
- Access engine
- Prefetch and write-posting engine
- Error correction code engine (ECC)
- External device/memory port interface

Figure 7-1. GPMC Block Diagram

### 7.1.1.3 Unsupported GPMC Features

The following module features are not supported in this device.

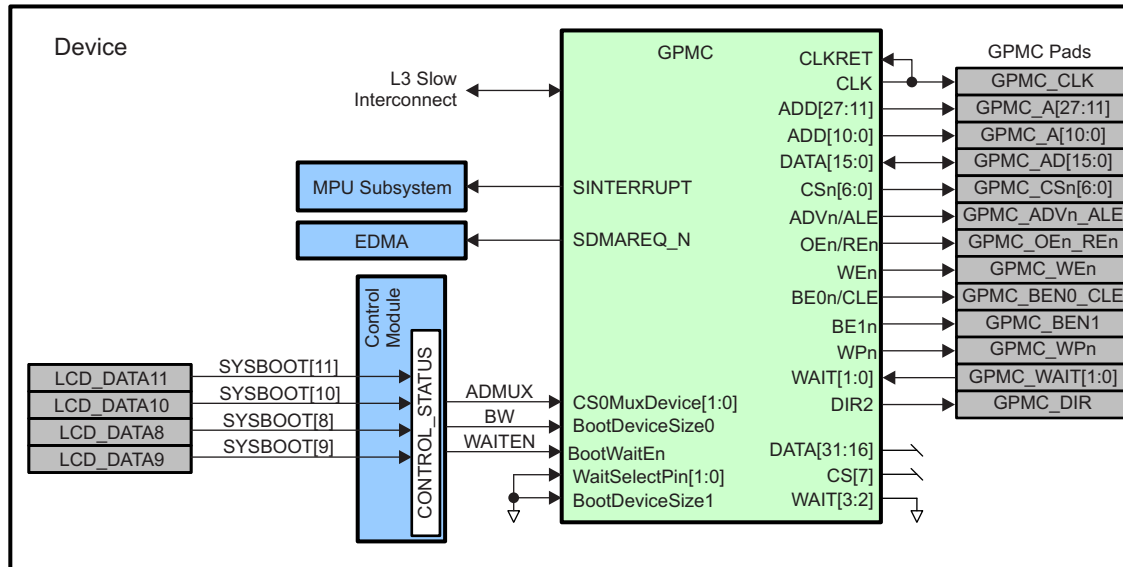

Table 7-1. Unsupported GPMC Features

Feature	Reason
Chip Select 7	Not pinned out
32-bit devices	Only 16 data lines pinned out
WAIT[3:2]	Not pinned out. All CS regions must use WAIT0 or WAIT1

### 7.1.2 Integration

An instantiation of GPMC provides this device with access to NAND Flash, NOR Flash, and other asynchronous and synchronous interface peripherals. Figure 7-2 shows the integration of the GPMC module in this device.

Figure 7-2. GPMC Integration

#### 7.1.2.1 GPMC Connectivity Attributes

The general connectivity attributes for the GPMC module are shown in Table 7-2.

Table 7-2. GPMC Connectivity Attributes

Attributes	Type
Power Domain	Peripheral Domain
Clock Domain	PD_PER_L3S_GCLK
Reset Signals	PER_DOM_RST_N
Idle/Wakeup Signals	Smart Idle
Interrupt Requests	1 interrupt to MPU Subsystem (GPMCINT)
DMA Requests	1 DMA request to EDMA (GPMCEVT)
Physical Address	L3 Slow Slave Port Memory and control register regions qualified with MAddressSpace bit

#### 7.1.2.2 GPMC Clock and Reset Management

The GPMC is a synchronous design and operates from the same clock as the Slow L3. All timings use this clock as a reference.

Table 7-3. GPMC Clock Signals

Clock Signal	Max Freq	Reference / Source	Comments
prcm_gpmc_clk Interface / Functional clock	100 MHz	CORE_CLKOUTM4 / 2	pd_per_l3s_gclk From PRCM

### 7.1.2.3 GPMC Signal List

The GPMC external interface signals are shown in [Table 7-4](#).

**Table 7-4. GPMC Signal List**

Signal	Type	Description
GPMC_A[27:0]	O	Address outputs
GPMC_AD[15:0]	I/O	Data - multiplexed with Address[16:1] and Address[27:12]
GPMC_CS[n:0]	O	Chip selects (active low)
GPMC_CLK	O <sup>(1)</sup>	Synchronous mode clock
GPMC_ADVn_ALE	O	Address Valid or Address Latch Enable depending if NOR or NAND protocol memories are selected.
GPMC_OEn_REn	O	Output Enable (active low). Also used as Read Enable (active low) for NAND protocol memories
GPMC_WEn	O	Write Enable (active low)
GPMC_BE0n_CLE	O	Lower Byte Enable (active low). Also used as Command Latch Enable for NAND protocol memories
GPMC_BE1n	O	Upper Byte Enable (active low)
GPMC_WPn	O	Write Protect (active low)
GPMC_WAIT[1:0]	I	External wait signal for NOR and NAND protocol memories.
GPMC_DIR	O	GPMC.D[15:0] signal direction control Low during transmit (for write access: data OUT from GPMC to memory) High during receive (for read access: data IN from memory to GPMC)

<sup>(1)</sup> GPMC\_CLK is also used as a re-timing input. The associated CONF\_<module>\_<pin>\_RXACTIVE bit for the output clock must be set to 1 to enable the clock input back to the module. It is also recommended to place a 33-ohm resistor in series (close to the processor) to avoid signal reflections.

### 7.1.3 Functional Description

#### 7.1.3.1 GPMC Signals

Table 7-5 shows the use of address and data GPMC controller pins based on the type of external device.

**Table 7-5. GPMC Pin Multiplexing Options**

GPMC Signal	Non Multiplexed Address Data 16-Bit Device <sup>(1)</sup>	Non Multiplexed Address Data 8-Bit Device	Multiplexed Address Data 16-Bit Device <sup>(1)</sup>	16-Bit NAND Device	8-Bit NAND Device
GPMC_A[27]	A26	A27	A26	Not Used	Not Used

GPMC_CS[2]n	CS2n	CS2n	CS2n	CE2n	CE2n
GPMC_CS[3]n	CS3n	CS3n	CS3n	CE3n	CE3n
GPMC_CS[4]n	CS4n	CS4n	CS4n	CE4n	CE4n
GPMC_CS[5]n	CS5n	CS5n	CS5n	CE5n	CE5n
GPMC_CS[6]n	CS6n	CS6n	CS6n	CE6n	CE6n
GPMC_ADVn_ALE	ADVn (Address Value)	ADVn (Address Value)	ADVn (Address Value)	ALE (address latch enable)	ALE (address latch enable)
GPMC_BE0n_CLE	BE0n (Byte Enable)	BE0n (Byte Enable)	BE0n (Byte Enable)	CLE (command latch enable)	CLE (command latch enable)
GPMC_BE1n	BE1n	BE1n	BE1n		
GPMC_CLK	CLK	CLK	CLK		
GPMC_OE_REn	OEn (Output Enable)	OEn (Output Enable)	OEn (Output Enable)	REn (read enable)	REn (read enable)
GPMC_WAIT0	WAIT0	WAIT0	WAIT0	R/B0n (ready/busy)	R/B0n (ready/busy)
GPMC_WAIT1	WAIT1	WAIT1	WAIT1	R/B1n (ready/busy)	R/B1n (ready/busy)
GPMC_WEn	WEn (Write Enable)	WEn (Write Enable)	WEn (Write Enable)	WEn (write enable)	WEn (write enable)
GPMC_WPn	WPn (Write Protect)	WPn (Write Protect)	WPn (Write Protect)	WPn (write protect)	WPn (write protect)

With all device types, the GPMC does not drive unnecessary address lines. They stay at their reset value of 00.

Address mapping supports address/data-multiplexed 16-bit wide devices:

- The NOR flash memory controller still supports non-multiplexed address and data memory devices.
- Multiplexing mode can be selected through the GPMC\_CONFIG1\_i[9-8] MUXADDDATA bit field.
- Asynchronous page mode is not supported for multiplexed address and data devices.

### 7.1.3.2 GPMC Modes

This section shows three GPMC external connections options:

- [Figure 7-3](#) shows a connection between the GPMC and a 16-bit synchronous address/data-multiplexed (or AAD-multiplexed, but this protocol use less address pins) external memory device.
- [Figure 7-4](#) shows a connection between the GPMC and a 16-bit synchronous nonmultiplexed external memory device .
- [Figure 7-5](#) shows a connection between the GPMC and a 8-bit NAND device

**Figure 7-3. GPMC to 16-Bit Address/Data-Multiplexed Memory**

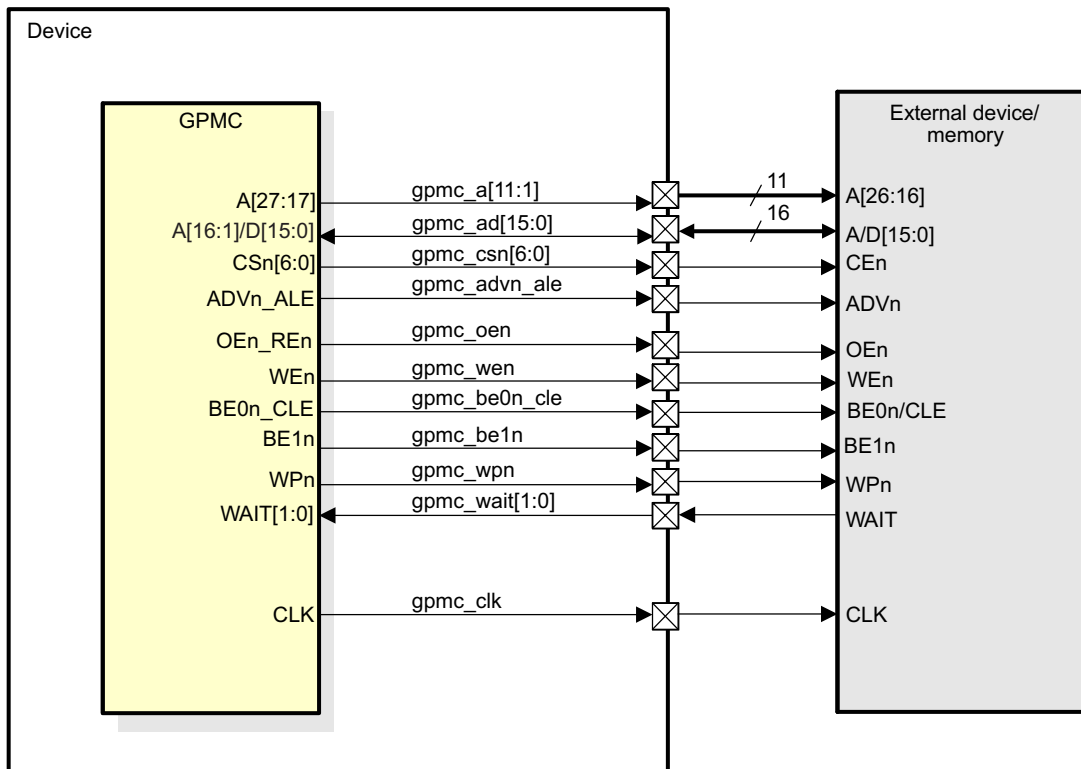

Figure 7-4. GPMC to 16-Bit Non-multiplexed Memory

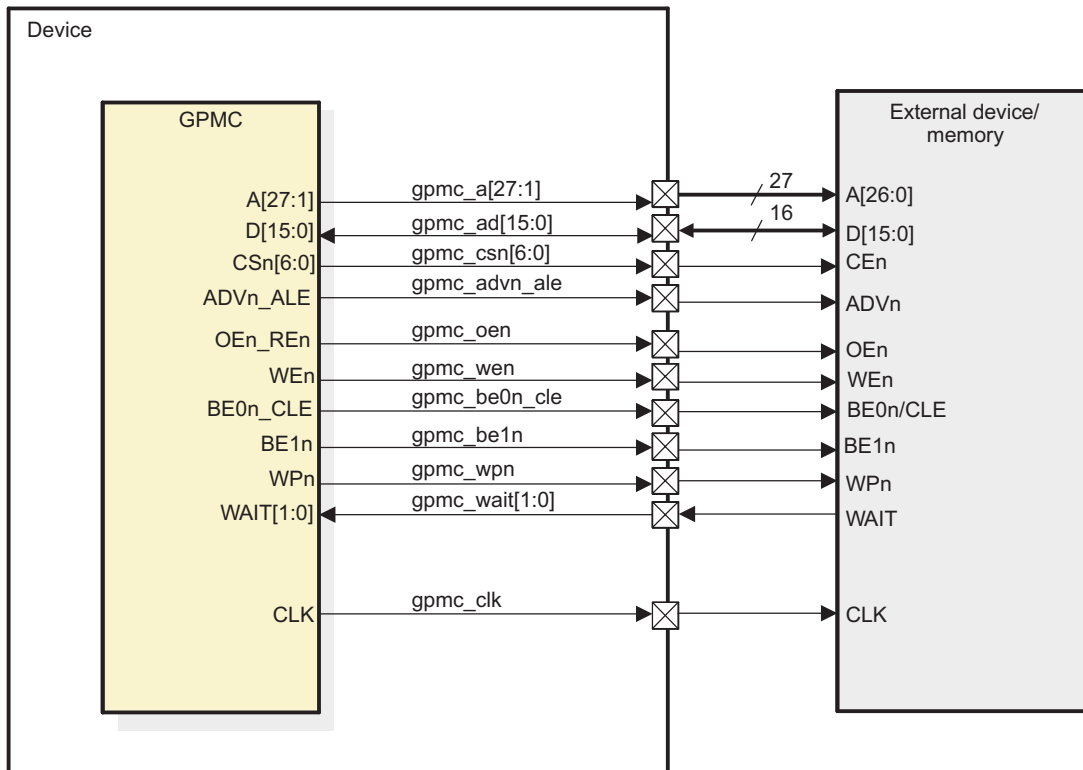

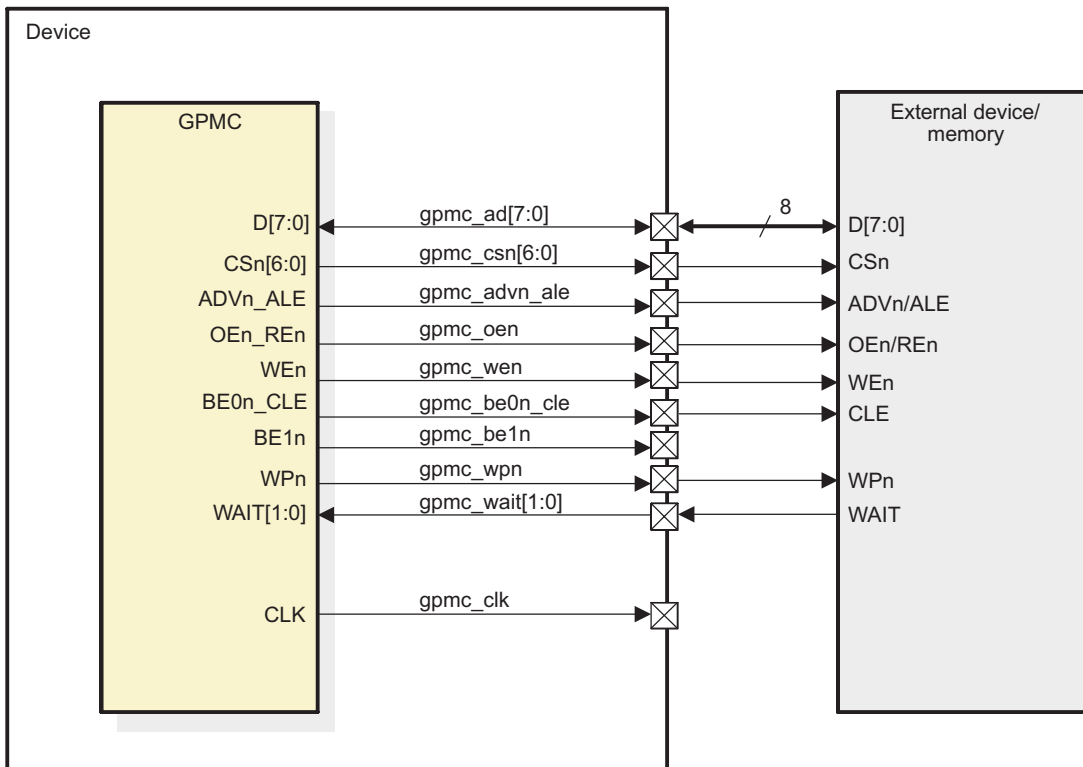

Figure 7-5. GPMC to 8-Bit NAND Device

### 7.1.3.3 GPMC Functional Description

The GPMC basic programming model offers maximum flexibility to support various access protocols for each of the eight configurable chip-selects. Use optimal chip-select settings, based on the characteristics of the external device:

- Different protocols can be selected to support generic asynchronous or synchronous random-access devices (NOR flash, SRAM) or to support specific NAND devices.
- The address and the data bus can be multiplexed on the same external bus.
- Read and write access can be independently defined as asynchronous or synchronous.
- System requests (byte, 16-bit word, burst) are performed through single or multiple accesses. External access profiles (single, multiple with optimized burst length, native- or emulated-wrap) are based on external device characteristics (supported protocol, bus width, data buffer size, native-wrap support).
- System burst read or write requests are synchronous-burst (multiple-read or multiple-write). When neither burst nor page mode is supported by external memory or ASIC devices, system burst read or write requests are translated to successive single synchronous or asynchronous accesses (single reads or single writes). 8-bit wide devices are supported only in single synchronous or single asynchronous read or write mode.
- To simulate a programmable internal-wait state, an external wait pin can be monitored to dynamically control external access at the beginning (initial access time) of and during a burst access.

Each control signal is controlled independently for each chip-select. The internal functional clock of the GPMC (GPMC\_FCLK) is used as a time reference to specify the following:

- Read- and write-access duration
- Most GPMC external interface control-signal assertion and deassertion times
- Data-capture time during read access
- External wait-pin monitoring time
- Duration of idle time between accesses, when required

### 7.1.3.3.1 GPMC Clock Configuration

Table 7-6 describes the GPMC clocks.

**Table 7-6. GPMC Clocks**

Signal	I/O	Description
GPMC_FCLK	I	Functional and interface clock
GPMC_CLK	O	External clock provided to synchronous external memory devices.

The GPMC\_CLK is generated by the GPMC from the internal GPMC\_FCLK clock. The source of the GPMC\_FCLK is described in Table 7-3. The GPMC\_CLK is configured via the GPMC\_CONFIG1\_i[1-0] GPMCFCLKDIVIDER field (for i = 0 to 3) as shown in Table 7-7.

**Table 7-7. GPMC\_CONFIG1\_i Configuration**

Source Clock	GPMC_CONFIG1_i[1-0] GPMCFCLKDIVIDER	GPMC_CLK Generated Clock Provided to External Memory Device
GPMC_FCLK	00	GPMC_FCLK
	01	GPMC_FCLK/2
	10	GPMC_FCLK/3
	11	GPMC_FCLK/4

### 7.1.3.3.2 GPMC Software Reset

The GPMC can be reset by software through the GPMC\_SYSCONFIG[1] SOFTRESET bit. Setting the bit to 1 enables an active software reset that is functionally equivalent to a hardware reset. Hardware and software resets initialize all GPMC registers and the finite state-machine (FSM) immediately and unconditionally. The GPMC\_SYSSTATUS[0] RESETDONE bit indicates that the software reset is complete when its value is 1. The software must ensure that the software reset completes before doing GPMC operations.

### 7.1.3.3.3 GPMC Power Management

GPMC power is supplied by the CORE power domain, and GPMC power management complies with system power-management guidelines. Table 7-8 describes power-management features available for the GPMC module.

**Table 7-8. GPMC Local Power Management Features**

Feature	Registers	Description
Clock Auto Gating	GPMC_SYSCONFIG[0] AUTOIDLE] bit	This bit allows a local power optimization inside the module, by gating the GPMC_FCLK clock upon the internal activity.
Slave Idle Modes	GPMC_SYSCONFIG[4-3] SIDLEMODE bit field	Force-idle, No-idle and Smart-idle wakeup modes are available
Clock Activity	N/A	Feature not available
Master Standby Modes	N/A	Feature not available
Global Wake-up Enable	N/A	Feature not available
Wake-up Sources Enable	N/A	Feature not available

#### 7.1.3.3.4 GPMC Interrupt Requests

The GPMC generates one interrupt event as shown in [Figure 7-2](#).

- The interrupt request goes from GPMC (GPMC\_IRQ) to the Cortex-A8 MPU subsystem: A\_IRQ\_100

[Table 7-9](#) lists the event flags, and their mask, that can cause module interrupts.

**Table 7-9. GPMC Interrupt Events**

Event Flag	Event Mask	Sensitivity	Map to	Description
GPMC_IRQSTATUS[9] WAIT1EDGEDETECTIO NSTATUS	GPMC_IRQENABLE[9] WAIT1EDGEDETECTIO NENABLE	Edge	A_IRQ_100	Wait1 edge detection interrupt: Triggered if a rising or falling edge is detected on the GPMC_WAIT1 signal. The rising or falling edge detection of Wait1 is selected through GPMC_CONFIG[9] WAIT1PINPOLARITY bit.
GPMC_IRQSTATUS[8] WAIT0EDGEDETECTIO NSTATUS	GPMC_IRQENABLE[8] WAIT0EDGEDETECTIO NENABLE	Edge	A_IRQ_100	Wait0 edge detection interrupt: Triggered if a rising or falling edge is detected on the GPMC_WAIT0 signal. The rising or falling edge detection of Wait0 is selected through GPMC_CONFIG[8] WAIT0PINPOLARITY bit.
GPMC_IRQSTATUS[1] TERMINALCOUNTSTAT US	GPMC_IRQENABLE[1] TERMINALCOUNTENA BLE	Level	A_IRQ_100	Terminal count event: Triggered on prefetch process completion, that is when the number of currently remaining data to be requested reaches 0.
GPMC_IRQSTATUS[0] FIFOEVENTSTATUS	GPMC_IRQENABLE[0] FIFOEVENTENABLE	Level	A_IRQ_100	FIFO event interrupt: Indicates FIFO levels availability for in Write-Posting mode and prefetch mode. GPMC_PREFETCH_CONFIG[2] DMAMODE bit shall be cleared to 0.

#### 7.1.3.3.5 GPMC DMA Requests

The GPMC generates one DMA event, from GPMC (GPMC\_DMA\_REQ) to the eDMA: e\_DMA\_53

#### 7.1.3.3.6 L3 Slow Interconnect Interface

The GPMC L3 Slow interconnect interface is a pipelined interface including an 16 × 32-bit word write buffer. Any system host can issue external access requests through the GPMC. The device system can issue the following requests through this interface:

- One 8-bit / 16-bit / 32-bit interconnect access (read/write)
- Two incrementing 32-bit interconnect accesses (read/write)
- Two wrapped 32-bit interconnect accesses (read/write)
- Four incrementing 32-bit interconnect accesses (read/write)
- Four wrapped 32-bit interconnect accesses (read/write)
- Eight incrementing 32-bit interconnect accesses (read/write)
- Eight wrapped 32-bit interconnect accesses (read/write)

Only linear burst transactions are supported; interleaved burst transactions are not supported. Only power-of-two-length precise bursts 2 × 32, 4 × 32, 8 × 32 or 16 × 32 with the burst base address aligned on the total burst size are supported (this limitation applies to incrementing bursts only).

This interface also provides one interrupt and one DMA request line, for specific event control.

It is recommended to program the GPMC\_CONFIG1\_i ATTACHEDDEVICEPAGELENGTH field ([24-23]) according to the effective attached device page length and to enable the GPMC\_CONFIG1\_i WRAPBURST bit ([31]) if the attached device supports wrapping burst. However, it is possible to emulate wrapping burst on a non-wrapping memory by providing relevant addresses within the page or splitting transactions. Bursts larger than the memory page length are chopped into multiple bursts transactions. Due to the alignment requirements, a page boundary is never crossed.

### 7.1.3.3.7 GPMC Address and Data Bus

The current application supports GPMC connection to NAND devices and to address/data-multiplexed memories or devices. Connection to address/data-nonmultiplexed memories Depending on the GPMC configuration of each chip-select, address and data bus lines that are not required for a particular access protocol are not updated (changed from current value) and are not sampled when input (input data bus).

- For address/data-multiplexed and AAD-multiplexed NOR devices, the address is multiplexed on the data bus.
- 8-bit wide NOR devices do not use GPMC I/O: GPMC\_AD[15-8] for data (they are used for address if needed).
- 16-bit wide NAND devices do not use GPMC I/O: GPMC\_A[27-0].
- 8-bit wide NAND devices do not use GPMC I/O: GPMC\_A[27-0] and GPMC I/O: GPMC\_AD[15-8].

#### 7.1.3.3.7.1 GPMC I/O Configuration Setting

---

**NOTE:** In this section and next sections, the *i* in GPMC\_CONFIGx\_i stands for the GPMC chip-select *i* where *i* = 0 to 6.

---

To select a NAND device, program the following register fields:

- GPMC\_CONFIG1\_i[11-10] DEVICETYPE field = 10b
- GPMC\_CONFIG1\_i[9-8] MUXADDDATA bit = 00

To select an address/data-multiplexed device, program the following register fields:

- GPMC\_CONFIG1\_i[11-10] DEVICETYPE field = 00
- GPMC\_CONFIG1\_i[9-8] MUXADDDATA bit = 10b

To select an address/address/data-multiplexed device, program the following register fields:

- GPMC\_CONFIG1\_i[11-10] DEVICETYPE field = 00
- GPMC\_CONFIG1\_i[9-8] MUXADDDATA bit = 01b

To select an address/data-nonmultiplexed device, program the following register fields:

- GPMC\_CONFIG1\_i[11-10] DEVICETYPE field = 00
- GPMC\_CONFIG1\_i[9-8] MUXADDDATA bit = 00

### 7.1.3.3.8 Address Decoder and Chip-Select Configuration

Addresses are decoded accordingly with the address request of the chip-select and the content of the chip-select base address register file, which includes a set of global GPMC configuration registers and eight sets of chip-select configuration registers.

The GPMC configuration register file is memory-mapped and can be read or written with byte, 16-bit word, or 32-bit word accesses. The register file should be configured as a noncacheable, nonbufferable region to prevent any desynchronization between host execution (write request) and the completion of register configuration (write completed with register updated). [Section 7.1.5](#) provides the GPMC register locations. For the map of GPMC memory locations, see [Table 7-54](#).

After the chip-select is configured, the access engine accesses the external device, drives the external interface control signals, and applies the interface protocol based on user-defined timing parameters and settings.

### 7.1.3.3.8.1 Chip-Select Base Address and Region Size

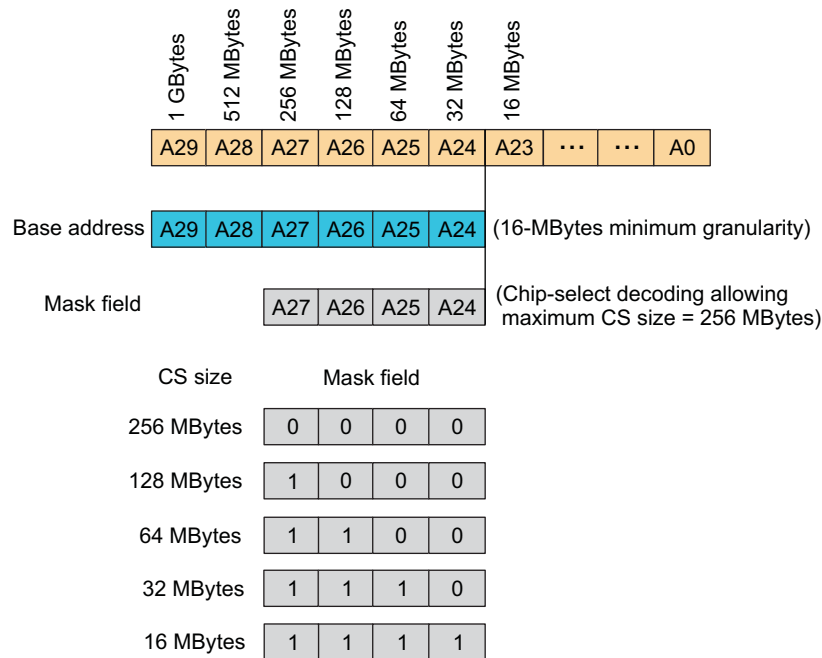

Any external memory or ASIC device attached to the GPMC external interface can be accessed by any device system host within the GPMC 512-Mbyte contiguous address space. For details, see [Table 7-54](#).

The GPMC 512 Mbyte address space can be divided into a maximum of seven chip-select regions with programmable base address and programmable CS size. The CS size is programmable from 16 Mbytes to 256 Mbytes (must be a power-of-2) and is defined by the mask field. Attached memory smaller than the programmed CS region size is accessed through the entire CS region (aliasing).

Each chip-select has a 6-bit base address encoding and a 4-bit decoding mask, which must be programmed according to the following rules:

- The programmed chip-select region base address must be aligned on the chip-select region size address boundary and is limited to a power-of-2 address value. During access decoding, the register base address value is used for address comparison with the address-bit line mapping as described in [Figure 7-6](#) (with A0 as the device system byte-address line). Base address is programmed through the GPMC\_CONFIG7\_i[5-0] BASEADDRESS bit field.
- The register mask is used to exclude some address lines from the decoding. A register mask bit field cleared to 0 suppresses the associated address line from the address comparison (incoming address bit line is don't care). The register mask value must be limited to the subsequent value, based on the desired chip-select region size. Any other value has an undefined result. When multiple chip-select regions with overlapping addresses are enabled concurrently, access to these chip-select regions is cancelled and a GPMC access error is posted. The mask field is programmed through the GPMC\_CONFIG7\_i[11-8] MASKADDRESS bit field.

**Figure 7-6. Chip-Select Address Mapping and Decoding Mask**

A mask value of 0010 or 1001 must be avoided because it will create holes in the chip-select address space.

Chip-select configuration (base and mask address or any protocol and timing settings) must be performed while the associated chip-select is disabled through the GPMC\_CONFIG7\_i[6] CSVALID bit. In addition, a chip-select configuration can only be disabled if there is no ongoing access to that chip-select. This requires activity monitoring of the prefetch or write-posting engine if the engine is active on the chip-select. Also, the write buffer state must be monitored to wait for any posted write completion to the chip-select.

Any access attempted to a nonvalid GPMC address region (CSVVALID disabled or address decoding outside a valid chip-select region) is not propagated to the external interface and a GPMC access error is posted. In case of chip-selects overlapping, an error is generated and no access will occur on either chip-select. Chip-select 0 is the only chip-select region enabled after either a power-up or a GPMC reset.

Although the GPMC interface can drive up to seven chip-selects, the frequency specified for this interface is for a specific load. If this load is exceeded, the maximum frequency cannot be reached. One solution is to implement a board with buffers, to allow the slowest device to maintain the total load on the lines.

### 7.1.3.3.8.2 Access Protocol

#### 7.1.3.3.8.2.1 Supported Devices

The access protocol of each chip-select can be independently specified through the GPMC\_CONFIG1\_i[11-10] DEVICETYPE parameter for:

- Random-access synchronous or asynchronous memory like NOR flash, SRAM
- NAND flash asynchronous devices

For more information about the NAND flash GPMC basic programming model and NAND support, see [Section 7.1.3.3.12](#) and [Section 7.1.3.3.12.1](#).

#### 7.1.3.3.8.2.2 Access Size Adaptation and Device Width

Each chip-select can be independently configured through the GPMC\_CONFIG1\_i[13-12] DEVICESIZE field to interface with a 16-bit wide device or an 8-bit wide device. System requests with data width greater than the external device data bus width are split into successive accesses according to both the external device data-bus width and little-endian data organization.

An 8-bit wide device must be interfaced to the D0-D7 external interface bus lane. GPMC data accesses only use this bus lane when the associated chip-select is attached to an 8-bit wide device.

The 8-bit wide device can be interfaced in asynchronous or synchronous mode in single data phase (no 8-bit wide device burst mode). If the 8-bit wide device is set in the chip-select configuration register, ReadMultiple and WriteMultiple bit fields are considered “don't care” and only single accesses are performed.

A 16-bit wide device can be interfaced in asynchronous or synchronous mode, with single or multiple data phases for an access, and with native or emulated wrap mode support.

#### 7.1.3.3.8.2.3 Address/Data-Multiplexing Interface

For random synchronous or asynchronous memory interfacing (DEVICETYPE = 0b00), an address- and data-multiplexing protocol can be selected through the GPMC\_CONFIG1\_i[9-8] MUXADDDATA bit field. The ADVn signal must be used as the external device address latch control signal. For the associated chip-select configuration, ADVn assertion and deassertion time and OEn assertion time must be set to the appropriate value to meet the address latch setup/hold time requirements of the external device (see [Section 7.1.2](#)).

This address/data-multiplexing interface is not applicable to NAND device interfacing. NAND devices require a specific address, command, and data multiplexing protocol (see [Section 7.1.3.3.12](#)).

### 7.1.3.3.8.3 External Signals

#### 7.1.3.3.8.3.1 WAIT Pin Monitoring Control

GPMC access time can be dynamically controlled using an external gpmc\_wait pin when the external device access time is not deterministic and cannot be defined and controlled only using the GPMC internal RDACCESSTIME, WRACCESSTIME and PAGEBURSTACCESSTIME wait state generator.

The GPMC features two input wait pin:gpmc\_wait1, and gpmc\_wait0. This pin allow control of external devices with different wait-pin polarity. They also allow the overlap of wait-pin assertion from different devices without affecting access to devices for which the wait pin is not asserted.

- The GPMC\_CONFIG1\_i[17-16] WAITPINSELECT bit field (where i = 0 to 6) selects which input gpmc\_wait pin is used for the device attached to the corresponding chip-select.
- The polarity of the wait pin is defined through the WAITxPINPOLARITY bit of the GPMC\_CONFIG register. A wait pin configured to be active low means that low level on the WAIT signal indicates that the data is not ready and that the data bus is invalid. When WAIT is inactive, data is valid.

The GPMC access engine can be configured per CS to monitor the wait pin of the external memory device or not, based on the access type: read or write.

- The GPMC\_CONFIG1\_i[22] WAITREADMONITORING bit defines whether the wait pin should be monitored during read accesses or not.
- The GPMC\_CONFIG1\_i[21] WAITWRITEMONITORING bit defines whether the wait pin should be monitored during write accesses or not.

The GPMC access engine can be configured to monitor the wait pin of the external memory device asynchronously or synchronously with the GPMC\_CLK clock, depending on the access type: synchronous or asynchronous (the GPMC\_CONFIG1\_i[29] READTYPE and GPMC\_CONFIG1\_i[27] WRITETYPE bits).

#### 7.1.3.3.8.3.2 Wait Monitoring During an Asynchronous Read Access

When wait-pin monitoring is enabled for read accesses (WAITREADMONITORING), the effective access time is a logical AND combination of the RDACCESSTIME timing completion and the wait-deasserted state.

During asynchronous read accesses with wait-pin monitoring enabled, the wait pin must be at a valid level (asserted or deasserted) for at least two GPMC clock cycles before RDACCESSTIME completes, to ensure correct dynamic access-time control through wait-pin monitoring. The advance pipelining of the two GPMC clock cycles is the result of the internal synchronization requirements for the WAIT signal.

In this context, RDACCESSTIME is used as a WAIT invalid timing window and is set to such a value that the wait pin is at a valid state two GPMC clock cycles before RDACCESSTIME completes.

Similarly, during a multiple-access cycle (for example, asynchronous read page mode), the effective access time is a logical AND combination of PAGEBURSTACCESSTIME timing completion and the wait-deasserted state. Wait-monitoring pipelining is also applicable to multiple accesses (access within a page).

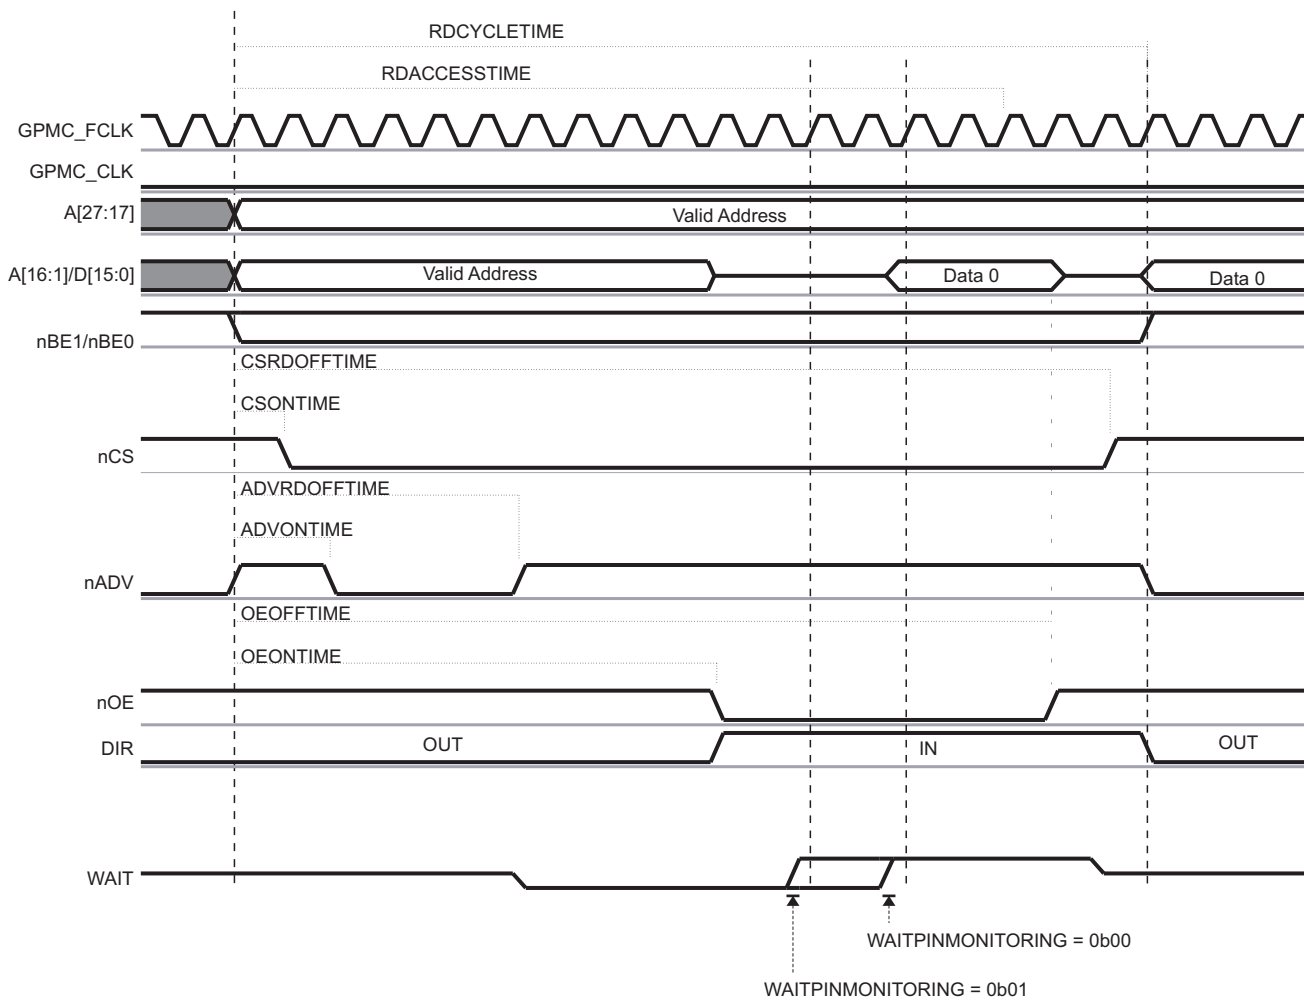

- WAIT monitored as active freezes the CYCLETIME counter. For an access within a page, when the CYCLETIME counter is by definition in a lock state, WAIT monitored as asserted extends the current access time in the page. Control signals are kept in their current state. The data bus is considered invalid, and no data are captured during this clock cycle.
- WAIT monitored as inactive unfreezes the CYCLETIME counter. For an access within a page, when the CYCLETIME counter is by definition in a lock state, WAIT monitored as inactive completes the current access time and starts the next access phase in the page. The data bus is considered valid, and data are captured during this clock cycle. In case of a single access or if this was the last access in a multiple-access cycle, all signals are controlled according to their related control timing value and according to the CYCLETIME counter status.

When a delay larger than two GPMC clocks must be observed between wait-pin deactivation time and data valid time (including the required GPMC and the device data setup time), an extra delay can be added between wait-pin deassertion time detection and effective data-capture time and the effective unlock of the CYCLETIME counter. This extra delay can be programmed in the GPMC\_CONFIG1\_i[19-18] WAITMONITORINGTIME field.

- The WAITMONITORINGTIME parameter does not delay the wait-pin active or inactive detection, nor does it modify the two GPMC clocks pipelined detection delay.
- This extra delay is expressed as a number of GPMC\_CLK clock cycles, even though the access is defined as asynchronous, and no GPMC\_CLK clock is provided to the external device. Still, GPMCFCLKDIVIDER is used as a divider for the GPMC clock, so it must be programmed to define the correct WAITMONITORINGTIME delay.

Figure 7-7 shows wait behavior during an asynchronous single read access.

**Figure 7-7. Wait Behavior During an Asynchronous Single Read Access (GPMCFCLKDivider = 1)**

The WAIT signal is active low. GPMC\_CONFIG1\_i[19-18] WAITMONITORINGTIME = 00b or 01b.

### 7.1.3.3.3.3 Wait Monitoring During an Asynchronous Write Access

When wait-pin monitoring is enabled for write accesses (GPMC\_CONFIG1\_i[21] WAITWRITEMONITORING bit = 1), the WAIT-invalid timing window is defined by the WRACCESSTIME field. WRACCESSTIME must be set so that the wait pin is at a valid state two GPMC clock cycles before WRACCESSTIME completes. The advance pipelining of the two GPMC clock cycles is the result of the internal synchronization requirements for the WAIT signal.

- WAIT monitored as active freezes the CYCLETIME counter. This informs the GPMC that the data bus is not captured by the external device. The control signals are kept in their current state. The data bus still drives the data.
- WAIT monitored as inactive unfreezes the CYCLETIME counter. This informs that the data bus is correctly captured by the external device. All signals, including the data bus, are controlled according to their related control timing value and to the CYCLETIME counter status.

When a delay larger than two GPMC clock cycles must be observed between wait-pin deassertion time and the effective data write into the external device (including the required GPMC data setup time and the device data setup time), an extra delay can be added between wait-pin deassertion time detection and effective data write time into the external device and the effective unfreezing of the CYCLETIME counter. This extra delay can be programmed in the GPMC\_CONFIG1\_i[19-18] WAITMONITORINGTIME fields.

- The WAITMONITORINGTIME parameter does not delay the wait-pin assertion or deassertion detection, nor does it modify the two GPMC clock cycles pipelined detection delay.
- This extra delay is expressed as a number of GPMC\_CLK clock cycles, even though the access is defined as asynchronous, and even though no clock is provided to the external device. Still, GPMC\_CONFIG1\_i[1-0] GPMCFCLKDIVIDER is used as a divider for the GPMC clock and so it must be programmed to define the correct WAITMONITORINGTIME delay.

#### 7.1.3.3.8.3.4 Wait Monitoring During a Synchronous Read Access

During synchronous accesses with wait-pin monitoring enabled, the wait pin is captured synchronously with GPMC\_CLK, using the rising edge of this clock.

The WAIT signal can be programmed to apply to the same clock cycle it is captured in. Alternatively, it can be sampled one or two GPMC\_CLK cycles ahead of the clock cycle it applies to. This pipelining is applicable to the entire burst access, and to all data phase in the burst access. This WAIT pipelining depth is programmed in the GPMC\_CONFIG1\_i[19-18] WAITMONITORINGTIME field, and is expressed as a number of GPMC\_CLK clock cycles.

In synchronous mode, when wait-pin monitoring is enabled (GPMC\_CONFIG1\_i[22] WAITREADMONITORING bit), the effective access time is a logical AND combination of the RDACCESSTIME timing completion and the WAIT deasserted-state detection.

Depending on the programmed WAITMONITORINGTIME value, the wait pin should be at a valid level, either asserted or deasserted:

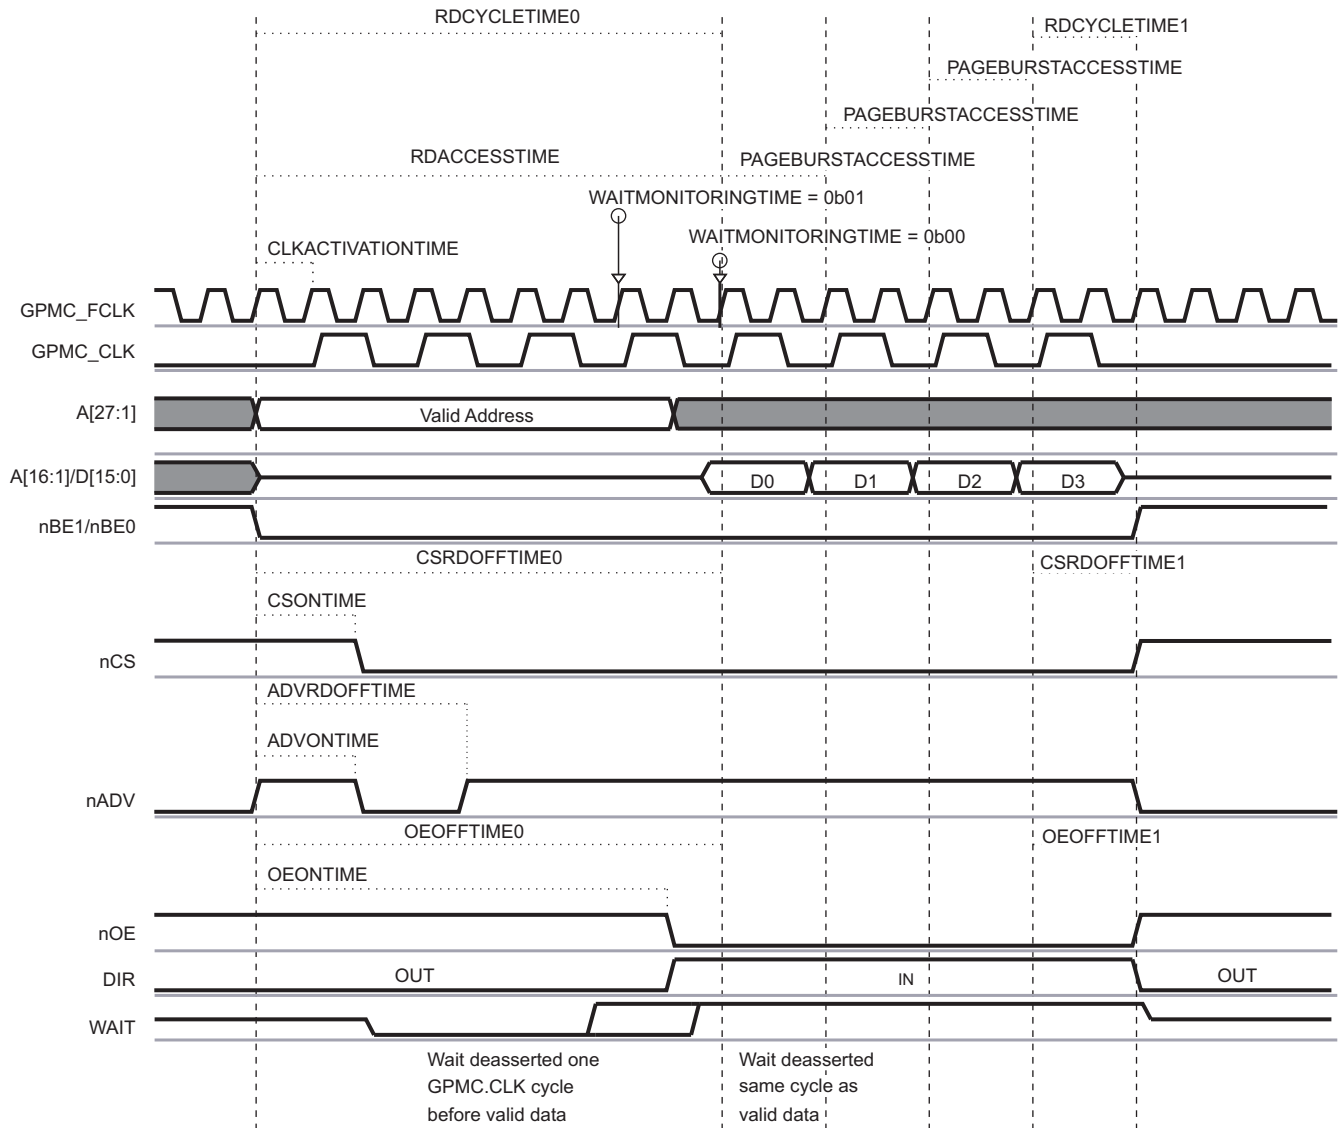

- In the same clock cycle the data is valid if WAITMONITORINGTIME = 0 ( at RDACCESSTIME completion)
- In the WAITMONITORINGTIME x (GPMCFCLKDIVIDER + 1) GPMC\_FCLK clock cycles before RDACCESSTIME completion if WAITMONITORINGTIME not equal to 0

Similarly, during a multiple-access cycle (burst mode), the effective access time is a logical AND combination of PAGEBURSTACCESSTIME timing completion and the wait-inactive state. The Wait pipelining depth programming applies to the whole burst access.

- WAIT monitored as active freezes the CYCLETIME counter. For an access within a burst (when the CYCLETIME counter is by definition in a lock state), WAIT monitored as active extends the current access time in the burst. Control signals are kept in their current state. The data bus is considered invalid, and no data are captured during this clock cycle.
- WAIT monitored as inactive unfreezes the CYCLETIME counter. For an access within a burst (when the CYCLETIME counter is by definition in lock state), WAIT monitored as inactive completes the current access time and starts the next access phase in the burst. The data bus is considered valid, and data are captured during this clock cycle. In a single access or if this was the last access in a multiple-access cycle, all signals are controlled according to their relative control timing value and the CYCLETIME counter status.

Figure 7-8 shows wait behavior during a synchronous read burst access.

**Figure 7-8. Wait Behavior During a Synchronous Read Burst Access**

The WAIT signal is active low. WAITMONITORINGTIME = 00b or 01b.

**7.1.3.3.8.3.5 Wait Monitoring During a Synchronous Write Access**

During synchronous accesses with wait-pin monitoring enabled (the WAITWRITEMONITORING bit), the wait pin is captured synchronously with GPMC\_CLK, using the rising edge of this clock.

If enabled, external wait-pin monitoring can be used in combination with WRACCESSTIME to delay the effective memory device GPMC\_CLK capture edge.

Wait-monitoring pipelining depth is similar to synchronous read access:

- At WRACCESSTIME completion if WAITMONITORINGTIME = 0
- In the WAITMONITORINGTIME x (GPMCFCLKDIVIDER + 1) GPMC\_FCLK cycles before WRACCESSTIME completion if WAITMONITORINGTIME not equal to 0.

Wait-monitoring pipelining definition applies to whole burst accesses:

- WAIT monitored as active freezes the CYCLETIME counter. For accesses within a burst, when the CYCLETIME counter is by definition in a lock state, WAIT monitored as active indicates that the data bus is not being captured by the external device. Control signals are kept in their current state. The data bus is kept in its current state.
- WAIT monitored as inactive unfreezes the CYCLETIME counter. For accesses within a burst, when the CYCLETIME counter is by definition in a lock state, WAIT monitored as inactive indicates the effective data capture of the bus by the external device and starts the next access of the burst. In case of a single access or if this was the last access in a multiple access cycle, all signals, including the data bus, are controlled according to their related control timing value and the CYCLETIME counter status.

Wait monitoring is supported for all configurations except for GPMC\_CONFIG1\_i[19-18]  
WAITMONITORINGTIME = 0 for write bursts with a clock divider of 1 or 2 (GPMC\_CONFIG1\_i[1-0]  
GPMCFCLKDIVIDER field equal to 0 or 1, respectively).

#### 7.1.3.3.8.3.6 *WAIT With NAND Device*

For details about the use of the wait pin for communication with a NAND flash external device, see [Section 7.1.3.3.12.2](#).

#### 7.1.3.3.8.3.7 *Idle Cycle Control Between Successive Accesses*

##### 7.1.3.3.8.3.7.1 *Bus Turnaround (BUSTURNAROUND)*

To prevent data-bus contention, an access that follows a read access to a slow memory/device must be delayed (in other words, control the CSn/OEn de-assertion to data bus in high-impedance delay).

The bus turnaround is a time-out counter starting after CSn or OEn de-assertion time, whichever occurs first, and delays the next access start-cycle time. The counter is programmed through the GPMC\_CONFIG6\_i[3-0] BUSTURNAROUND bit field.

After a read access to a chip-select with a non zero BUSTURNAROUND, the next access is delayed until the BUSTURNAROUND delay completes, if the next access is one of the following:

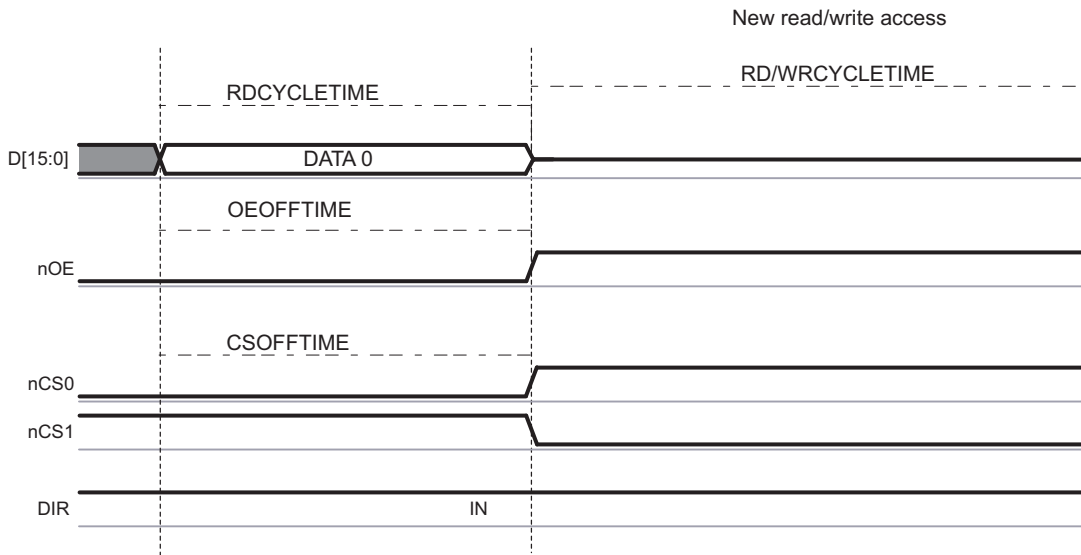

- A write access to any chip-select (same or different from the chip-select data was read from)
- A read access to a different chip-select from the chip-select data was read access from
- A read or write access to a chip-select associated with an address/data-multiplexed device

Bus keeping starts after bus turnaround completion so that DIR changes from IN to OUT after bus turnaround. The bus will not have enough time to go into high-impedance even though it could be driven with the same value before bus turnaround timing.

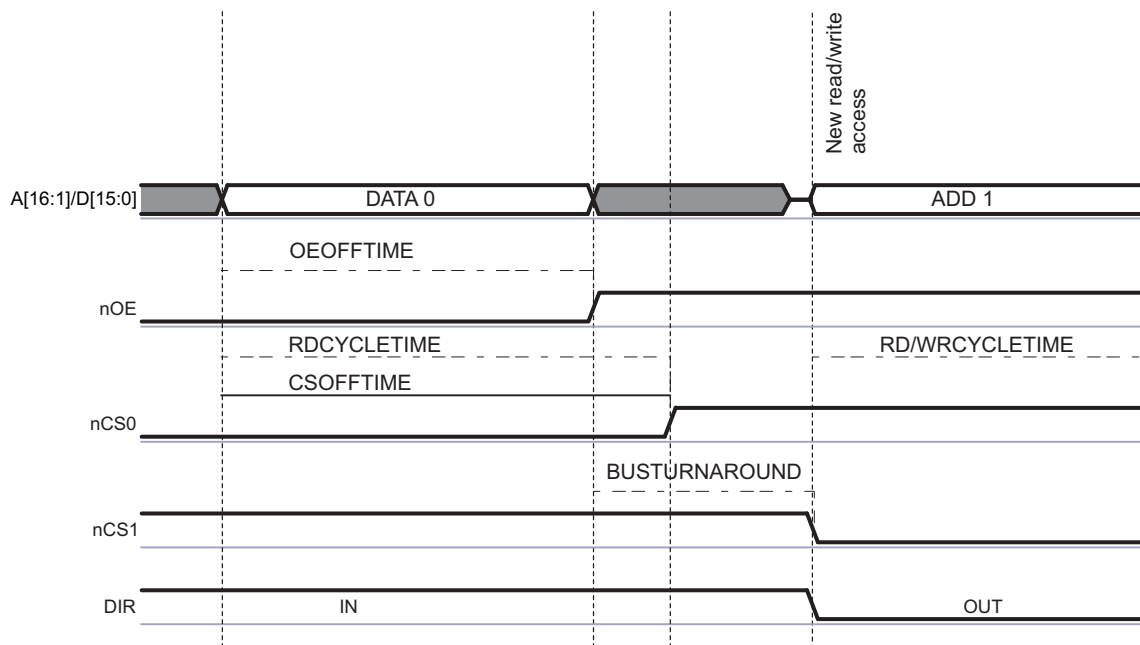

BUSTURNAROUND delay runs in parallel with GPMC\_CONFIG6\_i[3-0] CYCLE2CYCLEDELAY delays. It should be noted that BUSTURNAROUND is a timing parameter for the ending chip-select access while CYCLE2CYCLEDELAY is a timing parameter for the following chip-select access. The effective minimum delay between successive accesses is driven by these delay timing parameters and by the access type of the following access. See [Figure 7-9](#) to [Figure 7-11](#).

Another way to prevent bus contention is to define an earlier CSn or OEn deassertion time for slow devices or to extend the value of RDCYCLETIME. Doing this prevents bus contention, but affects all accesses of this specific chip-select.

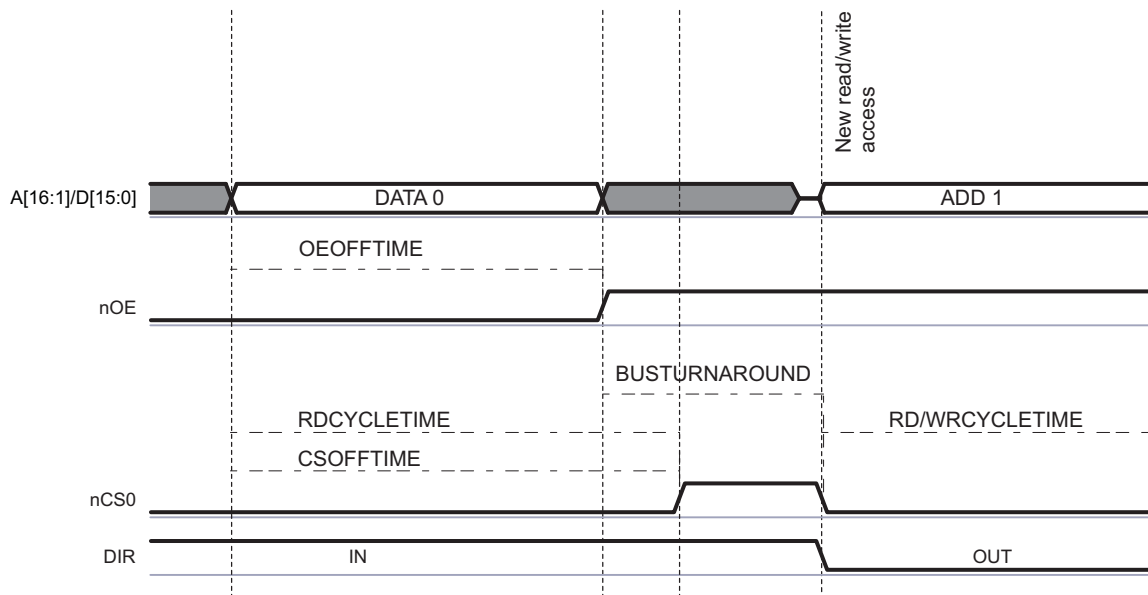

**Figure 7-9. Read to Read for an Address-Data Multiplexed Device, On Different CS, Without Bus Turnaround (CS0n Attached to Fast Device)**

**Figure 7-10. Read to Read / Write for an Address-Data Multiplexed Device, On Different CS, With Bus Turnaround**

**Figure 7-11. Read to Read / Write for a Address-Data or AAD-Multiplexed Device, On Same CS, With Bus Turnaround**

#### 7.1.3.3.8.3.7.2 Idle Cycles Between Accesses to Same Chip-Select (*CYCLE2CYCLESAMECSSEN*, *CYCLE2CYCLEDELAY*)

Some devices require a minimum chip-select signal inactive time between accesses. The GPMC\_CONFIG6\_i[7] CYCLE2CYCLESAMECSSEN bit enables insertion of a minimum number of GPMC\_FCLK cycles, defined by the GPMC\_CONFIG6\_i[11-8] CYCLE2CYCLEDELAY field, between successive accesses of any type (read or write) to the same chip-select.

If CYCLE2CYCLESAMECSSEN is enabled, any subsequent access to the same chip-select is delayed until its CYCLE2CYCLEDELAY completes. The CYCLE2CYCLEDELAY counter starts when CSRDOFFTIME/CSWROFFTIME completes.

The same applies to successive accesses occurring during 32-bit word or burst accesses split into successive single accesses when the single-access mode is used (GPMC\_CONFIG1\_i[30] READMULTIPLE = 0 or GPMC\_CONFIG1\_i[28] WRITEMULTIPLE = 0).

All control signals are kept in their default states during these idle GPMC\_FCLK cycles. This prevents back-to-back accesses to the same chip-select without idle cycles between accesses.

#### 7.1.3.3.8.3.7.3 Idle Cycles Between Accesses to Different Chip-Select (*CYCLE2CYCLEDIFFCSSEN*, *CYCLE2CYCLEDELAY*)

Because of the pipelined behavior of the system, successive accesses to different chip-selects can occur back-to-back with no idle cycles between accesses. Depending on the control signals (CSn, ADV\_ALEn, BE0\_CLEn, OE\_REn, WEn) assertion and de-assertion timing parameters and on the IC timing parameters, some control signals assertion times may overlap between the successive accesses to different CS. Similarly, some control signals (WEn, OE\_REn) may not respect required transition times.

To work around the overlapping and to observe the required control-signal transitions, a minimum of CYCLE2CYCLEDELAY inactive cycles is inserted between the access being initiated to this chip-select and the previous access ending for a different chip-select. This applies to any type of access (read or write).

If GPMC\_CONFIG6\_i[6] CYCLE2CYCLEDIFFCSEN is enabled, the chip-select access is delayed until CYCLE2CYCLEDELAY cycles have expired since the end of a previous access to a different chip-select. CYCLE2CYCLEDELAY count starts at CSRDOFFTIME/CSWROFFTIME completion. All control signals are kept inactive during the idle GPMC\_FCLK cycles.

CYCLE2CYCLESAMECSEN and CYCLE2CYCLEDIFFCSEN should be set in registers to respectively get idle cycles inserted between accesses on this chip-select and after accesses to a different chip-select.

The CYCLE2CYCLEDELAY delay runs in parallel with the BUSTURNAROUND delay. It should be noted that BUSTURNAROUND is a timing parameter defined for the ending chip-select access, whereas CYCLE2CYCLEDELAY is a timing parameter defined for the starting chip-select access. The effective minimum delay between successive accesses is based on the larger delay timing parameter and on access type combination, since bus turnaround does not apply to all access types. See [Section 7.1.3.3.8.3.7.1](#) for more details on bus turnaround.

[Table 7-10](#) describes the configuration required for idle cycle insertion.

**Table 7-10. Idle Cycle Insertion Configuration**

First Access Type	BUSTURN AROUND Timing Parameter	Second Access Type	Chip-Select	Addr/Data Multiplexed	CYCLE2 CYCLE SAMECSEN Parameter	CYCLE2 CYCLE DIFFCSEN Parameter	Idle Cycle Insertion Between the Two Accesses
R/W	0	R/W	Any	Any	0	x	No idle cycles are inserted if the two accesses are well pipelined.
R	>0	R	Same	Nonmuxed	x	0	No idle cycles are inserted if the two accesses are well pipelined.
R	>0	R	Different	Nonmuxed	0	0	BUSTURNAROUND cycles are inserted.
R	>0	R/W	Any	Muxed	0	0	BUSTURNAROUND cycles are inserted.
R	>0	W	Any	Any	0	0	BUSTURNAROUND cycles are inserted.
W	>0	R/W	Any	Any	0	0	No idle cycles are inserted if the two accesses are well pipelined.
R/W	0	R/W	Same	Any	1	x	CYCLE2CYCLEDELAY cycles are inserted.
R/W	0	R/W	Different	Any	x	1	CYCLE2CYCLEDELAY cycles are inserted.
R/W	>0	R/W	Same	Any	1	x	CYCLE2CYCLEDELAY cycles are inserted. If BTA idle cycles already apply on these two back-to-back accesses, the effective delay is max (BUSTURNAROUND, CYCLE2CYCLEDELAY).
R/W	>0	R/W	Different	Any	x	1	CYCLE2CYCLEDELAY cycles are inserted. If BTA idle cycles already apply on these two back-to-back accesses, the effective delay is maximum (BUSTURNAROUND, CYCLE2CYCLEDELAY).

#### 7.1.3.3.8.3.8 Slow Device Support (TIMEPARAGRANULARITY Parameter)

All access-timing parameters can be multiplied by 2 by setting the GPMC\_CONFIG1\_i[4] TIMEPARAGRANULARITY bit. Increasing all access timing parameters allows support of slow devices.

#### 7.1.3.3.8.3.9 GPMC\_DIR Pin

The GPMC\_DIR pin is used to control I/O direction on the GPMC data bus GPMC\_D[15-0]. Depending on top-level pad multiplexing, this signal can be output and used externally to the device, if required. The GPMC\_DIR pin is low during transmit (OUT) and high during receive (IN).

For write accesses, the GPMC\_DIR pin stays OUT from start-cycle time to end-cycle time.

For read accesses, the GPMC\_DIR pin goes from OUT to IN at OEn assertion time and stays IN until:

- BUSTURNAROUND is enabled
  - The GPMC\_DIR pin goes from IN to OUT at end-cycle time plus programmable bus turnaround time.
- BUSTURNAROUND is disabled
  - After an asynchronous read access, the GPMC\_DIR pin goes from IN to OUT at RDACCESSTIME + 1 GPMC\_FCLK cycle or when RDCYCLETIME completes, whichever occurs last.
  - After a synchronous read access, the GPMC\_DIR pin goes from IN to OUT at RDACCESSTIME + 2 GPMC\_FCLK cycles or when RDCYCLETIME completes, whichever occurs last.

Because of the bus-keeping feature of the GPMC, after a read or write access and with no other accesses pending, the default value of the GPMC\_DIR pin is OUT (see [Section 7.1.3.3.9.10](#)). In nonmultiplexed devices, the GPMC\_DIR pin stays IN between two successive read accesses to prevent unnecessary toggling.

#### 7.1.3.3.8.3.10 Reset

No reset signal is sent to the external memory device by the GPMC. For more information about external-device reset, see [Chapter 8, Power, Reset, and Clock Management \(PRCM\)](#).

The PRCM module provides an input pin, global\_rst\_n, to the GPMC:

- The global\_rst\_n pin is activated during device warm reset and cold reset.
- The global\_rst\_n pin initializes the internal state-machine and the internal configuration registers.

#### 7.1.3.3.8.3.11 Write Protect Signal (WPn)

When connected to the attached memory device, the write protect signal can enable or disable the lockdown function of the attached memory. The GPMC\_WPn output pin value is controlled through the GPMC\_CONFIG[4] WRITEPROTECT bit, which is common to all CS.

#### 7.1.3.3.8.3.12 Byte Enable (BE1n/BE0n)

Byte enable signals (BE1n/BE0n) are:

- Valid (asserted or nonasserted according to the incoming system request) from access start to access completion for asynchronous and synchronous single accesses
- Asserted low from access start to access completion for asynchronous and synchronous multiple read accesses
- Valid (asserted or nonasserted, according to the incoming system request) synchronously to each written data for synchronous multiple write accesses

#### 7.1.3.3.8.4 Error Handling

When an error occurs in the GPMC, the error information is stored in the GPMC\_ERR\_TYPE register and the address of the illegal access is stored in the GPMC\_ERR\_ADDRESS register. The GPMC keeps only the first error abort information until the GPMC\_ERR\_TYPE register is reset. Subsequent accesses that cause errors are not logged until the error is cleared by hardware with the GPMC\_ERR\_TYPE[0]ERRORVALID bit.

- **ERRORNOTSUPPADD** occurs when an incoming system request address decoding does not match any valid chip-select region, or if two chip-select regions are defined as overlapped, or if a register file access is tried outside the valid address range of 1KB.
- **ERRORNOTSUPPMCMD** occurs when an unsupported command request is decoded at the L3 Slow interconnect interface
- **ERRORTIMEOUT**: A time-out mechanism prevents the system from hanging. The start value of the 9-bit time-out counter is defined in the GPMC\_TIMEOUT\_CONTROL register and enabled with the GPMC\_TIMEOUT\_CONTROL[0] TIMEOUTENABLE bit. When enabled, the counter starts at start-cycle time until it reaches 0 and data is not responded to from memory, and then a time-out error occurs. When data are sent from memory, this counter is reset to its start value. With multiple accesses (asynchronous page mode or synchronous burst mode), the counter is reset to its start value for each data access within the burst.

The GPMC does not generate interrupts on these errors. True abort to the MPU or interrupt generation is handled at the interconnect level.

### 7.1.3.3.9 Timing Setting

The GPMC offers the maximum flexibility to support various access protocols. Most of the timing parameters of the protocol access used by the GPMC to communicate with attached memories or devices are programmable on a chip-select basis. Assertion and deassertion times of control signals are defined to match the attached memory or device timing specifications and to get maximum performance during accesses. For more information on GPMC\_CLK and GPMC\_FCLK see [Section 7.1.3.3.9.6](#).

In the following sections, the start access time refer to the time at which the access begins.

#### 7.1.3.3.9.1 Read Cycle Time and Write Cycle Time (RDCYCLETIME / WRCYCLETIME)

The GPMC\_CONFIG5\_i[4-0] RDCYCLETIME and GPMC\_CONFIG5\_i[12-8] WRCYCLETIME fields define the address bus and byte enables valid times for read and write accesses. To ensure a correct duty cycle of GPMC\_CLK between accesses, RDCYCLETIME and WRCYCLETIME are expressed in GPMC\_FCLK cycles and must be multiples of the GPMC\_CLK cycle. RDCYCLETIME and WRCYCLETIME bit fields can be set with a granularity of 1 or 2 through GPMC\_CONFIG1\_i[4] TIMEPARAGRANULARITY.

When either RDCYCLETIME or WRCYCLETIME completes, if they are not already deasserted, all control signals (CSn, ADV\_ALEn, OE\_REn, WEn, and BE0\_CLEn) are deasserted to their reset values, regardless of their deassertion time parameters.

An exception to this forced deassertion occurs when a pipelined request to the same chip-select or to a different chip-select is pending. In such a case, it is not necessary to deassert a control signal with deassertion time parameters equal to the cycle-time parameter. This exception to forced deassertion prevents any unnecessary glitches. This requirement also applies to BE signals, thus avoiding an unnecessary BE glitch transition when pipelining requests.

If no inactive cycles are required between successive accesses to the same or to a different chip-select (GPMC\_CONFIG6\_i[7] CYCLE2CYCLESAMECSEN = 0 or GPMC\_CONFIG6\_i[6] CYCLE2CYCLEDIFFCSEN = 0, where i = 0 to 3), and if assertion-time parameters associated with the pipelined access are equal to 0, asserted control signals (CSn, ADV\_ALEn, BE0\_CLEn, WEn, and OE\_REn) are kept asserted. This applies to any read/write to read/write access combination.

If inactive cycles are inserted between successive accesses, that is, CYCLE2CYCLESAMECSEN = 1 or CYCLE2CYCLEDIFFCSEN = 1, the control signals are forced to their respective default reset values for the number of GPMC\_FCLK cycles defined in CYCLE2CYCLEDELAY.

#### 7.1.3.3.9.2 CSn: Chip-Select Signal Control Assertion/Deassertion Time (CSONTIME / CSRDOFFTIME / CSWROFFTIME / CSEXTRADELAY)

The GPMC\_CONFIG2\_i[3-0] CSONTIME field defines the CSn signal-assertion time relative to the start access time. It is common for read and write accesses.

The GPMC\_CONFIG2\_i[12-8] CSRDOFFTIME (read access) and GPMC\_CONFIG2\_i[20-16] CSWROFFTIME (write access) bit fields define the CSn signal deassertion time relative to start access time.

CSONTIME, CSRDOFFTIME and CSWROFFTIME parameters are applicable to synchronous and asynchronous modes. CSONTIME can be used to control an address and byte enable setup time before chip-select assertion. CSRDOFFTIME and CSWROFFTIME can be used to control an address and byte enable hold time after chip-select deassertion.

CSn signal transitions as controlled through CSONTIME, CSRDOFFTIME, and CSWROFFTIME can be delayed by half a GPMC\_FCLK period by enabling the GPMC\_CONFIG2\_i[7] CSEXTRADELAY bit. This half of a GPMC\_FCLK period provides more granularity on the CSn assertion and deassertion time to guarantee proper setup and hold time relative to GPMC\_CLK. CSEXTRADELAY is especially useful in configurations where GPMC\_CLK and GPMC\_FCLK have the same frequency, but can be used for all GPMC configurations. If enabled, CSEXTRADELAY applies to all parameters controlling CSn transitions.

The CSEXTRADELAY bit must be used carefully to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program the RDCYCLETIME and WRCYCLETIME bit fields to be greater than the CSn signal-deassertion time, including the extra half-GPMC\_FCLK-period delay.

#### **7.1.3.3.9.3 ADVn/ALE: Address Valid/Address Latch Enable Signal Control Assertion/Deassertion Time (ADVONTIME / ADVRDOFFTIME / ADVWROFFTIME / ADVEXTRADELAY/ADVAADMUXONTIME/ADVAADMUXRDOFFTIME/ADVAADMUXWROFFTIME )**

The GPMC\_CONFIG3\_i[3-0] ADVONTIME field defines the ADVn\_ALE signal-assertion time relative to start access time. It is common to read and write accesses.

The GPMC\_CONFIG3\_i[12-8] ADVRDOFFTIME (read access) and GPMC\_CONFIG3\_i[20-16] ADVWROFFTIME (write access) bit fields define the ADVn\_ALE signal-deassertion time relative to start access time.

ADVONTIME can be used to control an address and byte enable valid setup time control before ADVn\_ALE assertion. ADVRDOFFTIME and ADVWROFFTIME can be used to control an address and byte enable valid hold time control after ADVn\_ALE de-assertion. ADVRDOFFTIME and ADVWROFFTIME are applicable to both synchronous and asynchronous modes.

ADVn\_ALE signal transitions as controlled through ADVONTIME, ADVRDOFFTIME, and ADVWROFFTIME can be delayed by half a GPMC\_FCLK period by enabling the GPMC\_CONFIG3\_i[7] ADVEXTRADELAY bit. This half of a GPMC\_FCLK period provides more granularity on ADVn\_ALE assertion and deassertion time to assure proper setup and hold time relative to GPMC\_CLK. The ADVEXTRADELAY configuration parameter is especially useful in configurations where GPMC\_CLK and GPMC\_FCLK have the same frequency, but can be used for all GPMC configurations. If enabled, ADVEXTRADELAY applies to all parameters controlling ADVn\_ALE transitions.

ADVEXTRADELAY must be used carefully to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program the RDCYCLETIME and WRCYCLETIME bit fields to be greater than ADVn\_ALE signal-deassertion time, including the extra half-GPMC\_FCLK-period delay.

The GPMC\_CONFIG3\_i[6-4] ADVAADMUXONTIME, GPMC\_CONFIG3\_i[26-24] ADVAADMUXRDOFFTIME, and GPMC\_CONFIG3\_i[30-28] ADVAADMUXWROFFTIME parameters have the same functions as ADVONTIME, ADVRDOFFTIME, and ADVWROFFTIME, but apply to the first address phase in the AAD-multiplexed protocol. It is the user responsibility to make sure ADVAADMUXxxOFFTIME is programmed to a value lower than or equal to ADVxxOFFTIME. Functionality in AAD-mux mode is undefined if the settings do not comply with this requirement. ADVAADMUXxxOFFTIME can be programmed to the same value as ADVONTIME if no high ADVn pulse is needed between the two AAD-mux address phases, which is the typical case in synchronous mode. In this configuration, ADVn is kept low until it reaches the correct ADVxxOFFTIME.

See [Section 7.1.3.3.12](#) for more details on ADVONTIME, ADVRDOFFTIME, ADVWROFFTIME, and ADVAADMUXRDOFFTIME, ADVAADMUXWROFFTIME usage for CLE and ALE (Command / Address Latch Enable) usage for a NAND Flash interface.

#### **7.1.3.3.9.4 OEn/REn: Output Enable / Read Enable Signal Control Assertion / Deassertion Time (OEONTIME / OEOFFTIME / OEEXTRADELAY / OEAADMUXONTIME / OEAADMUXOFFTIME)**

The GPMC\_CONFIG4\_i[3-0] OEONTIME field defines the OEn\_REn signal assertion time relative to start access time. It is applicable only to read accesses.

The GPMC\_CONFIG4\_i[12-8] OEOFFTIME field defines the OEn\_REn signal deassertion time relative to start access time. It is applicable only to read accesses. OEn\_REn is not asserted during a write cycle.

OEONTIME, OEOFFTIME, OEAADMUXONTIME and OEAADMUXOFFTIME parameters are applicable to synchronous and asynchronous modes. OEONTIME can be used to control an address and byte enable valid setup time control before OEn\_REn assertion. OEOFFTIME can be used to control an address and byte enable valid hold time control after OEn\_REn assertion.

OEAADMUXONTIME and OEAADMUXOFFTIME parameters have the same functions as OEONTIME and OEOFFTIME, but apply to the first OE assertion in the AAD-multiplexed protocol for a read phase, or to the only OE assertion for a write phase. It is the user responsibility to make sure OEAADMUXOFFTIME is programmed to a value lower than OEONTIME. Functionality in AAD-mux mode is undefined if the settings do not comply with this requirement. OEAADMUXOFFTIME shall never be equal to OEONTIME because the AAD-mux protocol requires a second address phase with the OEn signal de-asserted before OEn can be asserted again to define a read command.

The OEn\_REn signal transitions as controlled through OEONTIME, OEOFFTIME, OEAADMUXONTIME and OEAADMUXOFFTIME can be delayed by half a GPMC\_FCLK period by enabling the GPMC\_CONFIG4\_i[7] OEEXTRADELAY bit. This half of a GPMC\_FCLK period provides more granularity on OEn\_REn assertion and deassertion time to assure proper setup and hold time relative to GPMC\_CLK. If enabled, OEEXTRADELAY applies to all parameters controlling OEn\_REn transitions.

OEEXTRADELAY must be used carefully, to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program RDCYCLETIME and WRCYCLETIME to be greater than OEn\_REn signal-deassertion time, including the extra half-GPMC\_FCLK-period delay.

When the GPMC generates a read access to an address-/data-multiplexed device, it drives the address bus until OEn assertion time.

#### **7.1.3.3.9.5 WEn: Write Enable Signal Control Assertion / Deassertion Time (WEONTIME / WEOFFTIME / WEEXTRADELAY)**

The GPMC\_CONFIG4\_i[19-16] WEONTIME field (where i = 0 to 3) defines the WEn signal-assertion time relative to start access time. The GPMC\_CONFIG4\_i[28-24] WEOFFTIME field defines the WEn signal-deassertion time relative to start access time. These bit fields only apply to write accesses. WEn is not asserted during a read cycle.

WEONTIME can be used to control an address and byte enable valid setup time control before WEn assertion. WEOFFTIME can be used to control an address and byte enable valid hold time control after WEn assertion.

WEn signal transitions as controlled through WEONTIME, and WEOFFTIME can be delayed by half a GPMC\_FCLK period by enabling the GPMC\_CONFIG4\_i[23] WEEXTRADELAY bit. This half of a GPMC\_FCLK period provides more granularity on WEn assertion and deassertion time to guaranty proper setup and hold time relative to GPMC\_CLK. If enabled, WEEXTRADELAY applies to all parameters controlling WEn transitions.

The WEEXTRADELAY bit must be used carefully to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program the WRCYCLETIME bit field to be greater than the WEn signal-deassertion time, including the extra half-GPMC\_FCLK-period delay.

### 7.1.3.3.9.6 GPMC\_CLK

GPMC\_CLK is the external clock provided to the attached synchronous memory or device.

- The GPMC\_CLK clock frequency is the GPMC\_FCLK functional clock frequency divided by 1, 2, 3, or 4, depending on the GPMC\_CONFIG1\_i[1-0] GPMCFCLKDIVIDER bit field, with a guaranteed 50-percent duty cycle.
- The GPMC\_CLK clock is only activated when the access in progress is defined as synchronous (read or write access).
- The GPMC\_CONFIG1\_i[26-25] CLKACTIVATIONTIME field defines the number of GPMC\_FCLK cycles from start access time to GPMC\_CLK activation.
- The GPMC\_CLK clock is stopped when cycle time completes and is asserted low between accesses.
- The GPMC\_CLK clock is kept low when access is defined as asynchronous.
- When the GPMC is configured for synchronous mode, the GPMC\_CLK signal (which is an output) must also be set as an input in the Pin Mux configuration for the pin. GPMC\_CLK is looped back through the output and input buffers of the corresponding GPMC\_CLK pad at the device boundary. The looped-back clock is used to synchronize the sampling of the memory signals.

When cycle time completes, the GPMC\_CLK may be high because of the GPMCFCLKDIVIDER bit field. To ensure correct stoppage of the GPMC\_CLK clock within the 50-percent required duty cycle, it is the user's responsibility to extend the RDCYCLETIME or WRCYCLETIME value.

To ensure a correct external clock cycle, the following rules must be applied:

- $(RDCYCLETIME - CLKACTIVATIONTIME)$  must be a multiple of  $(GPMCFCLKDIVIDER + 1)$ .
- The PAGEBURSTACCESSTIME value must be a multiple of  $(GPMCFCLKDIVIDER + 1)$ .

### 7.1.3.3.9.7 GPMC\_CLK and Control Signals Setup and Hold

Control-signal transition (assertion and deassertion) setup and hold values with respect to the GPMC\_CLK edge can be controlled in the following ways:

- For the GPMC\_CLK signal, the GPMC\_CONFIG1\_i[26-25] CLKACTIVATIONTIME field allows setup and hold control of control-signal assertion time.
- The use of a divided GPMC\_CLK allows setup and hold control of control-signal assertion and deassertion times.
- When GPMC\_CLK runs at the GPMC\_FCLK frequency so that GPMC\_CLK edge and control-signal transitions refer to the same GPMC\_FCLK edge, the control-signal transitions can be delayed by half of a GPMC\_FCLK period to provide minimum setup and hold times. This half-GPMC\_FCLK delay is enabled with the CSEXTRADelay, ADVEXTRADelay, OEXTRADelay, or WEXTRADelay parameter. This delay must be used carefully to prevent control-signal overlap between successive accesses to different chip-selects. This implies that the RDCYCLETIME and WRCYCLETIME are greater than the last control-signal deassertion time, including the extra half-GPMC\_FCLK cycle.

### 7.1.3.3.9.8 Access Time (RDACCESSTIME / WRACCESSTIME)

The read access time and write access time durations can be programmed independently through GPMC\_CONFIG5\_i[20-16] RDACCESSTIME and GPMC\_CONFIG6\_i[28-24] WRACCESSTIME. This allows OEn and GPMC data capture timing parameters to be independent of WEn and memory device data capture timing parameters. RDACCESSTIME and WRACCESSTIME bit fields can be set with a granularity of 1 or 2 through GPMC\_CONFIG1\_i[4] TIMEPARAGRANULARITY.

#### 7.1.3.3.9.8.1 Access Time on Read Access

In asynchronous read mode, for single and paged accesses, GPMC\_CONFIG5\_i[[20-16] RDACCESSTIME field defines the number of GPMC\_FCLK cycles from start access time to the GPMC\_FCLK rising edge used for the first data capture. RDACCESSTIME must be programmed to the rounded greater value (in GPMC\_FCLK cycles) of the read access time of the attached memory device.

In synchronous read mode, for single or burst accesses, RDACCESSTIME defines the number of GPMC\_FCLK cycles from start access time to the GPMC\_FCLK rising edge corresponding to the GPMC\_CLK rising edge used for the first data capture.

GPMC\_CLK which is sent to the memory device for synchronization with the GPMC controller, is internally retimed to correctly latch the returned data. GPMC\_CONFIG5\_i[4-0] RDCYCLETIME must be greater than RDACCESSTIME in order to let the GPMC latch the last return data using the internally retimed GPMC\_CLK.

The external WAIT signal can be used in conjunction with RDACCESSTIME to control the effective GPMC data-capture GPMC\_FCLK edge on read access in both asynchronous mode and synchronous mode. For details about wait monitoring, see [Section 7.1.3.3.8.1](#).

#### **7.1.3.3.9.8.2 Access Time on Write Access**

In asynchronous write mode, the GPMC\_CONFIG6\_i[[28-24] WRACCESSTIME timing parameter is not used to define the effective write access time. Instead, it is used as a WAIT invalid timing window, and must be set to a correct value so that the gpmc\_wait pin is at a valid state two GPMC\_CLK cycles before WRACCESSTIME completes. For details about wait monitoring, see [Section 7.1.3.3.8.1](#).

In synchronous write mode, for single or burst accesses, WRACCESSTIME defines the number of GPMC\_FCLK cycles from start access time to the GPMC\_CLK rising edge used by the memory device for the first data capture.

The external WAIT signal can be used in conjunction with WRACCESSTIME to control the effective memory device data capture GPMC\_CLK edge for a synchronous write access. For details about wait monitoring, see [Section 7.1.3.3.8.1](#).

#### **7.1.3.3.9.9 Page Burst Access Time (PAGEBURSTACCESSTIME)**

GPMC\_CONFIG5\_i[27-24] PAGEBURSTACCESSTIME bit field can be set with a granularity of 1 or 2 through the GPMC\_CONFIG1\_i[[4] TIMEPARAGRANULARITY.

##### **7.1.3.3.9.9.1 Page Burst Access Time on Read Access**

In asynchronous page read mode, the delay between successive word captures in a page is controlled through the PAGEBURSTACCESSTIME bit field. The PAGEBURSTACCESSTIME parameter must be programmed to the rounded greater value (in GPMC\_FCLK cycles) of the read access time of the attached device.

In synchronous burst read mode, the delay between successive word captures in a burst is controlled through the PAGEBURSTACCESSTIME field.

The external WAIT signal can be used in conjunction with PAGEBURSTACCESSTIME to control the effective GPMC data capture GPMC\_FCLK edge on read access. For details about wait monitoring, see [Section 7.1.3.3.8.1](#).

##### **7.1.3.3.9.9.2 Page Burst Access Time on Write Access**

Asynchronous page write mode is not supported. PAGEBURSTACCESSTIME is irrelevant in this case.

In synchronous burst write mode, PAGEBURSTACCESSTIME controls the delay between successive memory device word captures in a burst.

The external WAIT signal can be used in conjunction with PAGEBURSTACCESSTIME to control the effective memory-device data capture GPMC\_CLK edge in synchronous write mode. For details about wait monitoring, see [Section 7.1.3.3.8.1](#).

#### **7.1.3.3.9.10 Bus Keeping Support**

At the end-cycle time of a read access, if no other access is pending, the GPMC drives the bus with the last data read after RDCYCLETIME completion time to prevent bus floating and reduce power consumption.

After a write access, if no other access is pending, the GPMC keeps driving the data bus after WRCYCLETIME completes with the same data to prevent bus floating and power consumption.

#### 7.1.3.3.10 NOR Access Description

For each chip-select configuration, the read access can be specified as either asynchronous or synchronous access through the GPMC\_CONFIG1\_j[29] READTYPE bit. For each chip-select configuration, the write access can be specified as either synchronous or asynchronous access through the GPMC\_CONFIG1\_j[27] WRITETYPE bit.

Asynchronous and synchronous read and write access time and related control signals are controlled through timing parameters that refer to GPMC\_FCLK. The primary difference of synchronous mode is the availability of a configurable clock interface (GPMC\_CLK) to control the external device. Synchronous mode also affects data-capture and wait-pin monitoring schemes in read access.

For details about asynchronous and synchronous access, see the descriptions of GPMC\_CLK, RdAccessTime, WrAccessTime, and wait-pin monitoring.

For more information about timing-parameter settings, see the sample timing diagrams in this chapter.

The address bus and BE[1:0]n are fixed for the duration of a synchronous burst read access, but they are updated for each beat of an asynchronous page-read access.

##### 7.1.3.3.10.1 Asynchronous Access Description

This section describes:

- Asynchronous single read operation on an address/data multiplexed device
- Asynchronous single write operation on an address/data-multiplexed device
- Asynchronous single read operation on an AAD-multiplexed device
- Asynchronous single write operation on an AAD-multiplexed device
- Asynchronous multiple (page) read operation on a non-multiplexed device

In asynchronous operations GPMC\_CLK is not provided outside the GPMC and is kept low.

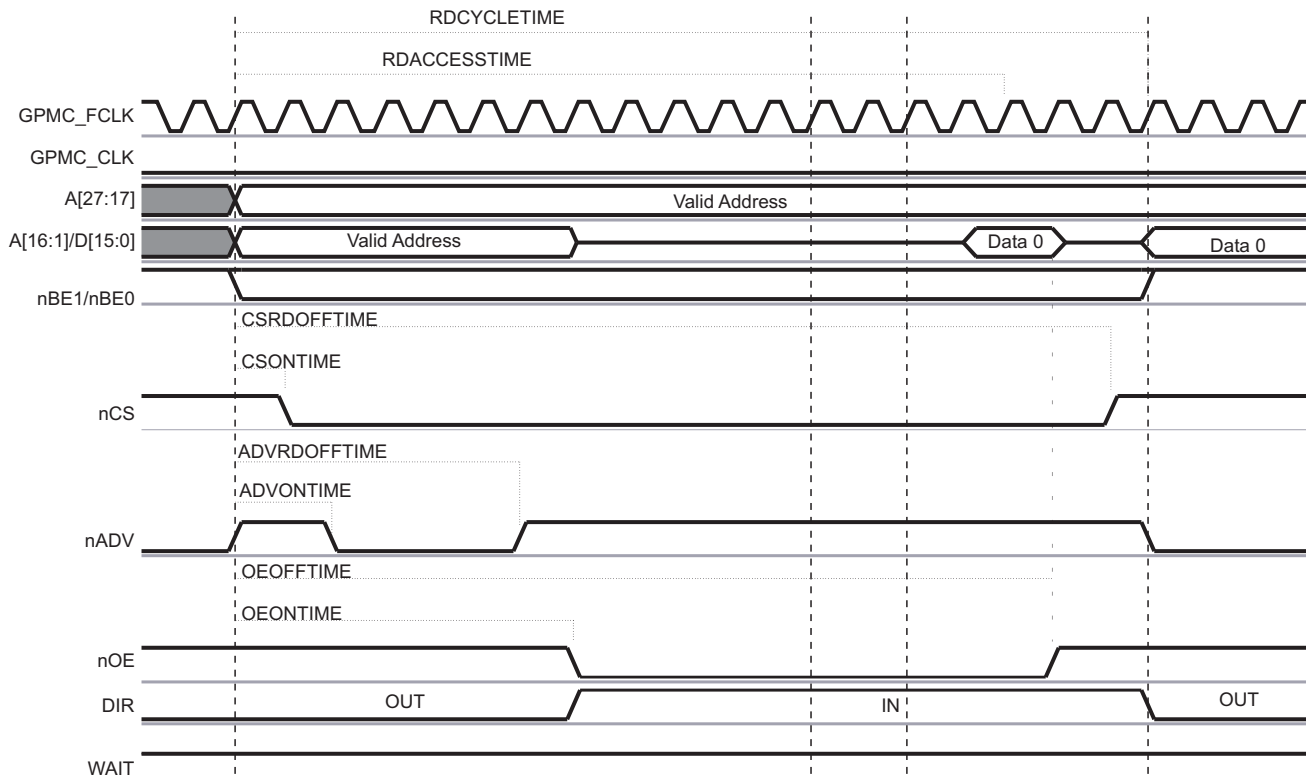

7.1.3.3.10.1.1 Access on Address/Data Multiplexed Devices

7.1.3.3.10.1.1.1 Asynchronous Single-Read Operation on an Address/Data Multiplexed Device

Figure 7-12 shows an asynchronous single read operation on an address/data-multiplexed device.

Figure 7-12. Asynchronous Single Read Operation on an Address/Data Multiplexed Device

7.1.3.3.10.1.1.2 Asynchronous Single Read on an Address/Data-Multiplexed Device

See Section 7.1.3.9.1 for formulas to calculate timing parameters.

Table 7-41 lists the timing bit fields to set up in order to configure the GPMC in asynchronous single read mode.

When the GPMC generates a read access to an address/data-multiplexed device, it drives the address bus until OEn assertion time. For details, see Section 7.1.3.3.8.2.3.

Address bits (A[16:1] from a GPMC perspective, A[15:0] from an external device perspective) are placed on the address/data bus, and the remaining address bits GPMC\_A[25:16] are placed on the address bus. The address phase ends at OEn assertion, when the DIR signal goes from OUT to IN.

- Chip-select signal CSn
  - CSn assertion time is controlled by the GPMC\_CONFIG2\_i[3-0] CSONTIME field. It controls the address setup time to CSn assertion.
  - CSn deassertion time is controlled by the GPMC\_CONFIG2\_i[12-8] CSRDOFFTIME field. It controls the address hold time from CSn deassertion
- Address valid signal ADVn
  - ADVn assertion time is controlled by the GPMC\_CONFIG3\_i[3-0] ADVONTIME field.
  - ADVn deassertion time is controlled by the GPMC\_CONFIG3\_i[[12-8] ADVRDOFFTIME field.

- Output enable signal OEn
  - OEn assertion indicates a read cycle.
  - OEn assertion time is controlled by the GPMC\_CONFIG4\_i[[3-0] OEONTIME field.
  - OEn deassertion time is controlled by the GPMC\_CONFIG4\_i[[12-8] OEOFFTIME field.
- Read data is latched when RDACCESSTIME completes. Access time is defined in the GPMC\_CONFIG5\_i[[20-16] RDACCESSTIME field.
- Direction signal DIR: DIR goes from OUT to IN at the same time that OEn is asserted.
- The end of the access is defined by the GPMC\_CONFIG5\_i[[4-0] RDCYCLETIME parameter.

In the GPMC, when a 16-bit wide device is attached to the controller, a 32-bit word write access is split into two 16-bit word write accesses. For more information about GPMC access size and type adaptation, see [Section 7.1.3.3.10.5](#). Between two successive accesses, if a OEn pulse is needed:

- The GPMC\_CONFIG6\_i[[11-8] CYCLE2CYCLEDELAY field can be programmed with GPMC\_CONFIG6\_i[[7] CYCLE2CYCLESAMECSEN enabled.
- The CSWROFFTIME and CSONTIME parameters also allow a chip-select pulse, but this affects all other types of access.

Figure 7-13 shows two asynchronous single-read accesses on an address/data-multiplexed devices.

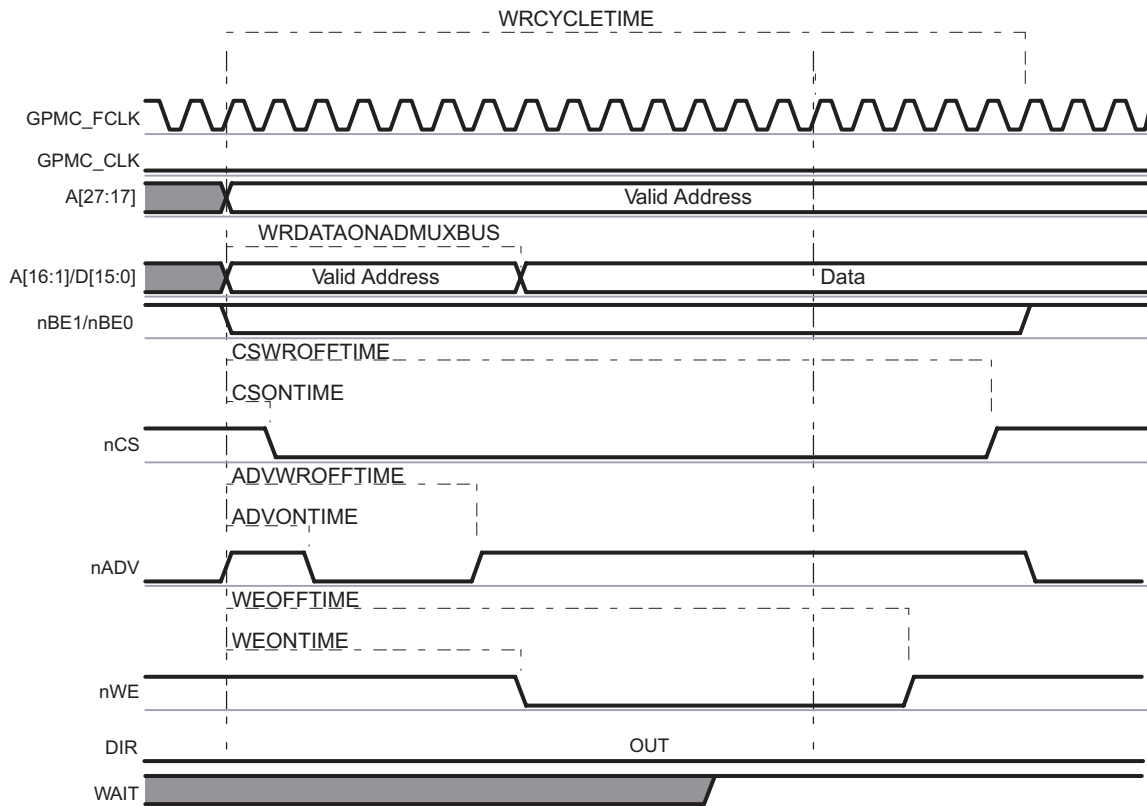

**Figure 7-13. Two Asynchronous Single Read Accesses on an Address/Data Multiplexed Device (32-Bit Read Split Into 2 × 16-Bit Read)**

**7.1.3.3.10.1.1.3 Asynchronous Single Write Operation on an Address/Data-Multiplexed Device**

Figure 7-14 shows an asynchronous single write operation on an address/data-multiplexed device.

**Figure 7-14. Asynchronous Single Write on an Address/Data-Multiplexed Device**

**7.1.3.3.10.1.1.4 Asynchronous Single Write on an Address/Data-Multiplexed Device**

See Section 7.1.3.9.1 for formulas to calculate timing parameters.

Table 7-41 lists the timing bit fields to set up in order to configure the GPMC in asynchronous single write mode. When the GPMC generates a write access to an address/data-multiplexed device, it drives the address bus until WEn assertion time. For more information, see Section 7.1.3.3.8.2.3.

The CSn and ADVn signals are controlled in the same way as for asynchronous single read operation on an address/data-multiplexed device.

- Write enable signal WEn
  - WEn assertion indicates a write cycle.
  - WEn assertion time is controlled by the GPMC\_CONFIG4\_i[19-16] WEONTIME field.
  - WEn deassertion time is controlled by the GPMC\_CONFIG4\_i[28-24] WEOFFTIME field.
- Direction signal DIR: DIR signal is OUT during the entire access.
- The end of the access is defined by the GPMC\_CONFIG5\_i[12-8] WRCYCLETIME parameter.

Address bits A[16:1] (GPMC point of view) are placed on the address/data bus at the start of cycle time, and the remaining address bits A[26:17] are placed on the address bus.

Data is driven on the address/data bus at a GPMC\_CONFIG6\_i[19-16] WRDATAONADMUXBUS time.

Write multiple access in asynchronous mode is not supported. If WRITEMULTIPLE is enabled with WRITETYPE as asynchronous, the GPMC processes single asynchronous accesses.

After a write operation, if no other access (read or write) is pending, the data bus keeps its previous value. See [Section 7.1.3.3.9.10](#).

### 7.1.3.3.10.1.1.5 Asynchronous Multiple (Page) Write Operation on an Address/Data-Multiplexed Device

Write multiple (page) access in asynchronous mode is not supported for address/data-multiplexed devices. If GPMC\_CONFIG1\_i[28] WRITEMULTIPLE is enabled (1) with GPMC\_CONFIG1\_i[27] WRITETYPE as asynchronous (0), the GPMC processes single asynchronous accesses.

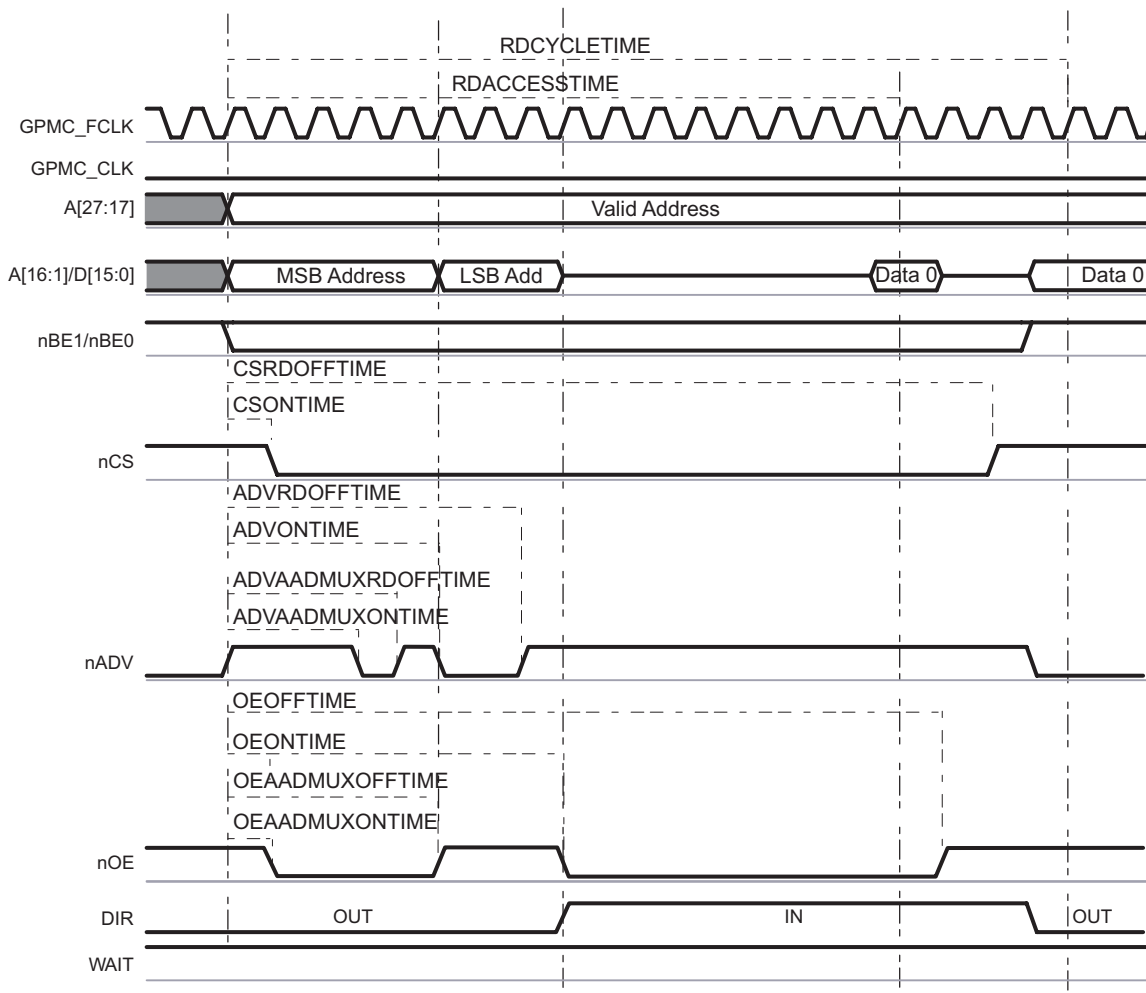

For accesses on non-multiplexed devices, see [Section 7.1.3.3.10.3](#).

### 7.1.3.3.10.1.2 Access on Address/Address/Data (AAD) Multiplexed Devices

#### 7.1.3.3.10.1.2.1 Asynchronous Single Read Operation on an AAD-Multiplexed Device

[Figure 7-15](#) shows an asynchronous single read operation on an AAD-multiplexed device.

**Figure 7-15. Asynchronous Single-Read on an AAD-Multiplexed Device**

### 7.1.3.3.10.1.2.2 Asynchronous Single Read on an AAD-Multiplexed Device

See [Section 7.1.3.9.1](#) for formulas to calculate timing parameters.

[Table 7-41](#) lists the timing bit fields to set up in order to configure the GPMC in asynchronous single write mode.

When the GPMC generates a read access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with OEn driven low. The first address phase ends at the first OEn deassertion time. The second phase for LSB address is qualified with OEn driven high. The second address phase ends at the second OEn assertion time, when the DIR signal goes from OUT to IN.

The CSn and DIR signals are controlled in the same way as for asynchronous single read operation on an address/data-multiplexed device.

- Address valid signal ADVn. ADVn is asserted and deasserted twice during a read transaction:
  - ADVn first assertion time is controlled by the GPMC\_CONFIG3\_i[6-4] ADVAADMUXONTIME field.
  - ADVn first deassertion time is controlled by the GPMC\_CONFIG3\_i[26-24] ADVAADMUXRDOFFTIME field.
  - ADVn second assertion time is controlled by the GPMC\_CONFIG3\_i[3-0] ADVONTIME field.
  - ADVn second deassertion time is controlled by the GPMC\_CONFIG3\_i[12-8] ADVRDOFFTIME field.
- Output Enable signal OEn. OEn is asserted and deasserted twice during a read transaction (OEn second assertion indicates a read cycle):
  - OEn first assertion time is controlled by the GPMC\_CONFIG4\_i[6-4] OEAADMUXONTIME field.
  - OEn first deassertion time is controlled by the GPMC\_CONFIG3\_i[15-13] OEAADMUXOFFTIME field.
  - OEn second assertion time is controlled by the GPMC\_CONFIG4\_i[3-0] OEONTIME field.
  - OEn second deassertion time is controlled by the GPMC\_CONFIG4\_i[12-8] OEOFFTIME field.

7.1.3.3.10.1.2.3 Asynchronous Single Write Operation on an AAD-Multiplexed Device

Figure 7-16 shows an asynchronous single write operation on an AAD-multiplexed device.

Figure 7-16. Asynchronous Single Write on an AAD-Multiplexed Device

See [Section 7.1.3.9.1](#) for formulas to calculate timing parameters.

[Table 7-41](#) lists the timing bit fields to set up to configure the GPMC in asynchronous single write mode.

When the GPMC generates a write access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with OEn driven low. The second phase for LSB address is qualified with OEn driven high. The address phase ends at WEn assertion time.

The CSn, WEn, and DIR signals are controlled in the same way as for asynchronous single write operation on an address/data-multiplexed device.

- Address valid signal ADVn is asserted and deasserted twice during a write transaction
  - ADVn first assertion time is controlled by the GPMC\_CONFIG3\_i[6-4] ADVAADMUXONTIME field.
  - ADVn first deassertion time is controlled by the GPMC\_CONFIG3\_i[30-28] ADVAADMUXWROFFTIME field.
  - ADVn second assertion time is controlled by the GPMC\_CONFIG3\_i[3-0] ADVONTIME field.
  - ADVn second deassertion time is controlled by the GPMC\_CONFIG3\_i[20-16] ADVWROFFTIME field.
- Output Enable signal OEn is asserted during the address phase of a write transaction
  - OEn assertion time is controlled by the GPMC\_CONFIG4\_i[6-4] OEAADMUXONTIME field.
  - OEn deassertion time is controlled by the GPMC\_CONFIG3\_i[15-13] OEAADMUXOFFTIME field.

The address bits for the first address phase are driven onto the data bus until OEn deassertion. Data is driven onto the address/data bus at the clock edge defined by the GPMC\_CONFIG6\_i[19-16] WRDATAONADMUXBUS parameter.

#### **7.1.3.3.10.1.2.4 Asynchronous Multiple (Page) Read Operation on an AAD-Multiplexed Device**

Write multiple (page) access in asynchronous mode is not supported for AAD-multiplexed devices.

If GPMC\_CONFIG1\_i[28] WRITEMULTIPLE is enabled (1) with GPMC\_CONFIG1\_i[27] WRITETYPE as asynchronous (0), the GPMC processes single asynchronous accesses.

For accesses on non-multiplexed devices, see [Section 7.1.3.3.10.3](#).

#### **7.1.3.3.10.2 Synchronous Access Description**

This section details read and write synchronous accesses on address/data multiplexed. All information in this section can be applied to any type of memory - non-multiplexed, address and data multiplexed or AAD-multiplexed - with a difference limited to the address phase. For accesses on non-multiplexed devices, see [Section 7.1.3.3.10.3](#).

In synchronous operations:

- The GPMC\_CLK clock is provided outside the GPMC when accessing the memory device.
- The GPMC\_CLK clock is derived from the GPMC\_FCLK clock using the GPMC\_CONFIG1\_i[1-0] GPMCFCLKDIVIDER field. In the following section, i stands for the chip-select number, i = 0 to 3.
- The GPMC\_CONFIG1\_i[26-25] CLKACTIVATIONTIME field specifies that the GPMC\_CLK is provided outside the GPMC 0, 1, or 2 GPMC\_FCLK cycles after start access time until RDCYCLETIME or WRCYCLETIME completion.

7.1.3.3.10.2.1 Synchronous Single Read

Figure 7-17 and Figure 7-18 show a synchronous single-read operation with GPMCFCLKDIVIDER equal to 0 and 1, respectively.

Figure 7-17. Synchronous Single Read (GPMCFCLKDIVIDER = 0)

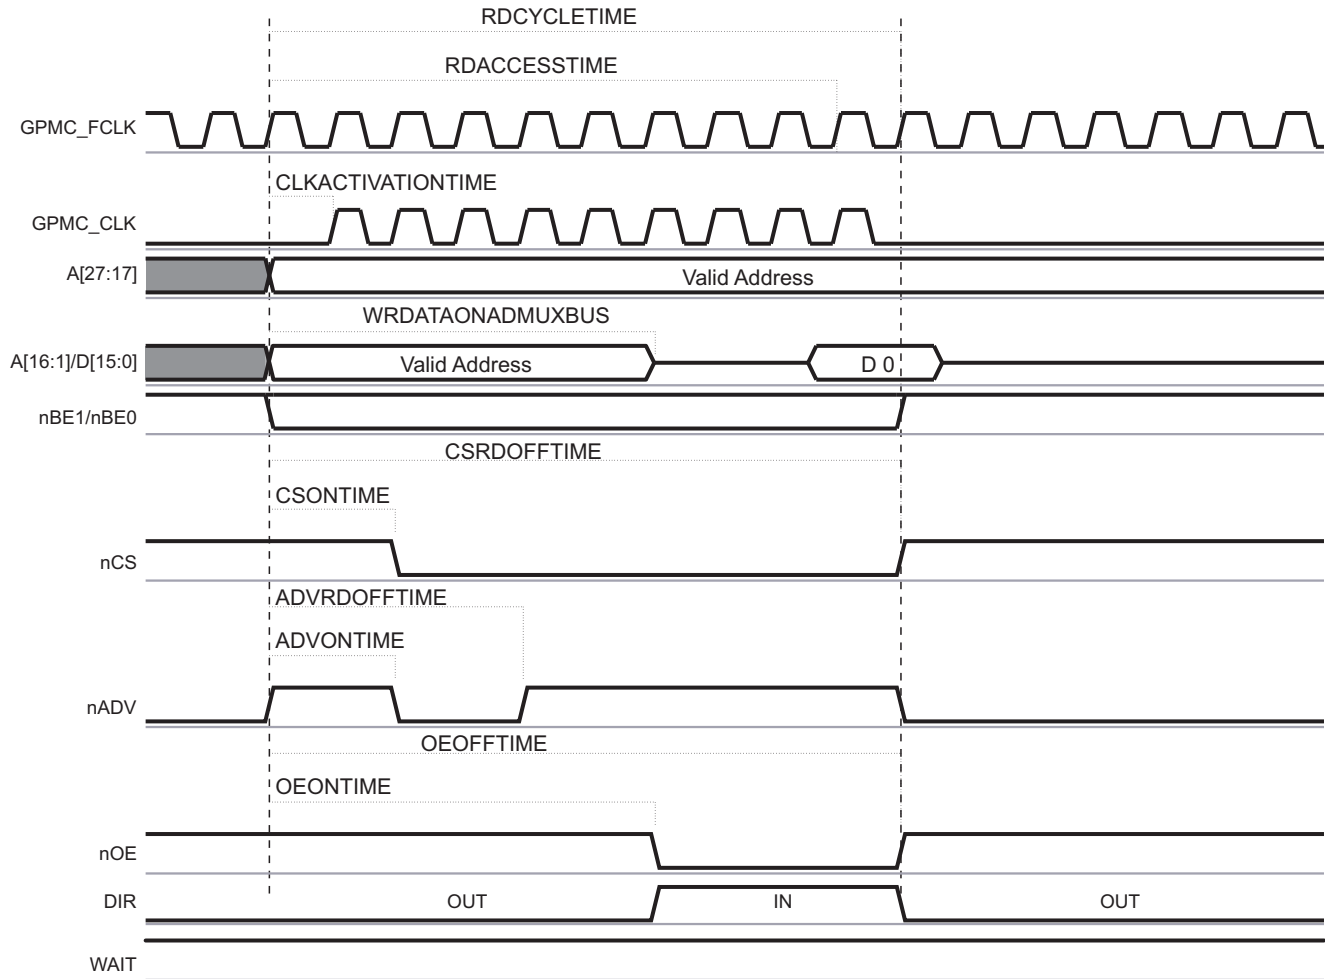

Figure 7-18. Synchronous Single Read (GPMCFCLKDIVIDER = 1)

See Section 7.1.3.9.1 for formulas to calculate timing parameters.

Table 7-41 lists the timing bit fields to set up in order to configure the GPMC in asynchronous single read mode.

When the GPMC generates a read access to an address/data-multiplexed device, it drives the address bus until OEn assertion time. For details, see Section 7.1.3.3.8.2.3.

- Chip-select signal CSn
  - CSn assertion time is controlled by the GPMC\_CONFIG2\_i[3-0] CSONTIME field and ensures address setup time to CSn assertion.
  - CSn deassertion time is controlled by the GPMC\_CONFIG2\_i[12-8] CSRDOFFTIME field and ensures address hold time to CSn deassertion.
- Address valid signal ADVn
  - ADVn assertion time is controlled by the GPMC\_CONFIG3\_i[3-0] ADVONTIME field.
  - ADVn deassertion time is controlled by the GPMC\_CONFIG3\_i[12-8] ADVRDOFFTIME field.
- Output enable signal OEn
  - OEn assertion indicates a read cycle.
  - OEn assertion time is controlled by the GPMC\_CONFIG4\_i[3-0] OEONTIME field.
  - OEn deassertion time is controlled by the GPMC\_CONFIG4\_i[12-8] OEOFFTIME field.
- Initial latency for the first read data is controlled by GPMC\_CONFIG5\_i[20-16] RDACCESSTIME or by monitoring the WAIT signal.
- Total access time (GPMC\_CONFIG5\_i[4-0] RDCYCLETIME) corresponds to RDACCESSTIME plus the address hold time from CSn deassertion, plus time from RDACCESSTIME to CSRDOFFTIME.

- Direction signal DIR: DIR goes from OUT to IN at the same time as OEn assertion.

When the GPMC generates a write access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with OEn driven low. The second phase for LSB address is qualified with OEn driven high. The address phase ends at WEn assertion time.

The CSn and DIR signals are controlled in the same way as for synchronous single read operation on an address/data-multiplexed device.

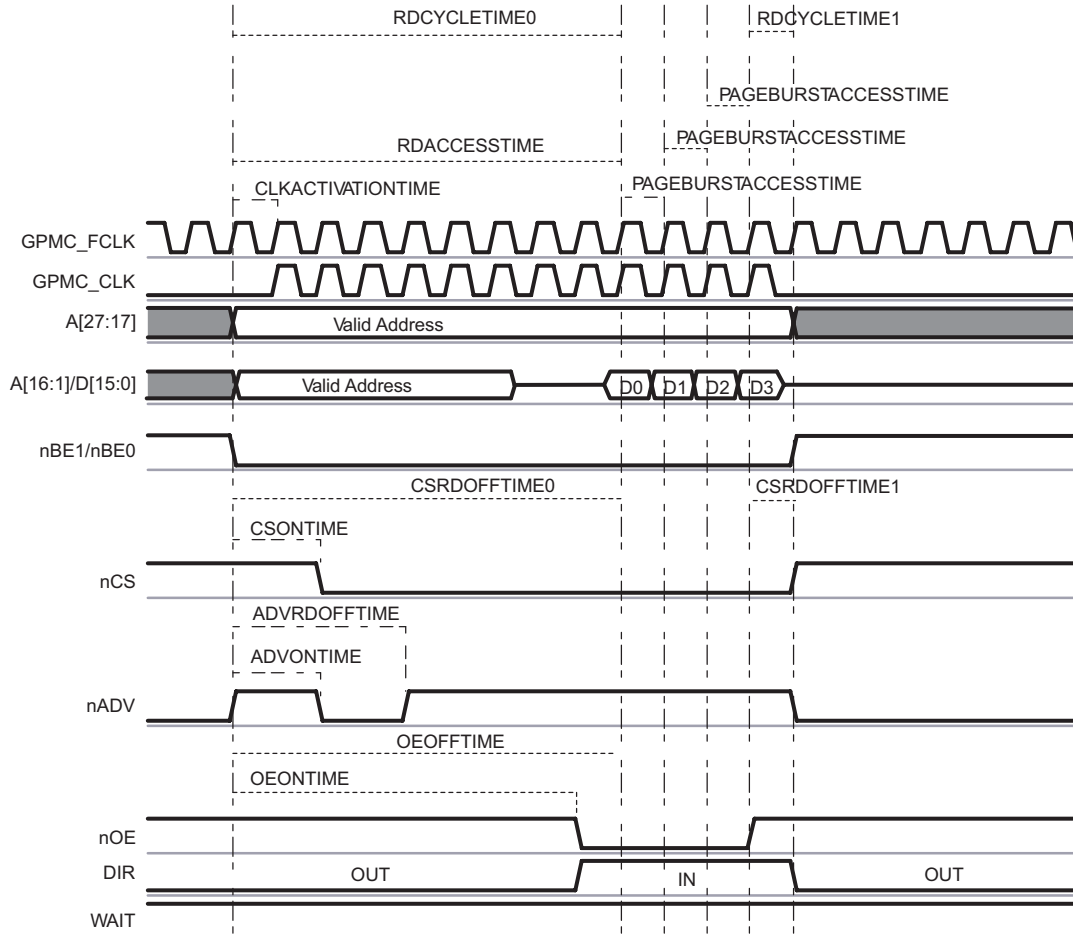

- Address valid signal ADVn is asserted and deasserted twice during a read transaction
  - ADVn first assertion time is controlled by the GPMC\_CONFIG3\_i[6-4] ADVAADMUXONTIME field.
  - ADVn first deassertion time is controlled by the GPMC\_CONFIG3\_i[26-24] ADVAADMUXRDOFFTIME field.
  - ADVn second assertion time is controlled by the GPMC\_CONFIG3\_i[3-0] ADVONTIME field.
  - ADVn second deassertion time is controlled by the GPMC\_CONFIG3\_i[12-8] ADVRDOFFTIME field.
- Output Enable signal OEn is asserted and deasserted twice during a read transaction (OEn second assertion indicates a read cycle)
  - OEn first assertion time is controlled by the GPMC\_CONFIG4\_i[6-4] OEAADMUXONTIME field.
  - OEn first deassertion time is controlled by the GPMC\_CONFIG3\_i[15-13] OEAADMUXOFFTIME field.
  - OEn second assertion time is controlled by the GPMC\_CONFIG4\_i[3-0] OEONTIME field.
  - OEn second deassertion time is controlled by the GPMC\_CONFIG4\_i[12-8] OEOFFTIME field.

After a read operation, if no other access (read or write) is pending, the data bus is driven with the previous read value. See [Section 7.1.3.3.9.10](#).

7.1.3.3.10.2.2 Synchronous Multiple (Burst) Read (4-, 8-, 16-Word 16 Burst With Wraparound Capability)

Figure 7-19 and Figure 7-20 show a synchronous multiple read operation with GPMCFCLKDivider equal to 0 and 1, respectively.

Figure 7-19. Synchronous Multiple (Burst) Read (GPMCFCLKDIVIDER = 0)

**Figure 7-20. Synchronous Multiple (Burst) Read (GPMCFCLKDIVIDER = 1)**

When GPMC\_CONFIG5\_i[20-16] RDACCESSTIME completes, control-signal timings are frozen during the multiple data transactions, corresponding to GPMC\_CONFIG5\_i[27-24] PAGEBURSTACCESSTIME multiplied by the number of remaining data transactions.

The CSn, ADVn, OEn and DIR signals are controlled in the same way as for synchronous single read operation. See [Section 7.1.3.3.10.2.1](#).

Initial latency for the first read data is controlled by RDACCESSTIME or by monitoring the WAIT signal. Successive read data are provided by the memory device each one or two GPMC\_CLK cycles. The PAGEBURSTACCESSTIME parameter must be set accordingly with GPMC\_CONFIG1\_i[1-0] GPMCFCLKDIVIDER and the memory-device internal configuration. Depending on the device page length, the GPMC checks device page crossing during a new burst request and purposely insert initial latency (of RDACCESSTIME) when required.

Total access time GPMC\_CONFIG5\_i[4-0] RDCYCLETIME corresponds to RDACCESSTIME plus the address hold time from CSn deassertion. In [Figure 7-19](#), RDCYCLETIME programmed value equals to  $RDCYCLETIME0 + RDCYCLETIME1$ .

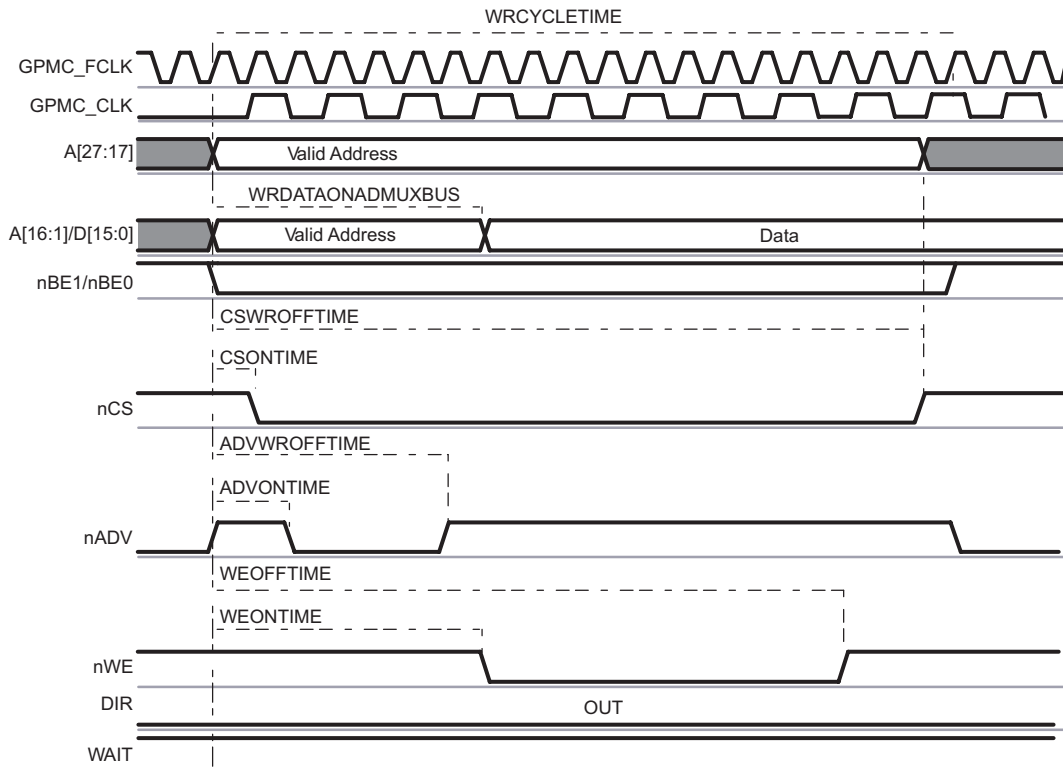

After a read operation, if no other access (read or write) is pending, the data bus is driven with the previous read value. See [Section 7.1.3.3.9.10](#).

Burst wraparound is enabled through the GPMC\_CONFIG1\_i[31] WRAPBURST bit and allows a 4-, 8-, or 16-Word16 linear burst access to wrap within its burst-length boundary through GPMC\_CONFIG1\_i[24-23] ATTACHEDDEVICEPAGELENGTH.

7.1.3.3.10.2.3 Synchronous Single Write

Burst write mode is used for synchronous single or burst accesses (see Figure 7-21).

Figure 7-21. Synchronous Single Write on an Address/Data-Multiplexed Device

When the GPMC generates a write access to an address/data-multiplexed device, it drives the data bus (with address bits A[16:1]) until [19:16] WRDATAONADMUXBUS time. First data of the burst is driven on the address/data bus at WRDATAONADMUXBUS time.

7.1.3.3.10.2.4 Synchronous Multiple (Burst) Write

Synchronous burst write mode provides synchronous single or consecutive accesses. Figure 7-22 shows a synchronous burst write access when the chip-select is configured in address/data-multiplexed mode.

Figure 7-22. Synchronous Multiple Write (Burst Write) in Address/Data-Multiplexed Mode

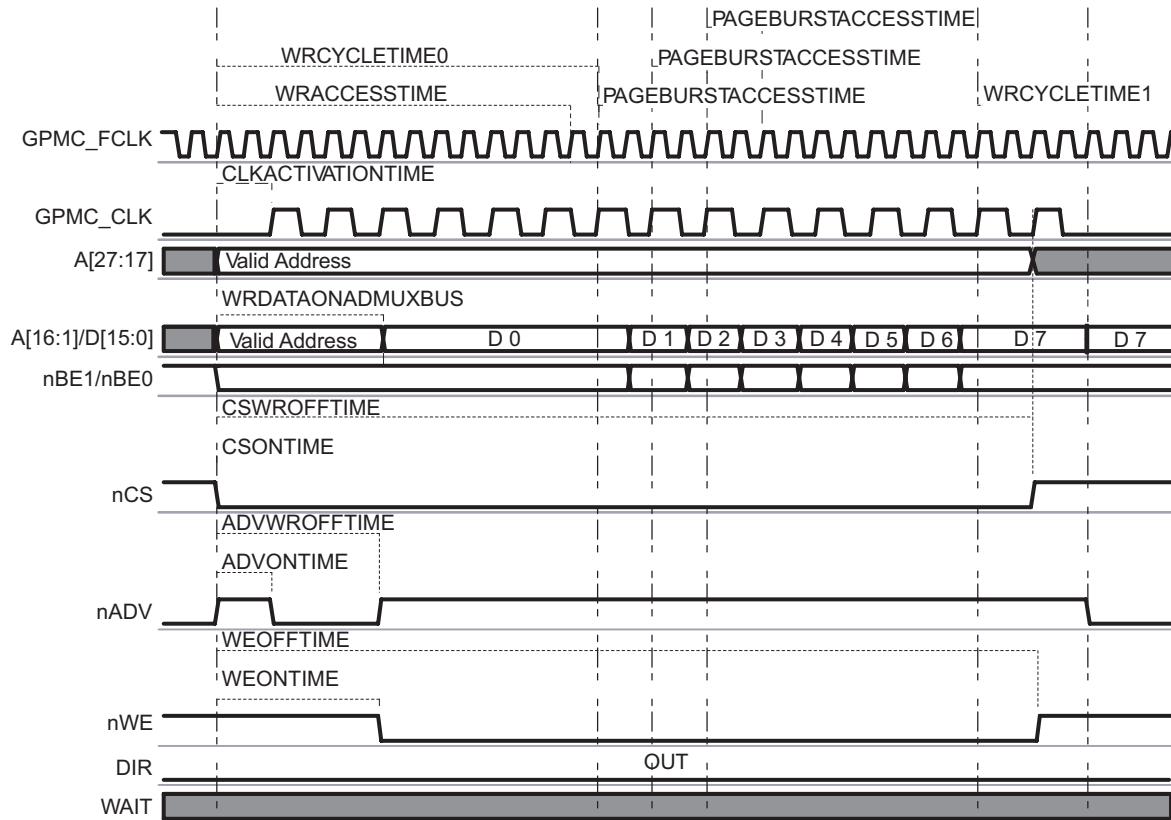

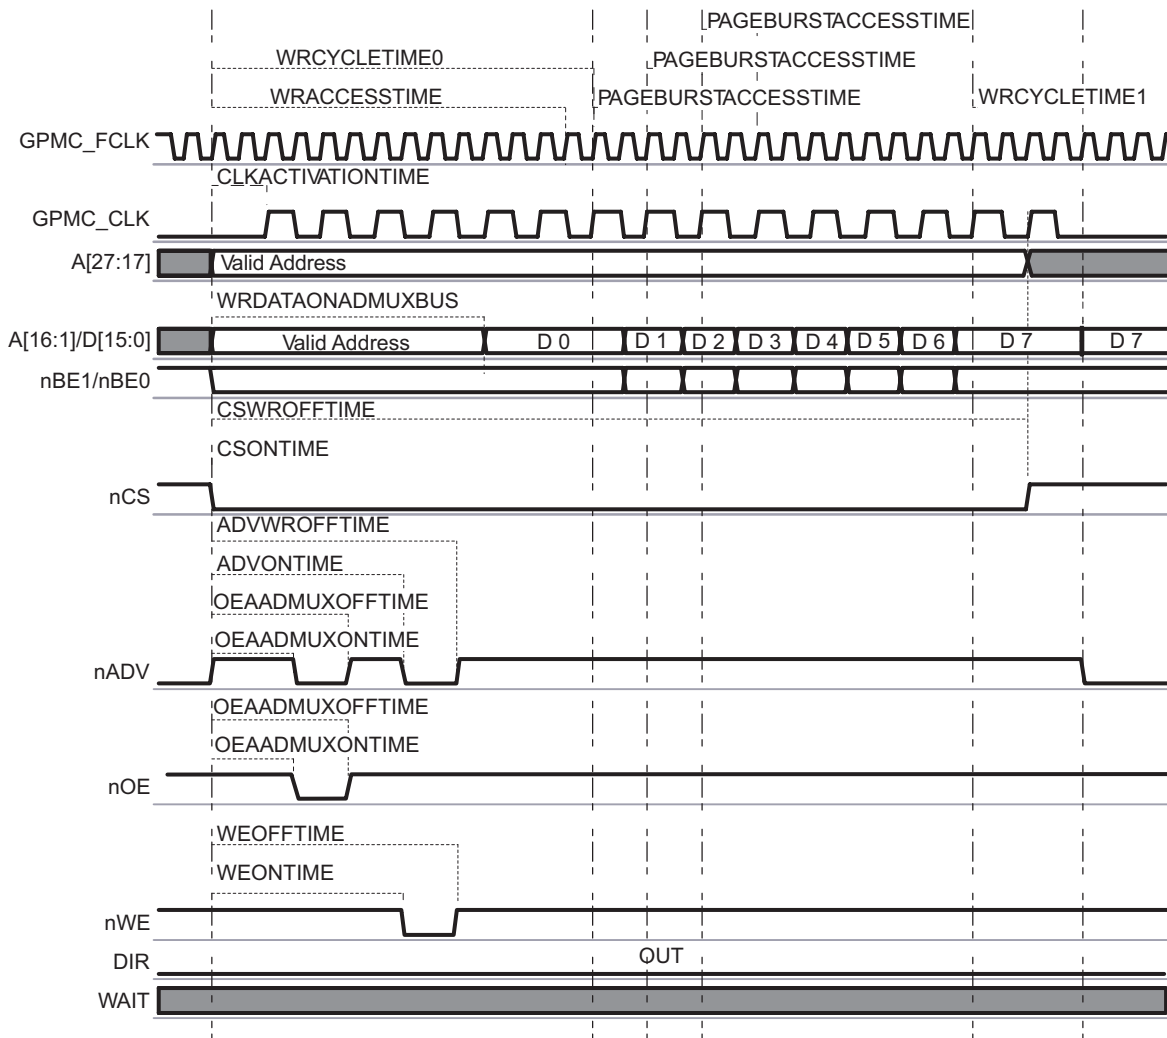

Figure 7-23 shows the same synchronous burst write access when the chip-select is configured in address/address/data-multiplexed (AAD-multiplexed) mode.

Figure 7-23. Synchronous Multiple Write (Burst Write) in Address/Address/Data-Multiplexed Mode

The first data of the burst is driven on the A/D bus at GPMC\_CONFIG6\_i[19:16] WRDATAONADMUXBUS.

When WRACCESTIME completes, control-signal timings are frozen during the multiple data transactions, corresponding to the GPMC\_CONFIG5\_i[27-24] PAGEBURSTACCESTIME multiplied by the number of remaining data transactions.

When the GPMC generates a read access to an address/data-multiplexed device, it drives the address bus until OEn assertion time. For details, see [Section 7.1.3.3.8.2.3](#).

- Chip-select signal CSn
  - CSn assertion time is controlled by the GPMC\_CONFIG2\_i[3-0] CSONTIME field and ensures address setup time to CSn assertion.
  - CSn deassertion time controlled by the GPMC\_CONFIG2\_i[20-16] CSWROFFTIME field and ensures address hold time to CSn deassertion.
- Address valid signal ADVn
  - ADVn assertion time is controlled by the GPMC\_CONFIG3\_i[3-0] ADVONTIME field.
  - ADVn deassertion time is controlled by the GPMC\_CONFIG3\_i[20-16] ADVWROFFTIME field.

- Write enable signal WEn
  - WEn assertion indicates a read cycle.
  - WEn assertion time is controlled by the GPMC\_CONFIG4\_i[19-16] WEONTIME field.
  - WEn deassertion time is controlled by the GPMC\_CONFIG4\_i[28-24] WEOFFTIME field.

The WEn falling edge must not be used to control the time when the burst first data is driven in the address/data bus because some new devices require the WEn signal at low during the address phase.
- Direction signal DIR is OUT during the entire access.

When the GPMC generates a write access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with OEn driven low. The second phase for LSB address is qualified with OEn driven high. The address phase ends at WEn assertion time.

The CSn and DIR signals are controlled as detailed above.

- Address valid signal ADVn is asserted and deasserted twice during a read transaction
  - ADVn first assertion time is controlled by the GPMC\_CONFIG3\_i[[6-4] ADVAADMUXONTIME field.
  - ADVn first deassertion time is controlled by the GPMC\_CONFIG3\_i[[26-24] ADVAADMUXRDOFFTIME field.
  - ADVn second assertion time is controlled by the GPMC\_CONFIG3\_i[[3-0] ADVONTIME field.
  - ADVn second deassertion time is controlled by the GPMC\_CONFIG3\_i[[12-8] ADVRDOFFTIME field.
- Output Enable signal OEn is asserted and deasserted twice during a read transaction (OEn second assertion indicates a read cycle)
  - OEn first assertion time is controlled by the GPMC\_CONFIG4\_i[[6-4] OEAADMUXONTIME field.
  - OEn first deassertion time is controlled by the GPMC\_CONFIG4\_i[15-13] OEAADMUXOFFTIME field.
  - OEn second assertion time is controlled by the GPMC\_CONFIG4\_i[3-0] OEONTIME field.
  - OEn second deassertion time is controlled by the GPMC\_CONFIG4\_i[12-8] OEOFFTIME field.

First write data is driven by the GPMC at GPMC\_CONFIG6\_i[19-16] WRDATAONADMUXBUS, when in address/data mux configuration. The next write data of the burst is driven on the bus at WRACCESSTIME + 1 during GPMC\_CONFIG5\_i[27-24] PAGEBURSTACCESSTIME GPMC\_FCLK cycles. The last data of the synchronous burst write is driven until GPMC\_CONFIG5\_i[12-8] WRCYCLETIME completes.

- WRACCESSTIME is defined in the GPMC\_CONFIG6\_i[28-24] register.
- The PAGEBURSTACCESSTIME parameter must be set accordingly with GPMCFCLKDIVIDER and the memory-device internal configuration.

Total access time GPMC\_CONFIG5\_i[12-8] WRCYCLETIME corresponds to WRACCESSTIME plus the address hold time from CSn deassertion. In [Figure 7-23](#) the WRCYCLETIME programmed value equals WRCYCLETIME0 + WRCYCLETIME1. WRCYCLETIME0 and WRCYCLETIME1 delays are not actual parameters and are only a graphical representation of the full WRCYCLETIME value.

After a write operation, if no other access (read or write) is pending, the data bus keeps the previous value. See [Section 7.1.3.3.9.10](#).

### 7.1.3.3.10.3 Asynchronous and Synchronous Accesses in Nonmultiplexed Mode

Page mode is only available in non-multiplexed mode.

- Asynchronous single read operation on a nonmultiplexed device
- Asynchronous single write operation on a nonmultiplexed device
- Asynchronous multiple (page mode) read operation on a nonmultiplexed device
- Synchronous operations on a nonmultiplexed device

7.1.3.3.10.3.1 Asynchronous Single Read Operation on a Nonmultiplexed Device

Figure 7-24 shows an asynchronous single read operation on a nonmultiplexed device.

Figure 7-24. Asynchronous Single Read on an Address/Data-Nonmultiplexed Device

The 27-bit address is driven onto the address bus A[27:1] and the 16-bit data is driven onto the data bus D[15:0].

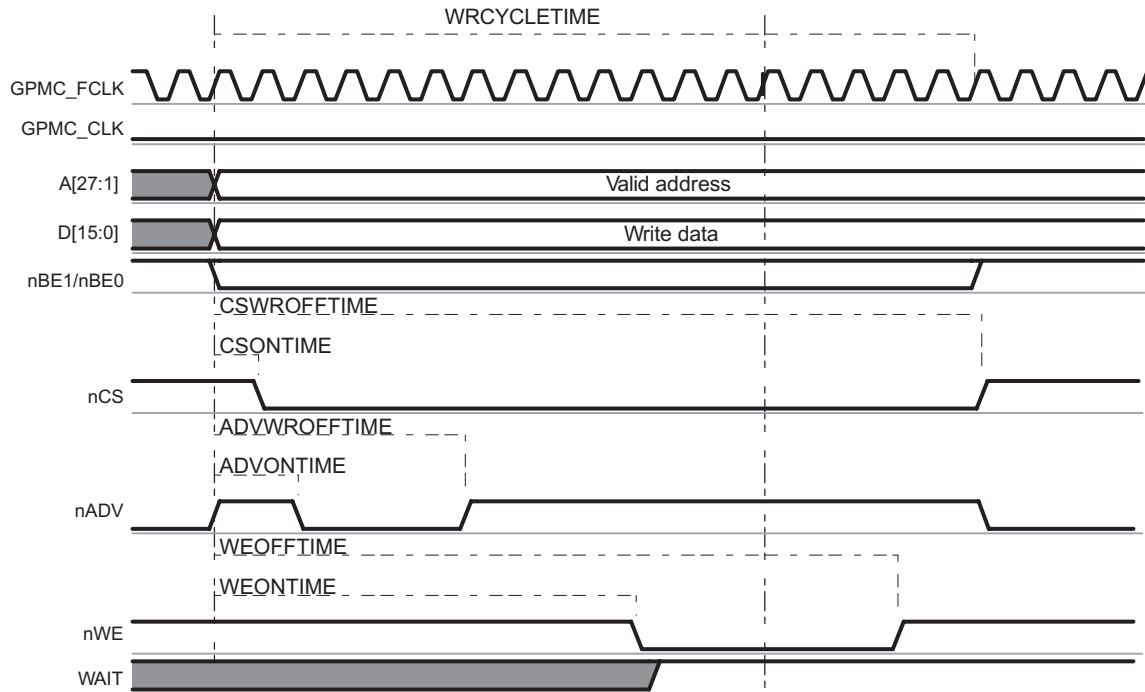

Read data is latched at GPMC\_CONFIG1\_5[20-16] RDACCESSTIME completion time. The end of the access is defined by the GPMC\_CONFIG1\_5[4-0] RDCYCLETIME parameter.

CSn, ADVn, OEn and DIR signals are controlled in the same way as address/data multiplexed accesses, see Section 7.1.3.3.10.1.1.2.

### 7.1.3.3.10.3.2 Asynchronous Single Write Operation on a Nonmultiplexed Device

Figure 7-25 shows an asynchronous single write operation on a nonmultiplexed device.

**Figure 7-25. Asynchronous Single Write on an Address/Data-Nonmultiplexed Device**

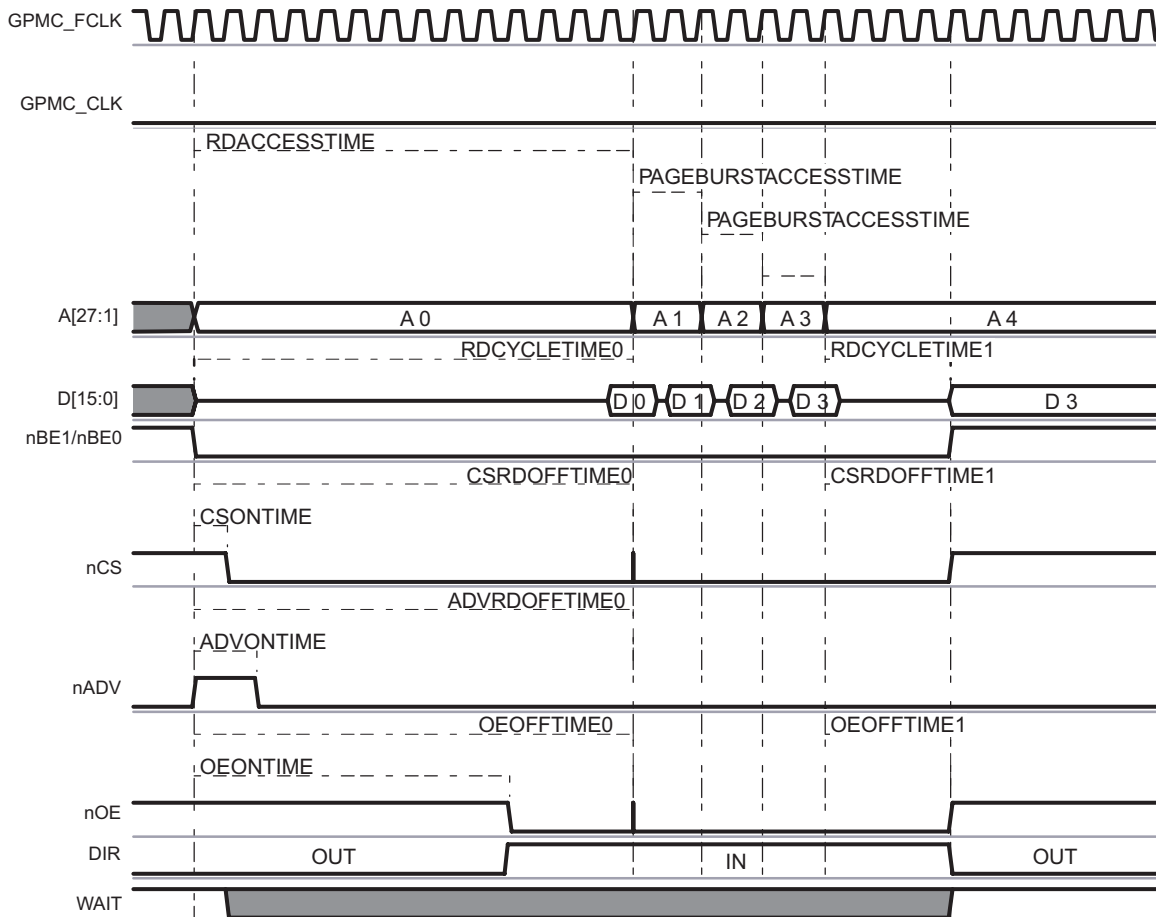

The 27-bit address is driven onto the address bus A[27:1] and the 16-bit data is driven onto the data bus D[15:0].

CSn, ADVn, WEn and DIR signals are controlled in the same way as address/data multiplexed accesses, see [Section 7.1.3.3.10.1.1.3](#).

7.1.3.3.10.3.3 Asynchronous Multiple (Page Mode) Read Operation on a Nonmultiplexed Device

Figure 7-26 shows an asynchronous multiple read operation on a Nonmultiplexed Device, in which two word32 host read accesses to the GPMC are split into one multiple (page mode of 4 word16) read access to the attached device.

Figure 7-26. Asynchronous Multiple (Page Mode) Read

The WAIT signal is active low.

CSn, ADVn, OEn and DIR signals are controlled in the same way as address/data multiplexed accesses, see Section 7.1.3.3.10.1.1.2.

When RDACCESSTIME completes, control-signal timings are frozen during the multiple data transactions, corresponding to PAGEBURSTACCESSTIME multiplied by the number of remaining data transactions.

Read data is latched at GPMC\_CONFIG5\_i[20-16] RDACCESSTIME completion time. The end of the access is defined by the GPMC\_CONFIG5\_i[4-0] RDCYCLETIME parameter.

During consecutive accesses, the GPMC increments the address after each data read completes.

Delay between successive read data in the page is controlled by the GPMC\_CONFIG5\_i[27-24] PAGEBURSTACCESSTIME parameter. Depending on the device page length, the GPMC can control device page crossing during a burst request and insert initial RDACCESSTIME latency. Note that page crossing is only possible with a new burst access, meaning a new initial access phase is initiated.

Total access time RDCYCLETIME corresponds to RDACCESSTIME plus the address hold time starting from the CSn deassertion.

- The read cycle time is defined in the GPMC\_CONFIG5\_i[4-0] RDCYCLETIME field.
- In Figure 7-26, the RDCYCLETIME programmed value equals RDCYCLETIME0 (before paged accesses) + RDCYCLETIME1 (after paged accesses).

#### 7.1.3.3.10.3.4 Synchronous Operations on a Nonmultiplexed Device

All information for this section is equivalent to similar operations for address/data- or AAD-multiplexed accesses. The only difference resides in the address phase. See [Section 7.1.3.6](#).

#### 7.1.3.3.10.4 Page and Burst Support

Each chip-select can be configured to process system single or burst requests into successive single accesses or asynchronous page/synchronous burst accesses, with appropriate access size adaptation.

Depending on the external device page or burst capability, read and write accesses can be independently configured through the GPMC. The GPMC\_CONFIG1\_i[30] READMULTIPLE and GPMC\_CONFIG1\_i[28] WRITMULTIPLE bits are associated with the READTYPE and WRITETYPE parameters.

- Asynchronous write page mode is not supported.
- 8-bit wide device support is limited to nonburstable devices (READMULTIPLE and WRITEMULTIPLE are ignored).
- Not applicable to NAND device interfacing.

#### 7.1.3.3.10.5 System Burst Versus External Device Burst Support

The device system can issue the following requests to the GPMC:

- Byte, 16-bit word, 32-bit word requests (byte enable controlled). This is always a single request from the interconnect point of view.
- Incrementing fixed-length bursts of two words, four words, and eight words
- Wrapped (critical word access first) fixed-length burst of two, four, or eight words

To process a system request with the optimal protocol, the READMULTIPLE (and READTYPE) and WRITEMULTIPLE (and WRITETYPE) parameters must be set according to the burstable capability (synchronous or asynchronous) of the attached device.

The GPMC access engine issues only fixed-length burst. The maximum length that can be issued is defined per CS by the GPMC\_CONFIG1\_i[24-23] ATTACHEDDEVICEPAGELENGTH field. When the ATTACHEDDEVICEPAGELENGTH value is less than the system burst request length (including the appropriate access size adaptation according to the device width), the GPMC splits the system burst request into multiple bursts. Within the specified 4-, 8-, or 16-word value, the ATTACHEDDEVICEPAGELENGTH field value must correspond to the maximum-length burst supported by the memory device configured in fixed-length burst mode (as opposed to continuous burst mode).

To get optimal performance from memory devices that natively support 16 Word16-length-wrapping burst capability (critical word access first), the ATTACHEDDEVICEPAGELENGTH parameter must be set to 16 words and the GPMC\_CONFIG1\_i[31] WRAPBURST bit must be set to 1. Similarly DEVICESPAGELENGTH is set to 4 and 8 for memories supporting respectively 4 and 8 Word16-length-wrapping burst.

When the memory device does not offer (or is not configured to offer) native 16 Word16-length-wrapping burst, the WRAPBURST parameter must be cleared, and the GPMC access engine emulates the wrapping burst by issuing the appropriate burst sequences according to the ATTACHEDDEVICEPAGELENGTH value.

When the memory device does not support native-wrapping burst, there is usually no difference in behavior between a fixed burst length mode and a continuous burst mode configuration (except for a potential power increase from a memory-speculative data prefetch in a continuous burst read). However, even though continuous burst mode is compatible with GPMC behavior, because the GPMC access engine issues only fixed-length burst and does not benefit from continuous burst mode, it is best to configure the memory device in fixed-length burst mode.

The memory device maximum-length burst (configured in fixed-length burst wrap or nonwrap mode) usually corresponds to the memory device data buffer size. Memory devices with a minimum of 16 half-word buffers are the most appropriate (especially with wrap support), but memory devices with smaller buffer size (4 or 8) are also supported, assuming that the GPMC\_CONFIG1\_i[24-23] ATTACHEDDEVICEPAGELENGTH field is set accordingly to 4 or 8 words.

The device system issues only requests with addresses or starting addresses for nonwrapping burst requests; that is, the request size boundary is aligned. In case of an eight-word-wrapping burst, the wrapping address always occurs on the eight-words boundary. As a consequence, all words requested must be available from the memory data buffer when the buffer size is equal to or greater than the ATTACHEDDEVICEPAGELENGTH value. This usually means that data can be read from or written to the buffer at a constant rate (number of cycles between data) without wait states between data accesses. If the memory does not behave this way (nonzero wait state burstable memory), wait-pin monitoring must be enabled to dynamically control data-access completion within the burst.

When the system burst request length is less than the ATTACHEDDEVICEPAGELENGTH value, the GPMC proceeds with the required accesses.

#### 7.1.3.3.11 pSRAM Access Specificities

pSRAM devices are SRAM-pin-compatible low-power memories that contain a self-refreshed DRAM memory array. The GPMC\_CONFIG1\_i[[11-10] DEVICETYPE field shall be cleared to 0b00.

The pSRAM devices uses the NOR protocol. It support the following operations:

- Asynchronous single read
- Asynchronous page read
- Asynchronous single write
- Synchronous single read and write
- Synchronous burst read
- Synchronous burst write (not supported by NOR Flash memory)

pSRAM devices must be powered up and initialized in a predefined manner according to the specifications of the attached device.

pSRAM devices can be programmed to use either mode: fixed or variable latency. pSRAM devices can either automatically schedule autorefresh operations, which force the GPMC to use its WAIT signal capability when read or write operations occur during an internal self-refresh operation, or pSRAM devices automatically include the autorefresh operation in the access time. These devices do not require additional WAIT signal capability or a minimum CSn high pulse width between consecutive accesses to ensure that the correct internal refresh operation is scheduled.

#### 7.1.3.3.12 NAND Access Description

NAND (8-bit and 16-bit) memory devices using a standard NAND asynchronous address/data-multiplexing scheme can be supported on any chip-select with the appropriate asynchronous configuration settings

As for any other type of memory compatible with the GPMC interface, accesses to a chip-select allocated to a NAND device can be interleaved with accesses to chip-selects allocated to other external devices. This interleaved capability limits the system to *chip enable don't care* NAND devices, because the chip-select allocated to the NAND device must be de-asserted if accesses to other chip-selects are requested.

##### 7.1.3.3.12.1 NAND Memory Device in Byte or 16-Bit Word Stream Mode

NAND devices require correct command and address programming before data array read or write accesses. The GPMC does not include specific hardware to translate a random address system request into a NAND-specific multiphase access. In that sense, GPMC NAND support, as opposed to random memory-map device support, is data-stream-oriented (byte or 16-bit word).

The GPMC NAND programming model relies on a software driver for address and command formatting with the correct data address pointer value according to the block and page structure. Because of NAND structure and protocol interface diversity, the GPMC does not support automatic command and address phase programming, and software drivers must access the NAND device ID to ensure that correct command and address formatting are used for the identified device.

NAND device data read and write accesses are achieved through an asynchronous read or write access. The associated chip-select signal timing control must be programmed according to the NAND device timing specification.

Any chip-select region can be qualified as a NAND region to constrain the ADV<sub>n</sub>\_ALE signal as Address Latch Enable (ALE active high, default state value at low) during address program access, and the BE0<sub>n</sub>\_CLE signal as Command Latch Enable (CLE active high, default state value at low) during command program access. GPMC address lines are not used (the previous value is not changed) during NAND access.

#### 7.1.3.3.12.1.1 *Chip-Select Configuration for NAND Interfacing in Byte or Word Stream Mode*

The GPMC\_CONFIG7<sub>i</sub> register associated with a NAND device region interfaced in byte or word stream mode can be initialized with a minimum size of 16 Mbytes, because any address location in the chip-select memory region can be used to access a NAND data array. The NAND Flash protocol specifies an address sequence where address bits are passed through the data bus in a series of write accesses with the ALE pin asserted. After this address phase, all operations are streamed and the system requests address is irrelevant.

To allow correct command, address, and data-access controls, the GPMC\_CONFIG1<sub>i</sub> register associated with a NAND device region must be initialized in asynchronous read and write modes with the parameters shown in [Table 7-11](#). Failure to comply with these settings corrupts the NAND interface protocol.

The GPMC\_CONFIG1<sub>i</sub> to GPMC\_CONFIG4<sub>i</sub> register associated with a NAND device region must be initialized with the correct control-signal timing value according to the NAND device timing parameters.

**Table 7-11. Chip-Select Configuration for NAND Interfacing**

Bit Field	Register	Value	Comments
WRAPBURST	GPMC_CONFIG1 <sub>i</sub>	0	No wrap
READMULTIPLE	GPMC_CONFIG1 <sub>i</sub>	0	Single access
READTYPE	GPMC_CONFIG1 <sub>i</sub>	0	Asynchronous mode
WRITEMULTIPLE	GPMC_CONFIG1 <sub>i</sub>	0	Single access
WRITETYPE	GPMC_CONFIG1 <sub>i</sub>	0	Asynchronous mode
CLKACTIVATIONTIME	GPMC_CONFIG1 <sub>i</sub>	0b00	
ATTACHEDDEVICEPAGELENGTH	GPMC_CONFIG1 <sub>i</sub>	Don't care	Single-access mode
WAITREADMONITORING	GPMC_CONFIG1 <sub>i</sub>	0	Wait not monitored by GPMC access engine
WAITWRITEMONITORING	GPMC_CONFIG1 <sub>i</sub>	0	Wait not monitored by GPMC access engine
WAITMONITORINGTIME	GPMC_CONFIG1 <sub>i</sub>	Don't care	Wait not monitored by GPMC access engine
WAITPINSELECT	GPMC_CONFIG1 <sub>i</sub>		Select which wait is monitored by edge detectors
DEVICESIZE	GPMC_CONFIG1 <sub>i</sub>	0b00 or 0b01	8- or 16-bit interface
DEVICETYPE	GPMC_CONFIG1 <sub>i</sub>	0b10	NAND device in stream mode
MUXADDDATA	GPMC_CONFIG1 <sub>i</sub>	0b00	Nonmultiplexed mode
TIMEPARAGRANULARITY	GPMC_CONFIG1 <sub>i</sub>	0	Timing achieved with best GPMC clock granularity
GPMCCLKDIVIDER	GPMC_CONFIG1 <sub>i</sub>	Don't care	Asynchronous mode

#### 7.1.3.3.12.1.2 *NAND Device Command and Address Phase Control*

NAND devices require multiple address programming phases. The MPU software driver is responsible for issuing the correct number of command and address program accesses, according to the device command set and the device address-mapping scheme.

NAND device-command and address-phase programming is achieved through write requests to the GPMC\_NAND\_COMMAND<sub>i</sub> and GPMC\_NAND\_ADDRESS<sub>i</sub> register locations with the correct command and address values. These locations are mapped in the associated chip-select register region. The associated chip-select signal timing control must be programmed according to the NAND device timing specification.

Command and address values are not latched during the access and cannot be read back at the register location.

- Only write accesses must be issued to these locations, but the GPMC does not discard any read access. Accessing a NAND device with OEn and CLE or ALE asserted (read access) can produce undefined results.
- Write accesses to the GPMC\_NAND\_COMMAND\_i register location and to the GPMC\_NAND\_ADDRESS\_i register location must be posted for faster operations. The GPMC\_CONFIG[0] NANDFORCEPOSTEDWRITE bit enables write accesses to these locations as posted, even if they are defined as nonposted.

A write buffer is used to store write transaction information before the external device is accessed:

- Up to eight consecutive posted write accesses can be accepted and stored in the write buffer.
- For nonposted write, the pipeline is one deep.
- A GPMC\_STATUS[0] EMPTYWRITEBUFFERSTATUS bit stores the empty status of the write buffer.

The GPMC\_NAND\_COMMAND\_i and GPMC\_NAND\_ADDRESS\_i registers are 32-bit word locations, which means any 32-bit word or 16-bit word access is split into 4- or 2-byte accesses if an 8-bit wide NAND device is attached. For multiple-command phase or multiple-address phase, the software driver can use 32-bit word or 16-bit word access to these registers, but it must account for the splitting and little-endian ordering scheme. When only one byte command or address phase is required, only byte write access to a GPMC\_NAND\_COMMAND\_i and GPMC\_NAND\_ADDRESS\_i can be used, and any of the four byte locations of the registers are valid.

The same applies to GPMC\_NAND\_COMMAND\_i and GPMC\_NAND\_ADDRESS\_i 32-bit word write access to a 16-bit wide NAND device (split into two 16-bit word accesses). In the case of a 16-bit word write access, the MSByte of the 16-bit word value must be set according to the NAND device requirement (usually 0). Either 16-bit word location or any one of the four byte locations of the registers is valid

### 7.1.3.3.12.1.3 Command Latch Cycle

Writing data at the GPMC\_NAND\_COMMAND\_i location places the data as the NAND command value on the bus, using a regular asynchronous write access.

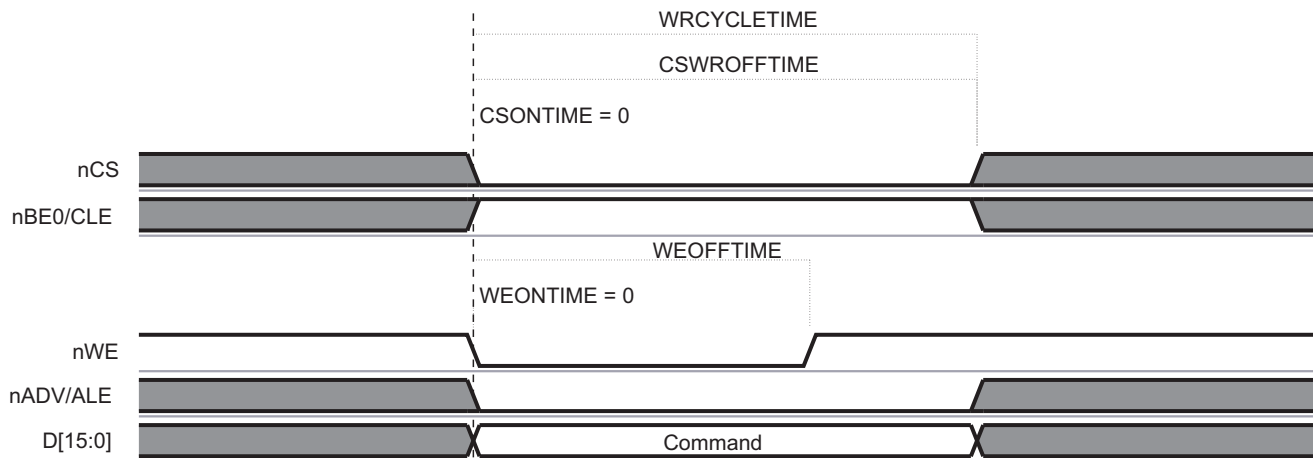

- CSn[j] is controlled by the CSONTIME and CSWROFFTIME timing parameters.
- CLE is controlled by the ADVONTIME and ADVWROFFTIME timing parameters.
- WE is controlled by the WEONTIME and WEOFFTIME timing parameters.
- ALE and REn (OEn) are maintained inactive.

Figure 7-27 shows the NAND command latch cycle.

CLE is shared with the BE0n output signal and has an inverted polarity from BE0n. The NAND qualifier deals with this. During the asynchronous NAND data access cycle, BE0n (also BE1n) must not toggle, because it is shared with CLE.

NAND Flash memories do not use byte enable signals at all.

**Figure 7-27. NAND Command Latch Cycle**

### 7.1.3.3.12.1.4 Address Latch Cycle

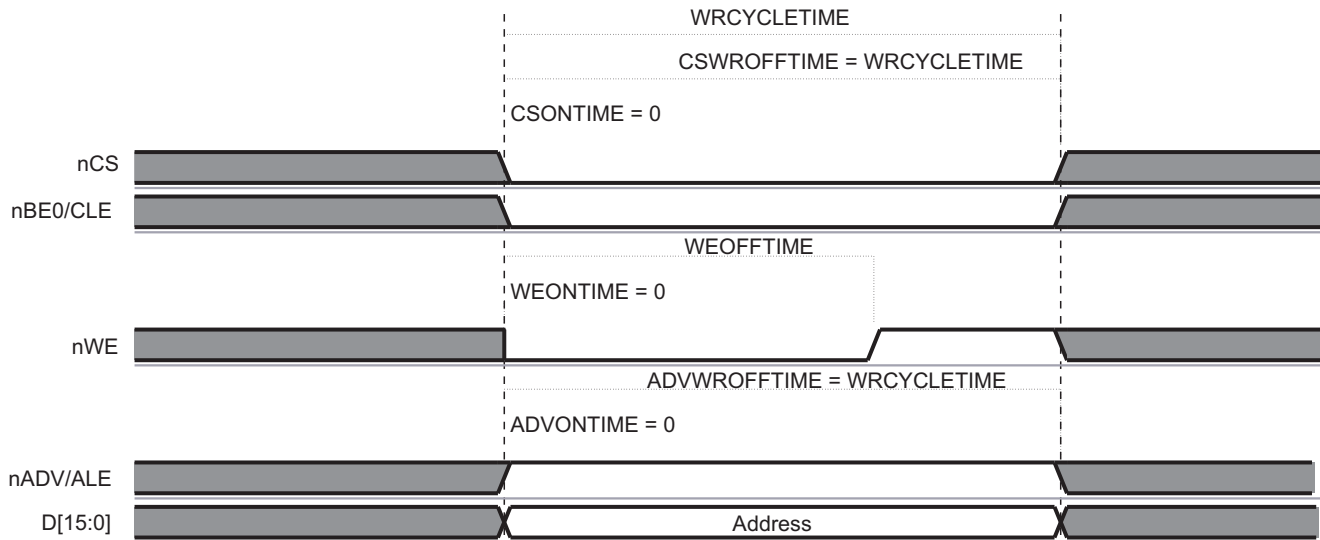

Writing data at the GPMC\_NAND\_ADDRESS\_i location places the data as the NAND partial address value on the bus, using a regular asynchronous write access.

- CSn is controlled by the CSONTIME and CSWROFFTIME timing parameters.
- ALE is controlled by the ADVONTIME and ADVWROFFTIME timing parameters.
- WEn is controlled by the WEONTIME and WEOFFTIME timing parameters.
- CLE and REn (OEn) are maintained inactive.

Figure 7-28 shows the NAND address latch cycle.

ALE is shared with the ADVn output signal and has an inverted polarity from ADVn. The NAND qualifier deals with this. During the asynchronous NAND data access cycle, ALE is kept stable.

**Figure 7-28. NAND Address Latch Cycle**

**7.1.3.3.12.1.5 NAND Device Data Read and Write Phase Control in Stream Mode**

NAND device data read and write accesses are achieved through a read or write request to the chip-select-associated memory region at any address location in the region or through a read or write request to the GPMC\_NAND\_DATA\_i location mapped in the chip-select-associated control register region. GPMC\_NAND\_DATA\_i is not a true register, but an address location to enable REn or WEn signal control. The associated chip-select signal timing control must be programmed according to the NAND device timing specification.

Reading data from the GPMC\_NAND\_DATA\_i location or from any location in the associated chip-select memory region activates an asynchronous read access.

- CSn is controlled by the CSONTIME and CSRDOFFTIME timing parameters.
- REn is controlled by the OEONTIME and OEOFFTIME timing parameters.
- To take advantage of REn high-to-data invalid minimum timing value, the RDACCESSTIME can be set so that data are effectively captured after REn deassertion. This allows optimization of NAND read access cycle time completion. For optimal timing parameter settings, see the NAND device and the device IC timing parameters.

ALE, CLE, and WEn are maintained inactive.

Figure 7-29 shows the NAND data read cycle.

**Figure 7-29. NAND Data Read Cycle**

Writing data to the GPMC\_NAND\_DATA\_i location or to any location in the associated chip-select memory region activates an asynchronous write access.

- CSn is controlled by the CSONTIME and CSWROFFTIME timing parameters.
- WEn is controlled by the WEONTIME and WEOFFTIME timing parameters.
- ALE, CLE, and REn (OEn) are maintained inactive.

Figure 7-30 shows the NAND data write cycle.

**Figure 7-30. NAND Data Write Cycle**

#### 7.1.3.3.12.1.6 NAND Device General Chip-Select Timing Control Requirement

For most NAND devices, read data access time is dominated by CSn-to-data-valid timing and has faster REn-to-data-valid timing. Successive accesses with CSn deassertions between accesses are affected by this timing constraint. Because accesses to a NAND device can be interleaved with other chip-select accesses, there is no certainty that CSn always stays low between two accesses to the same chip-select. Moreover, an CSn deassertion time between the same chip-select NAND accesses is likely to be required as follows: the CSn deassertion requires programming CYCLETIME and RDACCESSTIME according to the CSn-to-data-valid critical timing.

To get full performance from NAND read and write accesses, the prefetch engine can dynamically reduce RDCYCLETIME, WRCYCLETIME, RDACCESSTIME, WRACCESSTIME, CSRDOFFTIME, CSWROFFTIME, ADVRDOFFTIME, ADVWROFFTIME, OEOFFTIME, and WEOFFTIME on back-to-back NAND accesses (to the same memory) and suppress the minimum CSn high pulse width between accesses. For more information about optimal prefetch engine access, see [Section 7.1.3.3.12.4](#).

Some NAND devices require minimum write-to-read idle time, especially for device-status read accesses following status-read command programming (write access). If such write-to-read transactions are used, a minimum CSn high pulse width must be set. For this, CYCLE2CYCLESAMECSEN and CYCLE2CYCLEDELAY must be set according to the appropriate timing requirement to prevent any timing violation.

NAND devices usually have an important REn high to data bus in tristate mode. This requires a bus turnaround setting (BUSTURNAROUND = 1), so that the next access to a different chip-select is delayed until the BUSTURNAROUND delay completes. Back-to-back NAND read accesses to the same NAND Flash are not affected by the programmed bus turnaround delay.

#### 7.1.3.3.12.1.7 Read and Write Access Size Adaptation

##### 7.1.3.3.12.1.7.1 8-Bit Wide NAND Device

Host 16-bit word and 32-bit word read and write access requests to a chip-select associated with an 8-bit wide NAND device are split into successive read and write byte accesses to the NAND memory device. Byte access is ordered according to little-endian organization. A NAND 8-bit wide device must be interfaced on the D0D7 interface bus lane. GPMC data accesses are justified on this bus lane when the chip-select is associated with an 8-bit wide NAND device.

##### 7.1.3.3.12.1.7.2 16-Bit Wide NAND Device

Host 32-bit word read and write access requests to a chip-select associated with a 16-bit wide NAND device are split into successive read and write 16-bit word accesses to the NAND memory device. 16-bit word access is ordered according to little-endian organization.

Host byte read and write access requests to a 16-bit wide NAND device are completed as 16-bit accesses on the device itself, because there is no byte-addressing capability on 16-bit wide NAND devices. This means that the NAND device address pointer is incremented on a 16-bit word basis and not on a byte basis. For a read access, only the requested byte is given back to the host, but the remaining byte is not stored or saved by the GPMC, and the next byte or 16-bit word read access gets the next 16-bit word NAND location. For a write access, the invalid byte part of the 16-bit word is driven to FF, and the next byte or 16-bit word write access programs the next 16-bit word NAND location.

Generally, byte access to a 16-bit wide NAND device should be avoided, especially when ECC calculation is enabled. 8-bit or 16-bit ECC-based computations are corrupted by a byte read to a 16-bit wide NAND device, because the nonrequested byte is considered invalid on a read access (not captured on the external data bus; FF is fed to the ECC engine) and is set to FF on a write access.

Host requests (read/write) issued in the chip-select memory region are translated in successive single or split accesses (read/write) to the attached device. Therefore, incrementing 32-bit burst requests are translated in multiple 32-bit sequential accesses following the access adaptation of the 32-bit to 8- or 16-bit device.

#### **7.1.3.3.12.2 NAND Device-Ready Pin**

The NAND memory device provides a ready pin to indicate data availability after a block/page opening and to indicate that data programming is complete. The ready pin can be connected to one of the WAIT GPMC input pins; data read accesses must not be tried when the ready pin is sampled inactive (device is not ready) even if the associated chip-select WAITREADMONITORING bit field is set. The duration of the NAND device busy state after the block/page opening is so long (up to 50  $\mu$ s) that accesses occurring when the ready pin is sampled inactive can stall GPMC access and eventually cause a system time-out.

If a read access to a NAND flash is done using the wait monitoring mode, the device is blocked during a page opening, and so is the GPMC. If the correct settings are used, other chip-selects can be used while the memory processes the page opening command.

To avoid a time-out caused by a block/page opening delay in NAND flash, disable the wait pin monitoring for read and write accesses (that is, set the GPMC\_CONFIG1\_i[[21] WAITWRITEMONITORING and GPMC\_CONFIG1\_i[[22] WAITREADMONITORING bits to 0 and use one of the following methods instead:

- Use software to poll the WAITnSTATUS bit ( $n = 0$  to 1) of the GPMC\_STATUS register.
- Configure an interrupt that is generated on the WAIT signal change (through the GPMC\_IRQENABLE [11-8]bits).

Even if the READWAITMONITORING bit is not set, the external memory nR/B pin status is captured in the programmed WAIT bit in the GPMC\_STATUS register.

The READWAITMONITORING bit method must be used for other memories than NAND flash, if they require the use of a WAIT signal.

##### **7.1.3.3.12.2.1 Ready Pin Monitored by Software Polling**

The ready signal state can be monitored through the GPMC\_STATUS WAITxSTATUS bit ( $x = 0$  or 1). The software must monitor the ready pin only when the signal is declared valid. Refer to the NAND device timing parameters to set the correct software temporization to monitor ready only after the invalid window is complete from the last read command written to the NAND device.

##### **7.1.3.3.12.2.2 Ready Pin Monitored by Hardware Interrupt**

Each gpmc\_wait input pin can generate an interrupt when a wait-to-no-wait transition is detected. Depending on whether the GPMC\_CONFIG WAITxPINPOLARITY bits ( $x = 0$  or 1) is active low or active high, the wait-to-no-wait transition is a low-to-high external WAIT signal transition or a high-to-low external WAIT signal transition, respectively.

The wait transition pin detector must be cleared before any transition detection. This is done by writing 1 to the WAITxEDGEDETECTIONSTATUS bit ( $x = 0$  or  $1$ ) of the GPMC\_IRQSTATUS register according to the gpmc\_wait pin used for the NAND device-ready signal monitoring. To detect a wait-to-no-wait transition, the transition detector requires a wait active time detection of a minimum of two GPMC\_FCLK cycles. Software must incorporate precautions to clear the wait transition pin detector before wait (busy) time completes.

A wait-to-no-wait transition detection can issue a GPMC interrupt if the WAITxEDGEDETECTIONENABLE bit in the GPMC\_IRQENABLE register is set and if the WAITxEDGEDETECTIONSTATUS bit field in the GPMC\_IRQSTATUS register is set.

The WAITMONITORINGTIME field does not affect wait-to-no-wait transition time detection.

It is also possible to poll the WAITxEDGEDETECTIONSTATUS bit field in the GPMC\_IRQSTATUS register according to the gpmc\_wait pin used for the NAND device ready signal monitoring.

### 7.1.3.3.12.3 ECC Calculator

The General Purpose Memory Controller includes an Error Code Correction (ECC) calculator circuitry that enables on the fly ECC calculation during data read or data program (that is, write) operations. The page size supported by the ECC calculator in one calculation/context is 512 bytes.

The user can choose from two different algorithms with different error correction capabilities through the GPMC\_ECC\_CONFIG[16] ECCALGORITHM bit:

- Hamming code for 1-bit error code correction on 8- or 16-bit NAND Flash organized with page size greater than 512 bytes
- BCH (Bose-Chaudhuri-Hocquenghem) code for 4- to 16-bit error correction

The GPMC does not directly handle the error code correction itself. During writes, the GPMC computes parity bits. During reads, the GPMC provides enough information for the processor to correct errors without reading the data buffer all over again.

The Hamming code ECC is based on a 2-dimensional (row and column) bit parity accumulation. This parity accumulation is either accomplished on the programmed number of bytes or 16-bit words read from the memory device, or written to the memory device in stream mode.

Because the ECC engine includes only one accumulation context, it can be allocated to only one chip-select at a time through the GPMC\_ECC\_CONFIG[3-1] ECCCS bit field. Even if two CS use different ECC algorithms, one the Hamming code and the other a BCH code, they must define separate ECC contexts because some of the ECC registers are common to all types of algorithms.

#### 7.1.3.3.12.3.1 Hamming Code

All references to Error Code Correction (ECC) in this subsection refer to the 1-bit error correction Hamming code.

The ECC is based on a two-dimensional (row and column) bit parity accumulation known as Hamming Code. The parity accumulation is done for a programmed number of bytes or 16-bit word read from the memory device or written to the memory device in stream mode.

There is no automatic error detection or correction, and it is the software NAND driver responsibility to read the multiple ECC calculation results, compare them to the expected code value, and take the appropriate corrective actions according to the error handling strategy (ECC storage in spare byte, error correction on read, block invalidation).

The ECC engine includes a single accumulation context. It can be allocated to a single designated chip-select at a time and parallel computations on different chip-selects are not possible. Since it is allocated to a single chip-select, the ECC computation is not affected by interleaved GPMC accesses to other chip-selects and devices. The ECC accumulation is sequentially processed in the order of data read from or written to the memory on the designated chip-select. The ECC engine does not differentiate read accesses from write accesses and does not differentiate data from command or status information. It is the software responsibility to make sure only relevant data are passed to the NAND flash memory while the ECC computation engine is active.

The starting NAND page location must be programmed first, followed by an ECC accumulation context reset with an ECC enabling, if required. The NAND device accesses discussed in the following sections must be limited to data read or write until the specified number of ECC calculations is completed.

#### **7.1.3.3.12.3.1.1 ECC Result Register and ECC Computation Accumulation Size**

The GPMC includes up to nine ECC result registers (GPMC\_ECCj\_RESULT, j = 1 to 9) to store ECC computation results when the specified number of bytes or 16-bit words has been computed.

The ECC result registers are used sequentially; one ECC result is stored in one ECC result register on the list, the next ECC result is stored in the next ECC result register on the list, and so forth, until the last ECC computation. The value of the GPMC\_ECCj\_RESULT register value is valid only when the programmed number of bytes or 16-bit words has been accumulated, which means that the same number of bytes or 16-bit words has been read from or written to the NAND device in sequence.

The GPMC\_ECC\_CONTROL[3-0] ECCPOINTER field must be set to the correct value to select the ECC result register to be used first in the list for the incoming ECC computation process. The ECCPointer can be read to determine which ECC register is used in the next ECC result storage for the ongoing ECC computation. The value of the GPMC\_ECCj\_RESULT register (j = 1 to 9) can be considered valid when ECCPOINTER equals j + 1. When the GPMC\_ECCj\_RESULT (where j = 9) is updated, ECCPOINTER is frozen at 10, and ECC computing is stopped (ECCENABLE = 0).

The ECC accumulator must be reset before any ECC computation accumulation process. The GPMC\_ECC\_CONTROL[8] ECCCLEAR bit must be set to 1 (nonpersistent bit) to clear the accumulator and all ECC result registers.

For each ECC result (each register, j = 1 to 9), the number of bytes or 16-bit words used for ECC computing accumulation can be selected from between two programmable values.

The ECCjRESULTSIZES bits (j = 1 to 9) in the GPMC\_ECC\_SIZE\_CONFIG register select which programmable size value (ECCSIZE0 or ECCSIZE1) must be used for this ECC result (stored in GPMC\_ECCj\_RESULT register).

The ECCSIZE0 and ECCSIZE1 fields allow selection of the number of bytes or 16-bit words used for ECC computation accumulation. Any even values from 2 to 512 are allowed.

Flexibility in the number of ECCs computed and the number of bytes or 16-bit words used in the successive ECC computations enables different NAND page error-correction strategies. Usually based on 256 or 512 bytes and on 128 or 256 16-bit word, the number of ECC results required is a function of the NAND device page size. Specific ECC accumulation size can be used when computing the ECC on the NAND spare byte.

For example, with a 2 Kbyte data page 8-bit wide NAND device, eight ECCs accumulated on 256 bytes can be computed and added to one extra ECC computed on the 24 spare bytes area where the eight ECC results used for comparison and correction with the computed data page ECC are stored. The GPMC then provides nine GPMC\_ECCj\_RESULT registers (j= 1 to 9) to store the results. In this case, ECCSIZE0 is set to 256, and ECCSIZE1 is set to 24; the ECC[1-8]RESULTSIZES bits are cleared to 0, and the ECC9RESULTSIZES bit is set to 1.

#### **7.1.3.3.12.3.1.2 ECC Enabling**

The GPMC\_ECC\_CONFIG[3-1] ECCCS field selects the allocated chip-select. The GPMC\_ECC\_CONFIG[0] ECCENABLE bit enables ECC computation on the next detected read or write access to the selected chip-select.

The ECCPOINTER, ECCCLEAR, ECCSIZE, ECCjRESULTSIZES (where j = 1 to 9), ECC16B, and ECCCS fields must not be changed or cleared while an ECC computation is in progress.

The ECC accumulator and ECC result register must not be changed or cleared while an ECC computation is in progress.

[Table 7-12](#) describes the ECC enable settings.

Table 7-12. ECC Enable Settings

Bit Field	Register	Value	Comments
ECCCS	GPMC_ECC_CONFIG	0-3h	Selects the chip-select where ECC is computed
ECC16B	GPMC_ECC_CONFIG	0/1	Selects column number for ECC calculation
ECCCLEAR	GPMC_ECC_CONTROL	0-7h	Clears all ECC result registers
ECCPOINTER	GPMC_ECC_CONTROL	0-7h	A write to this bit field selects the ECC result register where the first ECC computation is stored. Set to 1 by default.
ECCSIZE1	GPMC_ECC_SIZE_CONFIG	0-FFh	Defines ECCSIZE1
ECCSIZE0	GPMC_ECC_SIZE_CONFIG	0-FFh	Defines ECCSIZE0
ECCjRESULTSIZE (j from 1 to 9)	GPMC_ECC_SIZE_CONFIG	0/1	Selects the size of ECCn result register
ECCENABLE	GPMC_ECC_CONFIG	1	Enables the ECC computation

7.1.3.3.12.3.1.3 ECC Computation

The ECC algorithm is a multiple parity bit accumulation computed on the odd and even bit streams extracted from the byte or Word 16 streams. The parity accumulation is split into row and column accumulations, as shown in Figure 7-31 and Figure 7-32. The intermediate row and column parities are used to compute the upper level row and column parities. Only the final computation of each parity bit is used for ECC comparison and correction.

P1o = bit7 XOR bit5 XOR bit3 XOR bit1 on each byte of the data stream

P1e = bit6 XOR bit4 XOR bit2 XOR bit0 on each byte of the data stream

P2o = bit7 XOR bit6 XOR bit3 XOR bit2 on each byte of the data stream

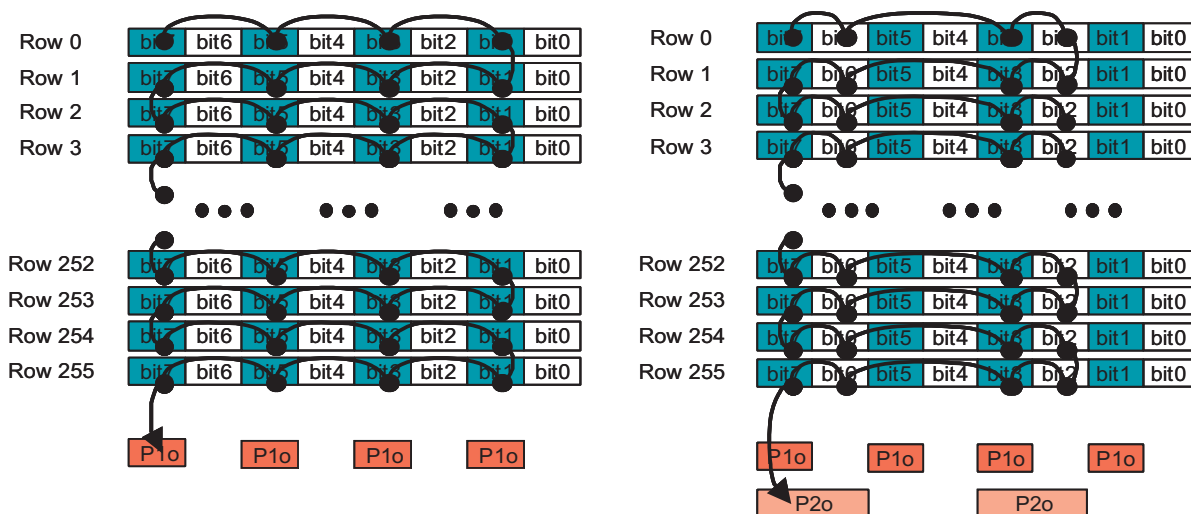

P2e = bit5 XOR bit4 XOR bit1 XOR bit0 on each byte of the data stream

P4o = bit7 XOR bit6 XOR bit5 XOR bit4 on each byte of the data stream

P4e = bit3 XOR bit2 XOR bit1 XOR bit0 on each byte of the data stream

Each column parity bit is XORed with the previous accumulated value.

Figure 7-31. Hamming Code Accumulation Algorithm (1 of 2)

For line parities, the bits of each new data are XORed together, and line parity bits are computed as:

$$P8e = \text{row0 XOR row2 XOR row4 XOR ... XOR row254}$$

$$P8o = \text{row1 XOR row3 XOR row5 XOR ... XOR row255}$$

$$P16e = \text{row0 XOR row1 XOR row4 XOR row5 XOR ... XOR row252 XOR row 253}$$

$$P16o = \text{row2 XOR row3 XOR row6 XOR row7 XOR ... XOR row254 XOR row 255}$$

Unused parity bits in the result registers are cleared to 0.

Figure 7-32. Hamming Code Accumulation Algorithm (2 of 2)

Figure 7-33 shows ECC computation for a 256-byte data stream (read or write). The result includes six column parity bits (P1o-P2o-P4o for odd parities, and P1e-P2e-P4e for even parities) and sixteen row parity bits (P8o-P16o-P32o--P1024o for odd parities, and P8e-P16e-P32e--P1024e for even parities).

Figure 7-33. ECC Computation for a 256-Byte Data Stream (Read or Write)

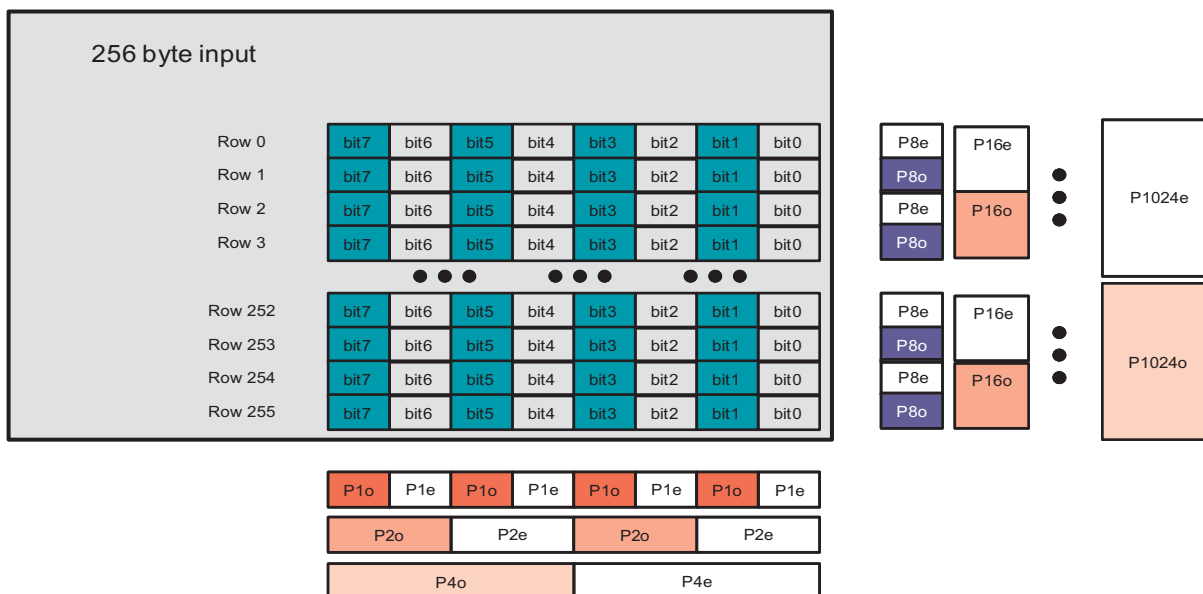

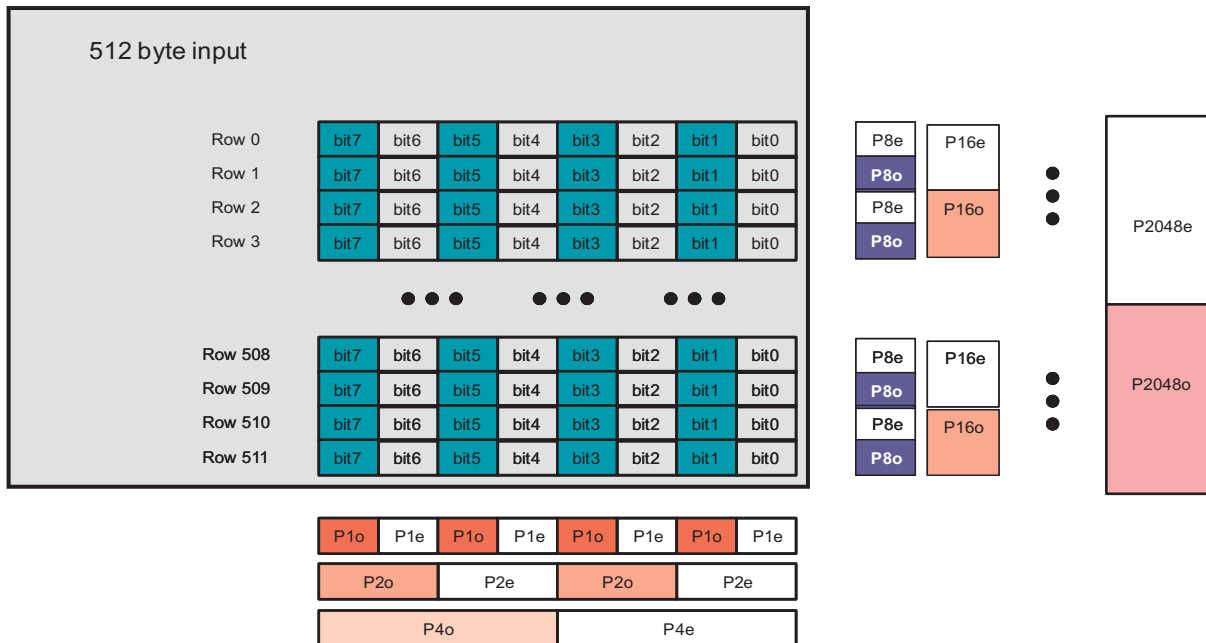

Figure 7-34 shows ECC computation for a 512-byte data stream (read or write). The result includes six column parity bits (P1o-P2o-P4o for odd parities, and P1e-P2e-P4e for even parities) and eighteen row parity bits (P8o-P16o-P32o--P1024o- - P2048o for odd parities, and P8e-P16e-P32e--P1024e- P2048e for even parities).

For a 2 Kbytes page, four 512 bytes ECC calculations plus one for the spare area are required. Results are stored in the GPMC\_ECCj\_RESULT registers (j = 1 to 9).

Figure 7-34. ECC Computation for a 512-Byte Data Stream (Read or Write)

**7.1.3.3.12.3.1.4 ECC Comparison and Correction**

To detect an error, the computed ECC result must be XORed with the parity value stored in the spare area of the accessed page.

- If the result of this logical XOR is all 0s, no error is detected and the read data is correct.
- If every second bit in the parity result is a 1, one bit is corrupted and is located at bit address (P2048o, P1024o, P512o, P256o, P128o, P64o, P32o, P16o, P8o, P4o, P2o, P1o). The software must correct the corresponding bit.
- If only one bit in the parity result is 1, it is an ECC error and the read data is correct.

**7.1.3.3.12.3.1.5 ECC Calculation Based on 8-Bit Word**

The 8-bit based ECC computation is used for 8-bit wide NAND device interfacing.

The 8-bit based ECC computation can be used for 16-bit wide NAND device interfacing to get backward compatibility on the error-handling strategy used with 8-bit wide NAND devices. In this case, the 16-bit wide data read from or written to the NAND device is fragmented into 2 bytes. According to little-endian access, the least significant bit (LSB) of the 16-bit wide data is ordered first in the byte stream used for 8-bit based ECC computation.

7.1.3.3.12.3.1.6 ECC Calculation Based on 16-Bit Word

ECC computation based on a 16-bit word is used for 16-bit wide NAND device interfacing. This ECC computation is not supported when interfacing an 8-bit wide NAND device, and the GPMC\_ECC\_CONFIG[7] ECC16B bit must be cleared to 0 when interfacing an 8-bit wide NAND device.

The parity computation based on 16-bit words affects the row and column parity mapping. The main difference is that the odd and even parity bits P8o and P8e are computed on rows for an 8-bit based ECC while there are computed on columns for a 16-bit based ECC. Figure 7-35 and Figure 7-36.

Figure 7-35. 128 Word16 ECC Computation

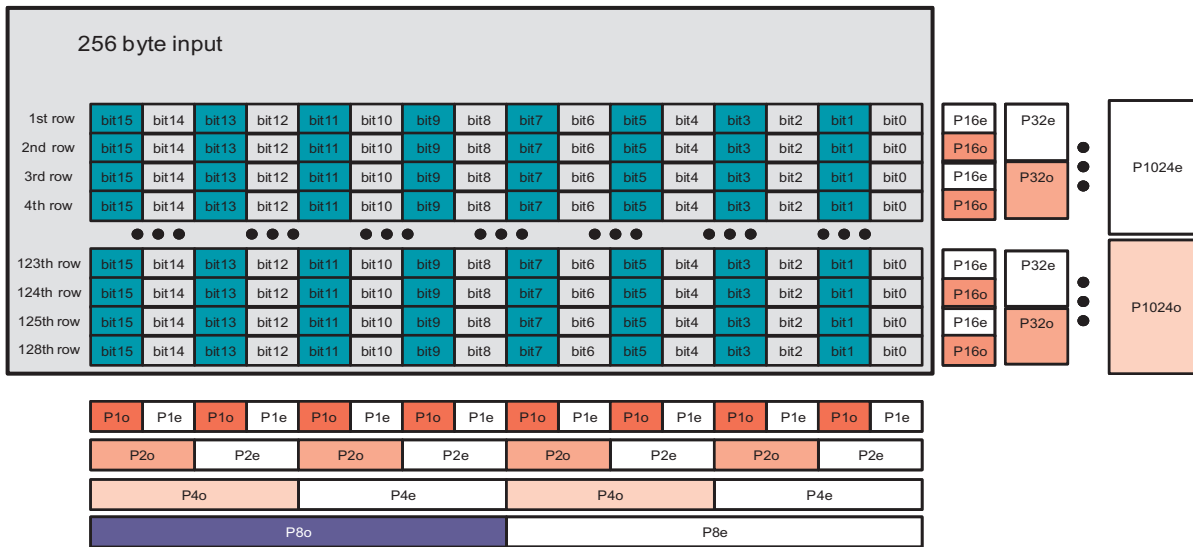

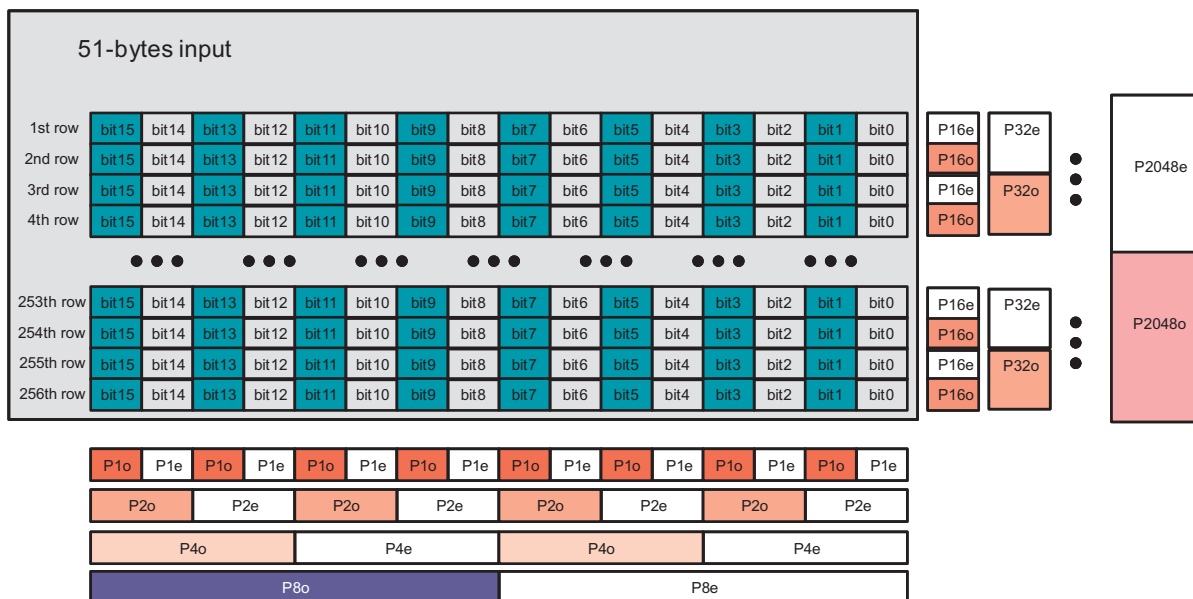

Figure 7-36. 256 Word16 ECC Computation

### 7.1.3.3.12.3.2 BCH Code (Bose-Chaudhuri-Hocquenghem)

All references to Error Code Correction (ECC) in this subsection refer to the 4- to 16-bit error correction BCH code.

#### 7.1.3.3.12.3.2.1 Requirements

Read and write accesses to a NAND flash take place by whole pages, in a predetermined sequence: first the data byte page itself, then some spare bytes, including the BCH ECC (and other information). The NAND IC can cache a full page, including spares, for read and write accesses.

Typical page write sequence:

- Sequential write to NAND cache of main data + spare data, for a page. ECC is calculated on the fly. Calculated ECC may be inserted on the fly in the spares, or replaced by dummy accesses.
- When the calculated ECC is replaced by dummy accesses, it must be written to the cache in a second, separate phase. The ECC module is disabled during that time.
- NAND writes its cache line (page) to the array

Typical page read sequence:

- Sequential read of a page. ECC is calculated on the fly.
- ECC module buffers status determines the presence of errors.
- Accesses to several memories may be interleaved by the GPMC, but only one of those memories can be a NAND using the BCH engine at a time; in other words, only one BCH calculation (for example, for a single page) can be on-going at any time. Note also that the sequential nature of NAND accesses guarantees that the data is always written / read out in the same order. BCH-relevant accesses are selected by the GPMCs chip-select.
- Each page may hold up to 4 Kbytes of data, spare bytes not included. This means up to 8 x 512-byte BCH messages. Since all the data is written / read out first, followed by the BCH ECC, this means that the BCH engine must be able to hold 8 104-bit remainders or syndromes (or smaller, 52-bit ones) at the same time.

The BCH module has the capacity to store all remainders internally. After the page start, an internal counter is used to detect the 512-byte sector boundaries. On those boundaries, the current remainder is stored and the divider reset for the next calculation. At the end of the page, the BCH module contains all remainders.

- NAND access cycles hold 8 or 16 bits of data each (1 or 2 bytes); Each NAND cycle takes at least 4 cycles of the GPMCs internal clock. This means the NAND flash timing parameters must define a RDCYCLETIME and a WRCYCLETIME of at least 4 clock cycles after optimization when using the BCH calculator.
- The spare area is assumed to be large enough to hold the BCH ECC, that is, to have at least a message of 13 bytes available per 512-byte sector of data. The zone of unused spare area by the ECC may or may not be protected by the same ECC scheme, by extending the BCH message beyond 512 bytes (maximum codeword is 1023-byte long, ECC included, which leaves a lot of space to cover some spares bytes).

### 7.1.3.3.12.3.2.2 Memory-Mapping of the BCH Codeword

BCH encoding considers a block of data to protect as a polynomial message  $M(x)$ . In our standard case, 512 bytes of data (that is, 2 bits = 4096 bits) are seen as a polynomial of degree  $2 - 1 = 4095$ , with parameters ranging from  $M_0$  to  $M_{4095}$ . For 512 bytes of data, 52 bits are required for 4-bit error correction, and 104 bits are required for 8-bit error correction and 207 bits are required for 16-bit error correction. The ECC is a remainder polynomial  $R(x)$  of degree 103 (or 51, depending on the selected mode). The complete codeword  $C(x)$  is the concatenation of  $M(x)$  and  $R(x)$  as shown in [Table 7-13](#).

**Table 7-13. Flattened BCH Codeword Mapping (512 Bytes + 104 Bits)**

Bit number	Message $M(x)$	ECC $R(x)$				
	$M_{4095}$	...	$M_0$	$R_{103}$	...	$R_0$

If the message is extended by the addition of spare bytes to be protected by the same ECC, the principle is still valid. For example, a 3-byte extension of the message gives a polynomial message  $M(x)$  of degree  $((512 + 3) \times 8) - 1 = 4119$ , for a total of  $3 + 13 = 16$  spare bytes of spare, all protected as part of the same codeword.

The message and the ECC bits are manipulated and mapped in the GPMC byte-oriented system. The ECC bits are stored in:

- GPMC\_BCH\_RESULT0\_i
- GPMC\_BCH\_RESULT1\_i
- GPMC\_BCH\_RESULT2\_i
- GPMC\_BCH\_RESULT3\_i

### 7.1.3.3.12.3.2.3 Memory Mapping of the Data Message

The data message mapping shall follow the following rules:

- Bit endianness within a byte is little-endian, that is, the bytes LS bit is also the lowest-degree polynomial parameter: a byte  $b_7$ - $b_0$  (with  $b_0$  the LS bit) represents a segment of polynomial  $b_7 * x + b_6 * x + \dots + b_0 * x$
- The message is mapped in the NAND starting with the highest-order parameters, that is, in the lowest addresses of a NAND page.
- Byte endianness within the NANDs 16-bit words is big endian. This means that the same message mapped in 8- and 16-bit memories has the same content at the same byte address.

The BCH module has no visibility over actual addresses. The most important point is the sequence of data word the BCH sees. However, the NAND page is always scanned incrementally in read and write accesses, and this produces the mapping patterns described in the following.

[Table 7-14](#) and [Table 7-15](#) show the mapping of the same 512-byte vector (typically a BCH message) in the NAND memory space. Note that the byte 'address' is only an offset modulo 512 (200h), since the same page may contain several contiguous 512-byte sectors (BCH blocks). The LSB and MSB are respectively the bits  $M_0$  and  $M_{(2^{12}-1)}$  of the codeword mapping given above. In both cases the data vectors are aligned, that is, their boundaries coincide with the RAMs data word boundaries.

**Table 7-14. Aligned Message Byte Mapping in 8-bit NAND**

Byte Offset	8-Bit Word
0	(msb) Byte 511 (1FFh)
1h	Byte 510 (1FEh)
⋮	⋮
1FFh	Byte 0 (0) (LSB)

**Table 7-15. Aligned Message Byte Mapping in 16-bit NAND**

Byte Offset	16-Bit Words MSB	16-Bit Words LSB
0	Byte 510 (1FEh)	(msb) Byte 511 (1FFh)
2h	Byte 508 (1FCh)	Byte 509 (1FDh)
⋮	⋮	⋮
1FEh	Byte 0 (0)	(lsb) Byte 1 (1)

Table 7-16 and Table 7-17 show the mapping in memory of arbitrarily-sized messages, starting on access (byte or 16-bit word) boundaries for more clarity. Note that message may actually start and stop on arbitrary nibbles. A nibble is a 4-bit entity. The unused nibbles are not discarded, and they can still be used by the BCH module, but as part of the next message section (for example, on another sectors ECC).

**Table 7-16. Aligned Nibble Mapping of Message in 8-bit NAND**

Byte Offset	8-Bit Word	
	4-Bit Most Significant Nibble	4-Bit Less Significant Nibble
1	(MSB) Nibble S-1	Nibble S-2
2	Nibble S-3	Nibble S-4
⋮	⋮	⋮
S/2 - 2	Nibble 3	Nibble 2
S/2 - 1	Nibble 1	Nibble 0 (LSB)

**Table 7-17. Misaligned Nibble Mapping of Message in 8-bit NAND**

Byte Offset	8-Bit Word	
	4-Bit Most Significant Nibble	4-Bit Less Significant Nibble
1	(MSB) Nibble S-1	Nibble S-2
2	Nibble S-3	Nibble S-4
⋮	⋮	⋮
(S+1)/2 - 2	Nibble 2	Nibble 1
(S+1)/2 - 1	Nibble 0 (LSB)	

**Table 7-18. Aligned Nibble Mapping of Message in 16-bit NAND**

Byte Offset	16-Bit Word			
	4-Bit Most Significant Nibble		4-Bit Less Significant Nibble	
0	Nibble S-3	Nibble S-4	(MSB) Nibble S-1	Nibble S-2
2	Nibble S-7	Nibble S-8	Nibble S-5	Nibble S-6
⋮	⋮	⋮	⋮	⋮
S/2 - 4	Nibble 5	Nibble 4	Nibble 7	Nibble 6
S/2 - 2	Nibble 1	Nibble 0 (LSB)	Nibble 3	Nibble 2

**Table 7-19. Misaligned Nibble Mapping of Message in 16-bit NAND (1 Unused Nibble)**

Byte Offset	16-Bit Word			
	4-Bit Most Significant Nibble		4-Bit Less Significant Nibble	
0	Nibble S-3	Nibble S-4	(MSB) Nibble S-1	Nibble S-2
2	Nibble S-7	Nibble S-8	Nibble S-5	Nibble S-6
⋮	⋮	⋮	⋮	⋮
(S+1)/2 - 4	Nibble 4	Nibble 3	Nibble 6	Nibble 5
(S+1)/2 - 2	Nibble 0 (LSB)		Nibble 2	Nibble 1

**Table 7-20. Misaligned Nibble Mapping of Message in 16-bit NAND (2 Unused Nibble)**

Byte Offset	16-Bit Word			
	4-Bit Most Significant Nibble		4-Bit Less Significant Nibble	
0	Nibble S-3	Nibble S-4	(MSB) Nibble S-1	Nibble S-2
2	Nibble S-7	Nibble S-8	Nibble S-5	Nibble S-6
⋮	⋮	⋮	⋮	⋮
(S+2)/2 - 4	Nibble 3	Nibble 2	Nibble 5	Nibble 4
(S+2)/2 - 2			Nibble 1	Nibble 0 (LSB)

**Table 7-21. Misaligned Nibble Mapping of Message in 16-bit NAND (3 Unused Nibble)**

Byte Offset	16-Bit Word			
	4-Bit Most Significant Nibble		4-Bit Less Significant Nibble	
0	Nibble S-3	Nibble S-4	(MSB) Nibble S-1	Nibble S-2
2	Nibble S-7	Nibble S-8	Nibble S-5	Nibble S-6
⋮	⋮	⋮	⋮	⋮
(S+3)/2 - 4	Nibble 2	Nibble 1	Nibble 4	Nibble 3
(S+3)/2 - 2			Nibble 0 (LSB)	

Note that many other cases exist than the ones represented above, for example, where the message does not start on a word boundary.

#### 7.1.3.3.12.3.2.4 Memory Mapping of the ECC

The ECC (or remainder) is presented by the BCH module as a single 104-bit (or 52-bit), little-endian vector. It is up to the software to fetch those 13 bytes (or 6 bytes) from the modules interface, then store them to the NANDs spare area (page write) or to an intermediate buffer for comparison with the stored ECC (page read). There are no constraints on the ECC mapping inside the spare area: it is a softwarecontrolled operation.

However, it is advised to maintain a coherence in the respective formats of the message or the ECC remainder once they have been read out of the NAND. The error correction algorithm works from the complete codeword (concatenated message and remainder) once an error as been detected. The creation of this codeword should be made as straightforward as possible.

There are cases where the same NAND access contains both data and the ECC protecting that data. This is the case when the data/ECC boundary (which can be on any nibble) does not coincide with an access boundary. The ECC is calculated on-the-fly following the write. In that case, the write must also contain part of the ECC because it is impossible to insert the ECC on-the-fly. Instead:

- During the initial page write (BCH encoding), the ECC is replaced by dummy bits. The BCH encoder is by definition turned OFF during the ECC section, so the BCH result is unmodified.
- During a second phase, the ECC is written to the correct location, next to the actual data.
- The completed line buffer is then written to the NAND array.

**7.1.3.3.12.3.2.5 Wrapping Modes**

For a given wrapping mode, the module automatically goes through a specific number of sections, as data is being fed into the module. For each section, the BCH core can be enabled (in which case the data is fed to the BCH divider) or not (in which case the BCH simply counts to the end of the section). When enabled, the data is added to the ongoing calculation for a given sector number (for example, number 0).

Wrapping modes are described below. To get a better understanding and see the real-life read and write sequences implemented with each mode, see [Section 7.1.3.3.12.3.3](#).

For each mode:

- A sequence describes the mode in pseudo-language, with for each section the size and the buffer used for ECC processing (if ON). The programmable lengths are size, size0 and size1.
- A checksum condition is given. If the checksum condition is not respected for a given mode, the modules behavior is unpredictable. S is the number of sectors in the page; size0 and size1 are the section sizes programmed for the mode, in nibbles.

Note that wrapping modes 8, 9, 10, and 11 insert a 1-nibble padding where the BCH processing is OFF. This is intended for t = 4 ECC, where ECC is 6 bytes long and the ECC area is expected to include (at least) 1 unused nibble to remain byte-aligned.

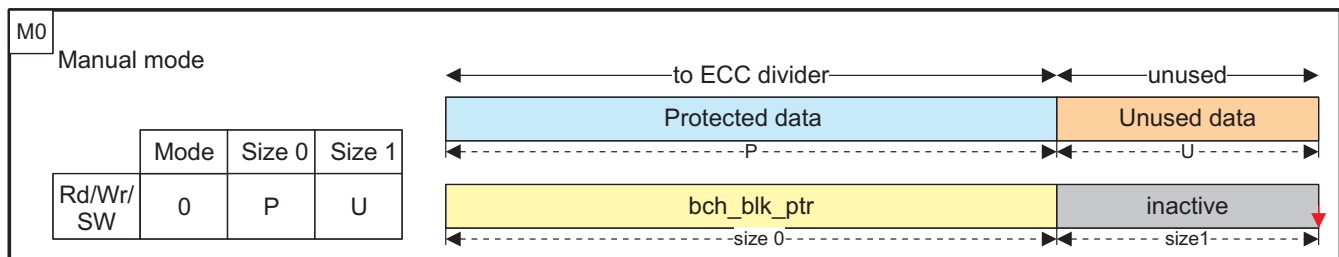

**7.1.3.3.12.3.2.6 Manual Mode (0x0)**

This mode is intended for short sequences, added manually to a given buffer through the software data port input. A complete page may be built out of several such sequences.

To process an arbitrary sequence of 4-bit nibbles, accesses to the software data port shall be made, containing the appropriate data. If the sequence end does not coincide with an access boundary (for example, to process 5 nibbles = 20 bits in 16-bit access mode) and those nibbles need to be skipped, a number of unused nibbles shall be programmed in size1 (in the same example: 5 nibbles to process + 3 to discard = 8 nibbles = exactly 2 x 16-bit accesses: we must program size0 = 5, size1 = 3).

[Figure 7-37](#) shows the manual mode sequence and mapping. In this figure, size and size0 are the same parameter.

**Figure 7-37. Manual Mode Sequence and Mapping**

Section processing sequence:

- One time with buffer
  - size0 nibbles of data, processing ON
  - size1 nibbles of unused data, processing OFF

Checksum: size0 + size1 nibbles must fit in a whole number of accesses.

In the following sections, S is the number of sectors in the page.

#### **7.1.3.3.12.3.2.7 Mode 0x1**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
  - size0 nibbles spare, processing ON
  - size1 nibbles spare, processing OFF

Checksum: Spare area size (nibbles) = S - (size0 + size1)

#### **7.1.3.3.12.3.2.8 Mode 0xA (10)**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
  - size0 nibbles spare, processing ON
  - 1 nibble pad spare, processing OFF
  - size1 nibbles spare, processing OFF

Checksum: Spare area size (nibbles) = S - (size0 + 1 + size1)

#### **7.1.3.3.12.3.2.9 Mode 0x2**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
  - size0 nibbles spare, processing OFF
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = S - (size0 + size1)

#### **7.1.3.3.12.3.2.10 Mode 0x3**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- One time with buffer 0
  - size0 nibbles spare, processing ON
- Repeat with buffer 0 to S-1
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = size0 + (S - size1)

**7.1.3.3.12.3.2.11 Mode 0x7**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- One time with buffer 0
  - size0 nibbles spare, processing ON
- Repeat S times (no buffer used)
  - size1 nibbles spare, processing OFF

Checksum: Spare area size (nibbles) = size0 + (S - size1)

**7.1.3.3.12.3.2.12 Mode 0x8**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- One time with buffer 0
  - size0 nibbles spare, processing ON
- Repeat with buffer 0 to S-1
  - 1 nibble padding spare, processing OFF
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = size0 + (S - (1+size1))

**7.1.3.3.12.3.2.13 Mode 0x4**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- One time (no buffer used)
  - size0 nibbles spare, processing OFF
- Repeat with buffer 0 to S-1
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = size0 + (S - size1)

**7.1.3.3.12.3.2.14 Mode 0x9**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- One time (no buffer used)
  - size0 nibbles spare, processing OFF
- Repeat with buffer 0 to S-1
  - 1 nibble padding spare, processing OFF
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = size0 + (S - (1+size1))

**7.1.3.3.12.3.2.15 Mode 0x5**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
  - size0 nibbles spare, processing ON
- Repeat with buffer 0 to S-1
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = S - (size0 + size1)

**7.1.3.3.12.3.2.16 Mode 0xB (11)**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
  - size0 nibbles spare, processing ON
- Repeat with buffer 0 to S-1
  - 1 nibble padding spare, processing OFF
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = S - (size0 + 1 + size1)

**7.1.3.3.12.3.2.17 Mode 0x6**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
  - size0 nibbles spare, processing ON
- Repeat S times (no buffer used)
  - size1 nibbles spare, processing OFF

Checksum: Spare area size (nibbles) = S - (size0 + size1)

### 7.1.3.3.12.3.3 Supported NAND Page Mappings and ECC Schemes

The following rules apply throughout the entire mapping description:

- Main data area (sectors) size is hardcoded to 512 bytes.
- Spare area size is programmable.
- All page sections (of main area data bytes, protected spare bytes, unprotected spare bytes, and ECC) are defined as explained in [Section 7.1.3.3.12.3.2.3](#).

Each one of the following sections shows a NAND page mapping example (per-sector spare mappings, pooled spare mapping, per-sector spare mapping, with ECC separated at the end of the page).

In the mapping diagrams, sections that belong to the same BCH codeword have the same color (blue or green); unprotected sections are not covered (orange) by the BCH scheme.

Below each mapping diagram, a write (encoding) and read (decoding: syndrome generation) sequence is given, with the number of the active buffers at each point in time (yellow). In the inactive zones (grey), no computing is taking place but the data counter is still active.

In [Figure 7-38](#) to [Figure 7-40](#), tables on the left summarize the mode, size0, size1 parameters to program for respectively write and read processing of a page, with the given mapping, where:

- P is the size of spare byte section Protected by the ECC (in nibbles)
- U is the size of spare byte section Unprotected by the ECC (in nibbles)
- E is the size of the ECC itself (in nibbles)
- S is the number of Sectors per page (2 in the current diagrams)

Each time the processing of a BCH block is complete (ECC calculation for write/encoding, syndrome generation for read/decoding, indicated by red arrows), the update pointer is pulsed. Note that the processing for block 0 can be the first or the last to complete, depending on the NAND page mapping and operation (read or write). All examples show a page size of 1kByte + spares, that is,  $S = 2$  sectors of 512 bytes. The same principles can be extended to larger pages by adding more sectors.

The actual BCH codeword size is used during the error location work to restrict the search range: by definition, errors can only happen in the codeword that was actually written to the NAND, and not in the mathematical codeword of  $n = 2 - 1 = 8191$  bits. That codeword (higher-order bits) is all-zero and implicit during computations.

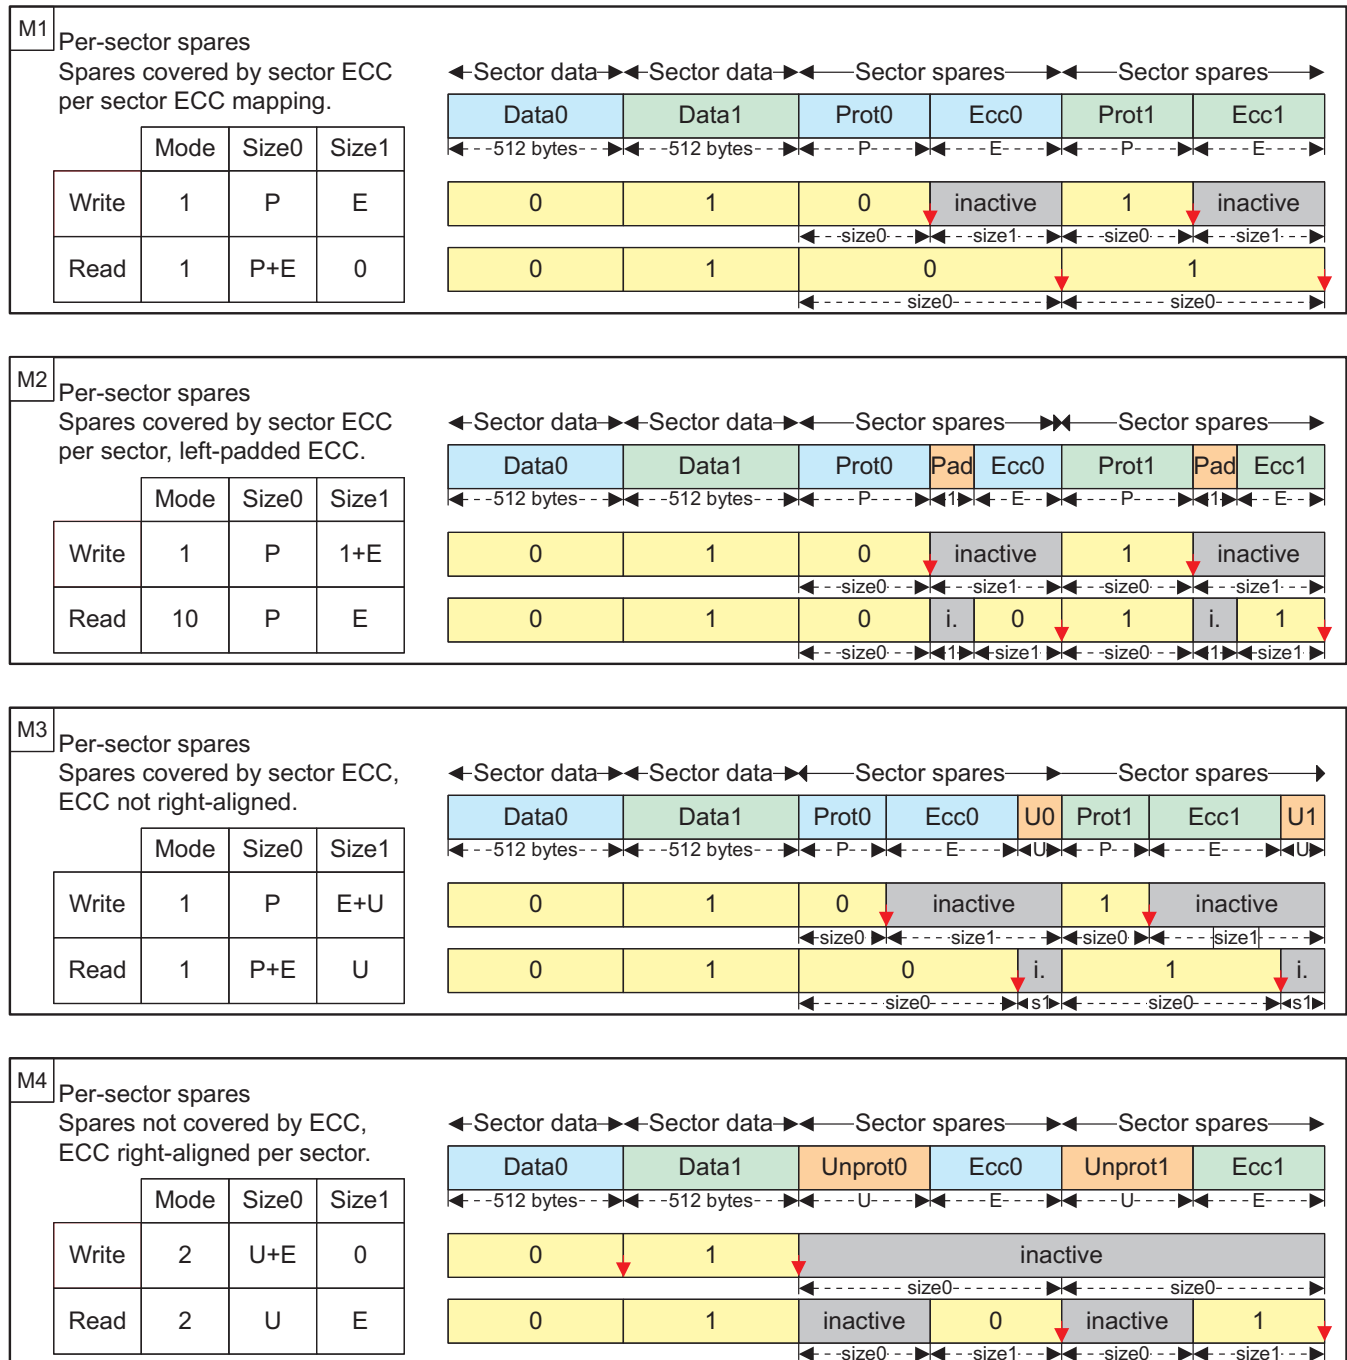

The actual BCH codeword size depends on the mode, on the programmed sizes and on the sector number (all sizes in nibbles):

- Spares mapped and protected per sector ([Figure 7-38](#): see M1-M2-M3-M9-M10):
  - all sectors:  $(512) + P + E$
- Spares pooled and protected by sector 0 ([Figure 7-38](#): see M5-M6):
  - sector 0 codeword:  $(512) + P + E$
  - other sectors:  $(512) + E$
- Unprotected spares ([Figure 7-38](#): see M4-M7-M8-M11-M12):
  - all codewords  $(512) + E$

**7.1.3.3.12.3.3.1 Per-Sector Spare Mappings**

In these schemes (Figure 7-38), each 512-byte sector of the main area has its own dedicated section of the spare area. The spare area of each sector is composed of:

- ECC, which must be located after the data it protects
- other data, which may or may not be protected by the sectors ECC

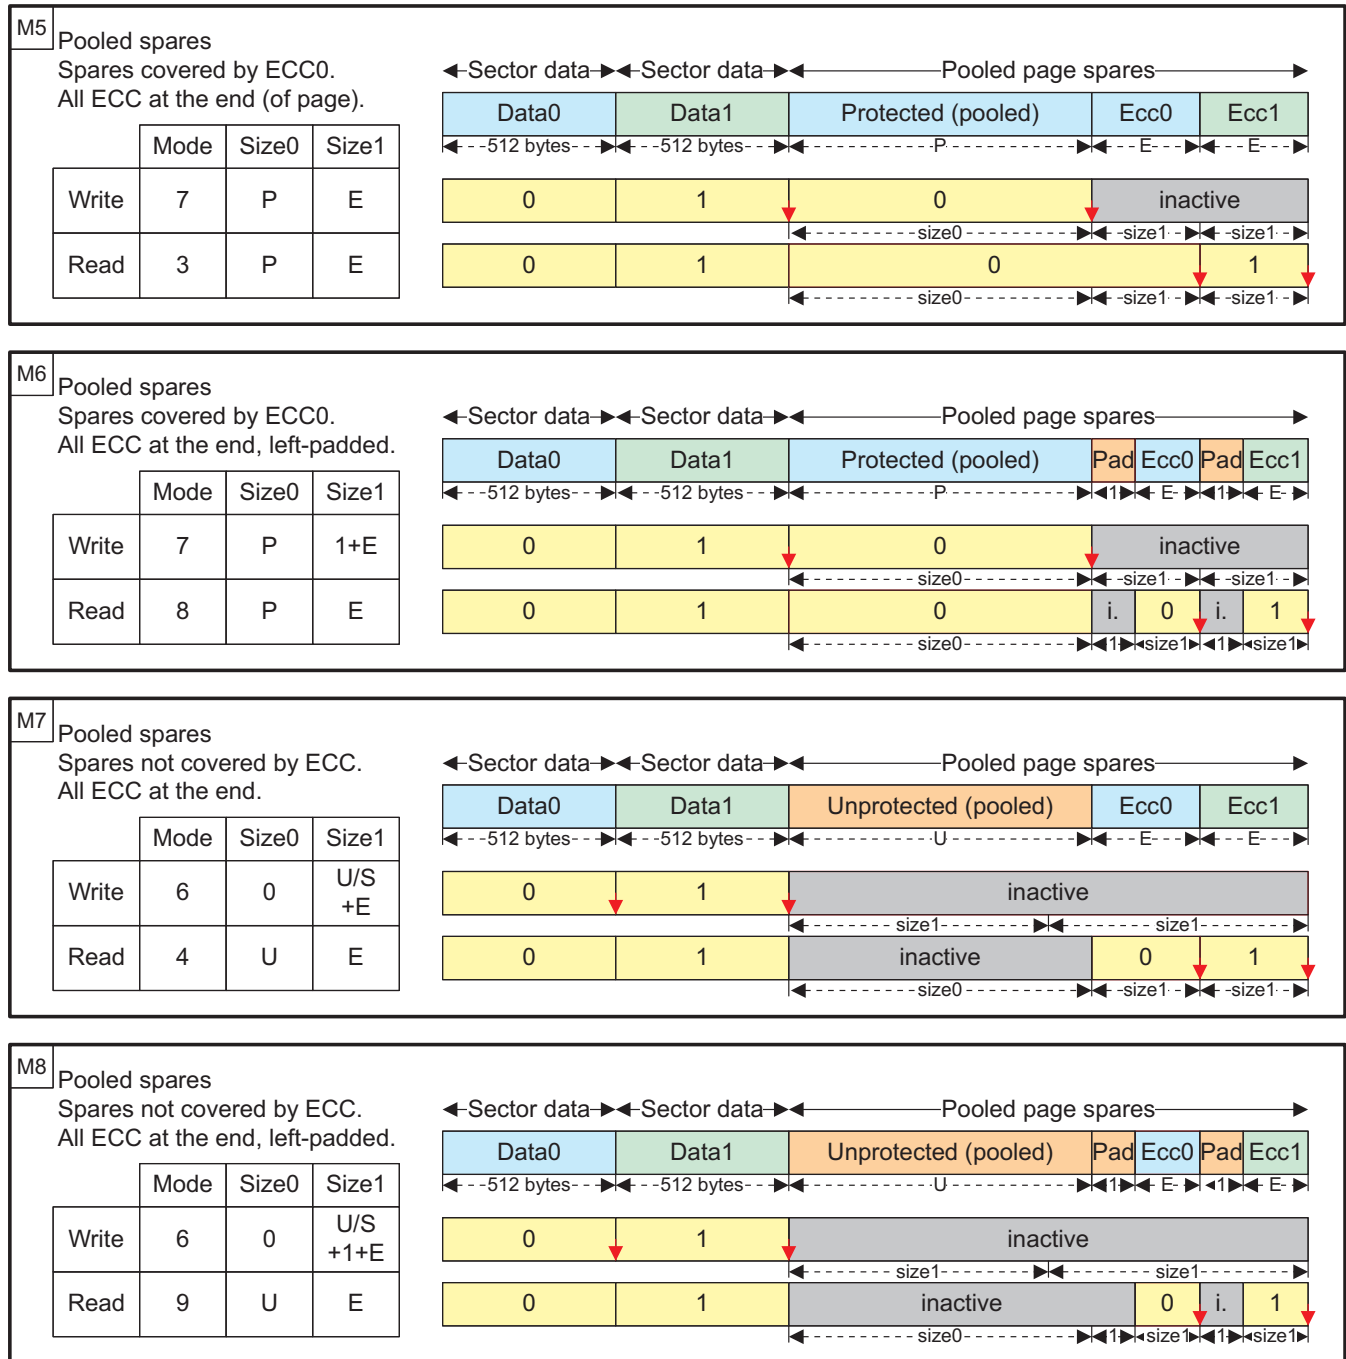

**Figure 7-38. NAND Page Mapping and ECC: Per-Sector Schemes**

7.1.3.3.12.3.3.2 Pooled Spare Mapping

In these schemes (Figure 7-39), the spare area is pooled for the page.

- The ECC of each sector is aligned at the end of the spare area.
- The non-ECC spare data may or may not be covered by the ECC of sector 0

Figure 7-39. NAND Page Mapping and ECC: Pooled Spare Schemes

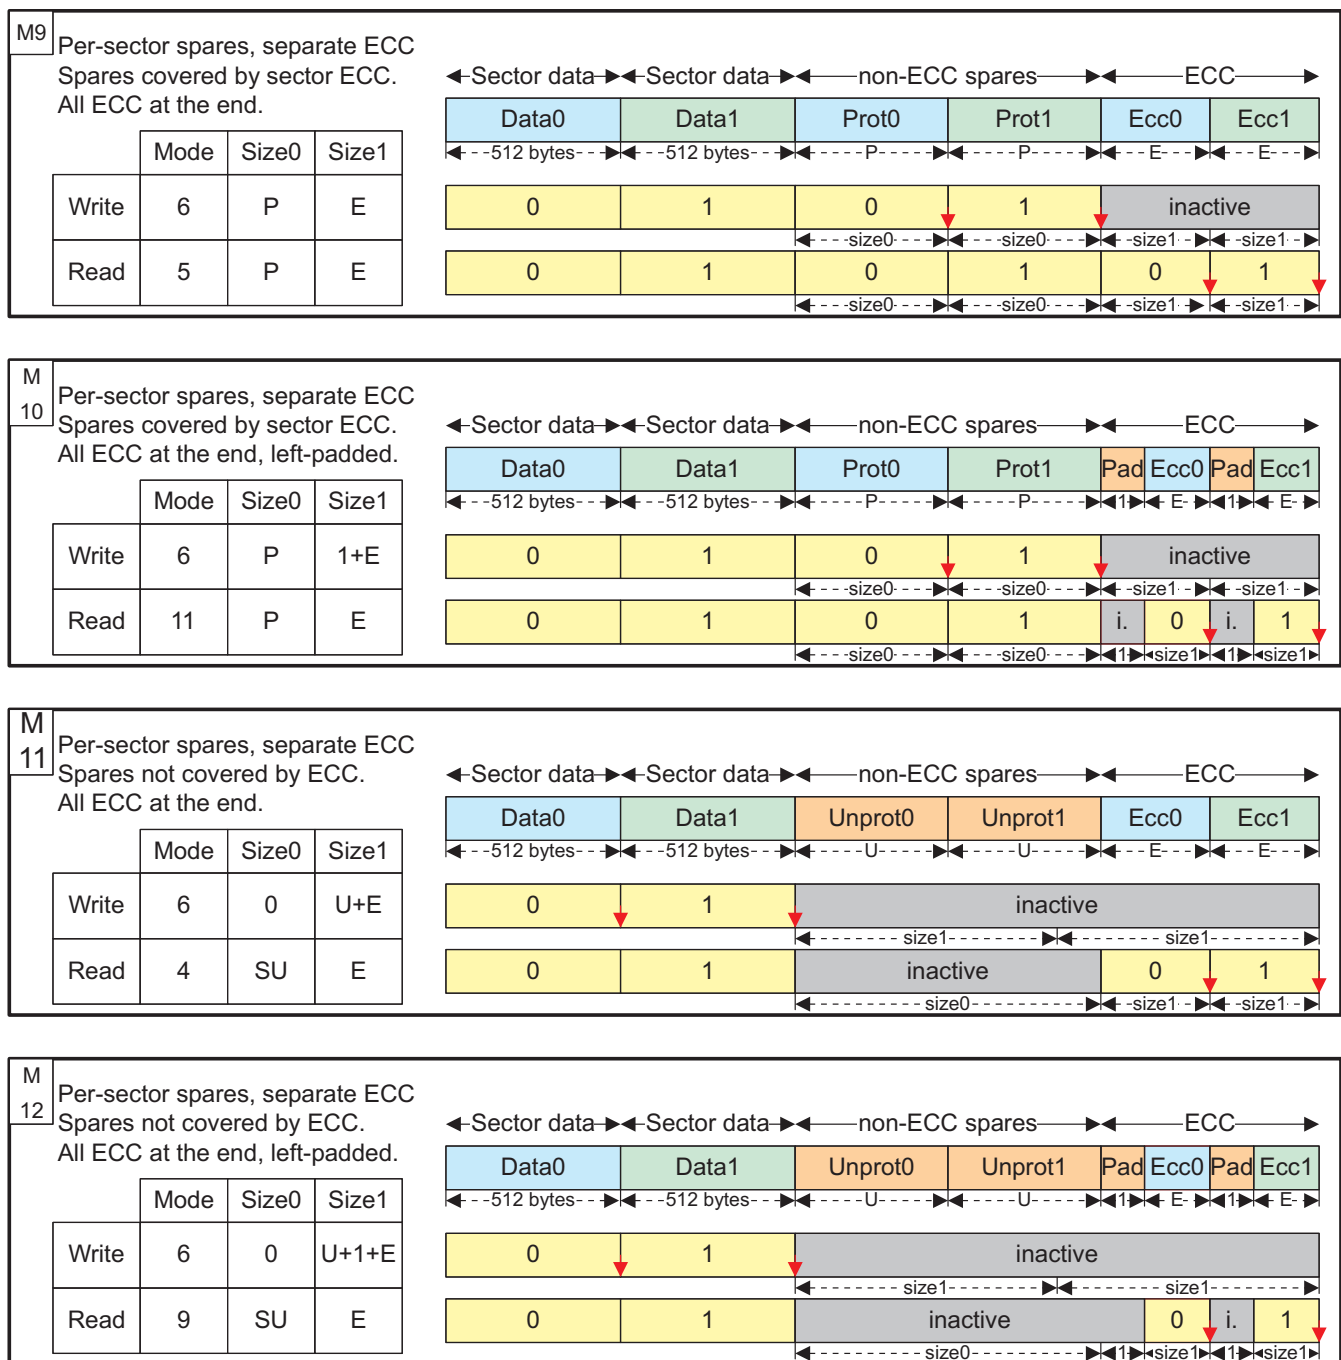

7.1.3.3.12.3.3.3 Per-Sector Spare Mapping, With ECC Separated at the End of the Page

In these schemes (Figure 7-40), each 512-byte sector of the main area is associated with two sections of the spare area.

- ECC section, all aligned at the end of the page
- other data section, aligned before the ECCs, each of which may or may not be protected by its sectors ECC

Figure 7-40. NAND Page Mapping and ECC: Per-Sector Schemes, with Separate ECC

#### 7.1.3.3.12.4 Prefetch and Write-Posting Engine

NAND device data access cycles are usually much slower than the MPU system frequency; such NAND read or write accesses issued by the processor will impact the overall system performance, especially considering long read or write sequences required for NAND page loading or programming. To minimize this effect on system performance, the GPMC includes a prefetch and write-posting engine, which can be used to read from or write to any chip-select location in a buffered manner.

The prefetch and write-posting engine is a simplified embedded-access requester that presents requests to the access engine on a user-defined chip-select target. The access engine interleaves these requests with any request coming from the L3 interface; as a default the prefetch and write-posting engine has the lowest priority.

The prefetch and write-posting engine is dedicated to data-stream access (as opposed to random data access); thus, it is primarily dedicated to NAND support. The engine does not include an address generator; the request is limited to chip-select target identification. It includes a 64-byte FIFO associated with a DMA request synchronization line, for optimal DMA-based use.

The prefetch and write-posting engine uses an embedded 64 bytes (32 16-bit word) FIFO to prefetch data from the NAND device in read mode (prefetch mode) or to store host data to be programmed into the NAND device in write mode (write-posting mode). The FIFO draining and filling (read and write) can be controlled either by the MPU through interrupt synchronization (an interrupt is triggered whenever a programmable threshold is reached) or the sDMA through DMA request synchronization, with a programmable request byte size in both prefetch or posting mode.

The prefetch and write-posting engine includes a single memory pool. Therefore, only one mode, read or write, can be used at any given time. In other words, the prefetch and write-posting engine is a single-context engine that can be allocated to only one chip-select at a time for a read prefetch or a write-posting process.

The engine does not support atomic command and address phase programming and is limited to linear memory read or write access. In consequence, it is limited to NAND data-stream access. The engine relies on the MPU NAND software driver to control block and page opening with the correct data address pointer initialization, before the engine can read from or write to the NAND memory device.

Once started, the engine data reads and writes sequencing is solely based on FIFO location availability and until the total programmed number of bytes is read or written.

Any host-concurrent accesses to a different chip-select are correctly interleaved with ongoing engine accesses. The engine has the lowest priority access so that host accesses to a different chip-select do not suffer a large latency.

A round-robin arbitration scheme can be enabled to ensure minimum bandwidth to the prefetch and write-posting engine in the case of back-to-back direct memory requests to a different chip-select. If the GPMC\_PREFETCH\_CONFIG1[23] PFPWENROUNDROBIN bit is enabled, the arbitration grants the prefetch and write posting engine access to the GPMC bus for a number of requests programmed in the GPMC\_PREFETCH\_CONFIG1[19-16] PFPWWEIGHTEDPRIO field.

The prefetch/write-posting engine read or write request is routed to the access engine with the chip-select destination ID. After the required arbitration phase, the access engine processes the request as a single access with the data access size equal to the device size specified in the corresponding chip-select configuration.

The destination chip-select configuration must be set to the NAND protocol-compatible configuration for which address lines are not used (the address bus is not changed from its current value). Selecting a different chip-select configuration can produce undefined behavior.

#### 7.1.3.3.12.4.1 General Facts About the Engine Configuration

The engine can be configured only if the GPMC\_PREFETCH\_CONTROL[0] STARTENGINE bit is de-asserted.

The engine must be correctly configured in prefetch or write-posting mode and must be linked to a NAND chip-select before it can be started. The chip-select is linked using the GPMC\_PREFETCH\_CONFIG1[26-24] ENGINECSSELECTOR field.

In both prefetch and write-posting modes, the engine respectively uses byte or 16-bit word access requests for an 8- or 16-bit wide NAND device attached to the linked chip-select. The FIFOTHRESHOLD and TRANSFERCOUNT fields must be programmed accordingly as a number of bytes or a number of 16-bit word.

When the GPMC\_PREFETCH\_CONFIG1[7] ENABLEENGINE bit is set, the FIFO entry on the L3 interconnect port side is accessible at any address in the associated chip-select memory region. When the ENABLEENGINE bit is set, any host access to this chip-select is rerouted to the FIFO input. Directly accessing the NAND device linked to this chip-select from the host is still possible through these registers:

- GPMC\_NAND\_COMMAND\_i
- GPMC\_NAND\_ADDRESS\_i
- GPMC\_NAND\_DATA\_i

The FIFO entry on the L3 interconnect port can be accessed with Byte, 16-bit word, or 32-bit word access size, according to little-endian format, even though the FIFO input is 32-bit wide.

The FIFO control is made easier through the use of interrupts or DMA requests associated with the FIFOTHRESHOLD bit field. The GPMC\_PREFETCH\_STATUS[30-24] FIFOPointer field monitors the number of available bytes to be read in prefetch mode or the number of free empty slots which can be written in write-posting mode. The GPMC\_PREFETCH\_STATUS[13-0] COUNTVALUE field monitors the number of remaining bytes to be read or written by the engine according to the TRANSFERCOUNT value. The FIFOPointer and COUNTVALUE bit fields are always expressed as a number of bytes even if a 16-bit wide NAND device is attached to the linked chip-select.

In prefetch mode, when the FIFOPointer equals 0, that is, the FIFO is empty, a host read access receives the byte last read from the FIFO as its response. In case of 32-bit word or 16-bit word read accesses, the last byte read from the FIFO is copied the required number of times to fit the requested word size. In write-posting mode, when the FIFOPointer equals 0, that is, the FIFO is full, a host write overwrites the last FIFO byte location. There is no underflow or overflow error reporting in the GPMC.

### 7.1.3.3.12.4.2 Prefetch Mode

The prefetch mode is selected when the GPMC\_PREFETCH\_CONFIG1[0] ACCESSMODE bit is cleared.

The MPU NAND software driver must issue the block and page opening (READ) command with the correct data address pointer initialization before the engine can be started to read from the NAND memory device. The engine is started by asserting the GPMC\_PREFETCH\_CONTROL[0] STARTENGINE bit. The STARTENGINE bit automatically clears when the prefetch process completes.

If required, the ECC calculator engine must be initialized (i.e., reset, configured, and enabled) before the prefetch engine is started, so that the ECC is correctly computed on all data read by the prefetch engine.

When the GPMC\_PREFETCH\_CONFIG1[3] SYNCHROMODE bit is cleared, the prefetch engine starts requesting data as soon as the STARTENGINE bit is set. If using this configuration, the host must monitor the NAND device-ready pin so that it only sets the STARTENGINE bit when the NAND device is in a ready state, meaning data is valid for prefetching.

When the SYNCHROMODE bit is set, the prefetch engine starts requesting data when an active to inactive wait signal transition is detected. The transition detector must be cleared before any transition detection; see [Section 7.1.3.3.12.2.2](#). The GPMC\_PREFETCH\_CONFIG1[5-4] WAITPINSELECTOR field selects which gpmc\_wait pin edge detector triggers the prefetch engine in this synchronized mode.

If the STARTENGINE bit is set after the NAND address phase (page opening command), the engine is effectively started only after the actual NAND address phase completion. To prevent GPMC stall during this NAND address phase, set the STARTENGINE bit field before NAND address phase completion when in synchronized mode. The prefetch engine will start when an active to inactive wait signal transition is detected. The STARTENGINE bit is automatically cleared on prefetch process completion.

The prefetch engine issues a read request to fill the FIFO with the amount of data specified by GPMC\_PREFETCH\_CONFIG2[13-0] TRANSFERCOUNT field.

[Table 7-22](#) describes the prefetch mode configuration.

**Table 7-22. Prefetch Mode Configuration**

Bit Field	Register	Value	Comments
STARTENGINE	GPMC_PREFETCH_CONTROL	0	Prefetch engine can be configured only if STARTENGINE is cleared to 0.
ENGINECSSELECTOR	GPMC_PREFETCH_CONFIG1	0 to 3h	Selects the chip-select associated with a NAND device where the prefetch engine is active.
ACCESSMODE	GPMC_PREFETCH_CONFIG1	0	Selects prefetch mode
FIFOTHRESHOLD	GPMC_PREFETCH_CONFIG1		Selects the maximum number of bytes read or written by the host on DMA or interrupt request
TRANSFERCOUNT	GPMC_PREFETCH_CONFIG1		Selects the number of bytes to be read or written by the engine to the selected chip-select
SYNCHROMODE	GPMC_PREFETCH_CONFIG1	0/1	Selects when the engine starts the access to the chip-select
WAITPINSELECT	GPMC_PREFETCH_CONFIG1	0 to 1	Selects wait pin edge detector (if GPMC_PREFETCH_CONFIG1[3] SYNCHROMODE = 1)
ENABLEOPTIMIZEDACCESS	GPMC_PREFETCH_CONFIG1	0/1	See <a href="#">Section 7.1.3.3.12.4.6</a>
CYCLEOPTIMIZATION	GPMC_PREFETCH_CONFIG1		Number of clock cycle removed to timing parameters
ENABLEENGINE	GPMC_PREFETCH_CONFIG1	1	Engine enabled
STARTENGINE	GPMC_PREFETCH_CONFIG1	1	Starts the prefetch engine

#### 7.1.3.3.12.4.3 FIFO Control in Prefetch Mode

The FIFO can be drained directly by the MPU or by an eDMA channel.

In MPU draining mode, the FIFO status can be monitored through the GPMC\_PREFETCH\_STATUS[30-24] FIFOPINTER field or through the GPMC\_PREFETCH\_STATUS[16] FIFOTHRESHOLDSTATUS bit. The FIFOPINTER indicates the current number of available data to be read; FIFOTHRESHOLDSTATUS set to 1 indicates that at least FIFOTHRESHOLD bytes are available from the FIFO.

An interrupt can be triggered by the GPMC if the GPMC\_IRQENABLE[0] FIFOEVENTENABLE bit is set. The FIFO interrupt event is logged, and the GPMC\_IRQSTATUS[0] FIFOEVENTSTATUS bit is set. To clear the interrupt, the MPU must read all the available bytes, or at least enough bytes to get below the programmed FIFO threshold, and the FIFOEVENTSTATUS bit must be cleared to enable further interrupt events. The FIFOEVENTSTATUS bit must always be reset prior to asserting the FIFOEVENTENABLE bit to clear any out-of-date logged interrupt event. This interrupt generation must be enabled after enabling the STARTENGINE bit.

Prefetch completion can be monitored through the GPMC\_PREFETCH\_STATUS[13-0] COUNTVALUE field. COUNTVALUE indicates the number of currently remaining data to be requested according to the TRANSFERCOUNT value. An interrupt can be triggered by the GPMC when the prefetch process is complete (that is, COUNTVALUE equals 0) if the GPMC\_IRQENABLE[1] TERMINALCOUNTEVENTENABLE bit is set. At prefetch completion, the TERMINALCOUNT interrupt event is also logged, and the GPMC\_IRQSTATUS[1] TERMINALCOUNTSTATUS bit is set. To clear the interrupt, the MPU must clear the TERMINALCOUNTSTATUS bit. The TERMINALCOUNTSTATUS bit must always be cleared prior to asserting the TERMINALCOUNTEVENTENABLE bit to clear any out-of-date logged interrupt event.

---

**NOTE:** The COUNTVALUE value is only valid when the prefetch engine is active (started), and an interrupt is only triggered when COUNTVALUE reaches 0, that is, when the prefetch engine automatically goes from an active to an inactive state.

---

The number of bytes to be prefetched (programmed in TRANSFERCOUNT) must be a multiple of the programmed FIFOTHRESHOLD to trigger the correct number of interrupts allowing a deterministic and transparent FIFO control. If this guideline is respected, the number of ISR accesses is always required and the FIFO is always empty after the last interrupt is triggered. In other cases, the TERMINALCOUNT interrupt must be used to read the remaining bytes in the FIFO (the number of remaining bytes being lower than the FIFOTHRESHOLD value).

In DMA draining mode, the GPMC\_PREFETCH\_CONFIG1[2] DMAMODE bit must be set so that the GPMC issues a DMA hardware request when at least FIFOTHRESHOLD bytes are ready to be read from the FIFO. The DMA channel owning this DMA request must be programmed so that the number of bytes programmed in FIFOTHRESHOLD is read from the FIFO during the DMA request process. The DMA request is kept active until this number of bytes has effectively been read from the FIFO, and no other DMA request can be issued until the ongoing active request is complete.

In prefetch mode, the TERMINALCOUNT event is also a source of DMA requests if the number of bytes to be prefetched is not a multiple of FIFOTHRESHOLD, the remaining bytes in the FIFO can be read by the DMA channel using the last DMA request. This assumes that the number of remaining bytes to be read is known and controlled through the DMA channel programming model.

Any potentially active DMA request is cleared when the prefetch engine goes from inactive to active prefetch (the STARTENGINE bit is set to 1). The associated DMA channel must always be enabled by the MPU after setting the STARTENGINE bit so that the out-of-date active DMA request does not trigger spurious DMA transfers.

#### 7.1.3.3.12.4.4 Write-Posting Mode

The write-posting mode is selected when the GPMC\_PREFETCH\_CONFIG1[0] ACCESSMODE bit is set.

The MPU NAND software driver must issue the correct address pointer initialization command (page program) before the engine can start writing data into the NAND memory device. The engine starts when the GPMC\_PREFETCH\_CONTROL[0] STARTENGINE bit is set to 1. The STARTENGINE bit clears automatically when posting completes. When all data have been written to the NAND memory device, the MPU NAND software driver must issue the second cycle program command and monitor the status for programming process completion (adding ECC handling, if required).

If used, the ECC calculator engine must be started (configured, reset, and enabled) before the posting engine is started so that the ECC parities are properly calculated on all data written by the prefetch engine to the associated chip-select.

In write-posting mode, the GPMC\_PREFETCH\_CONFIG1[3] SYNCHROMODE bit must be cleared so that posting starts as soon as the STARTENGINE bit is set and the FIFO is not empty.

If the STARTENGINE bit is set after the NAND address phase (page program command), the STARTENGINE setting is effective only after the actual NAND command completion. To prevent GPMC stall during this NAND command phase, set the STARTENGINE bit field before the NAND address completion and ensure that the associated DMA channel is enabled after the NAND address phase.

The posting engine issues a write request when valid data are available from the FIFO and until the programmed GPMC\_PREFETCH\_CONFIG2[13-0] TRANSFERCOUNT accesses have been completed.

The STARTENGINE bit clears automatically when posting completes. When all data have been written to the NAND memory device, the MPU NAND software driver must issue the second cycle program command and monitor the status for programming process completion. The closing program command phase must only be issued when the full NAND page has been written into the NAND flash write buffer, including the spare area data and the ECC parities, if used.

**Table 7-23. Write-Posting Mode Configuration**

Bit Field	Register	Value	Comments
STARTENGINE	GPMC_PREFETCH_CONTROL	0	Write-posting engine can be configured only if STARTENGINE is cleared to 0.
ENGINECSSELECTOR	GPMC_PREFETCH_CONFIG1	0 to 3h	Selects the chip-select associated with a NAND device where the prefetch engine is active
ACCESSMODE	GPMC_PREFETCH_CONFIG1	1	Selects write-posting mode
FIFOTHRESHOLD	GPMC_PREFETCH_CONFIG1		Selects the maximum number of bytes read or written by the host on DMA or interrupt request
TRANSFERCOUNT	GPMC_PREFETCH_CONFIG2		Selects the number of bytes to be read or written by the engine from/to the selected chip-select
SYNCHROMODE	GPMC_PREFETCH_CONFIG1	0	Engine starts the access to chip-select as soon as STARTENGINE is set.
ENABLEOPTIMIZEDACCESS	GPMC_PREFETCH_CONFIG1	0/1	See <a href="#">Section 7.1.3.3.12.4.6</a>
CYCLEOPTIMIZATION	GPMC_PREFETCH_CONFIG		
ENABLEENGINE	GPMC_PREFETCH_CONFIG1	1	Engine enabled
STARTENGINE	GPMC_PREFETCH_CONTROL	1	Starts the prefetch engine

#### 7.1.3.3.12.4.5 FIFO Control in Write-Posting Mode

The FIFO can be filled directly by the MPU or by an sDMA channel.

In MPU filling mode, the FIFO status can be monitored through the FIFOPINTER or through the GPMC\_PREFETCH\_STATUS[16] FIFOTHRESHOLDSTATUS bit. FIFOPINTER indicates the current number of available free byte places in the FIFO, and the FIFOTHRESHOLDSTATUS bit, when set, indicates that at least FIFOTHRESHOLD free byte places are available in the FIFO.

An interrupt can be issued by the GPMC if the GPMC\_IRQENABLE[0] FIFOEVENTENABLE bit is set. When the interrupt is fired, the GPMC\_IRQSTATUS[0] FIFOEVENTSTATUS bit is set. To clear the interrupt, the MPU must write enough bytes to fill the FIFO, or enough bytes to get below the programmed threshold, and the FIFOEVENTSTATUS bit must be cleared to get further interrupt events. The FIFOEVENTSTATUS bit must always be cleared prior to asserting the FIFOEVENTENABLE bit to clear any out-of-date logged interrupt event. This interrupt must be enabled after enabling the STARTENGINE bit.

The posting completion can be monitored through the GPMC\_PREFETCH\_STATUS[13-0] COUNTVALUE field. COUNTVALUE indicates the current number of remaining data to be written based on the TRANSFERCOUNT value. An interrupt is issued by the GPMC when the write-posting process completes (that is, COUNTVALUE equal to 0) if the GPMC\_IRQENABLE[1] TERMINALCOUNTENABLE bit is set. When the interrupt is fired, the GPMC\_IRQSTATUS[1] TERMINALCOUNTSTATUS bit is set. To clear the interrupt, the MPU must clear the TERMINALCOUNTSTATUS bit. The TERMINALCOUNTSTATUS bit must always be cleared prior to asserting the TERMINALCOUNTENABLE bit to clear any out-of-date logged interrupt event.

---

**NOTE:** The COUNTVALUE value is only valid if the write-posting engine is active and started, and an interrupt is only issued when COUNTVALUE reaches 0, that is, when the posting engine automatically goes from active to inactive.

---

In DMA filling mode, the DMAMode bit field in the GPMC\_PREFETCH\_CONFIG1[2] DMAMODE bit must be set so that the GPMC issues a DMA hardware request when at least FIFOTHRESHOLD bytes-free places are available in the FIFO. The DMA channel owning this DMA request must be programmed so that a number of bytes equal to the value programmed in the FIFOTHRESHOLD bit field are written into the FIFO during the DMA access. The DMA request remains active until the associated number of bytes has effectively been written into the FIFO, and no other DMA request can be issued until the ongoing active request has been completed.

Any potentially active DMA request is cleared when the prefetch engine goes from inactive to active prefetch (STARTENGINE set to 1). The associated DMA channel must always be enabled by the MPU after setting the STARTENGINE bit so that an out-of-date active DMA request does not trigger spurious DMA transfers.

In write-posting mode, the DMA or the MPU fill the FIFO with no consideration to the associated byte enables. Any byte stored in the FIFO is written into the memory device.

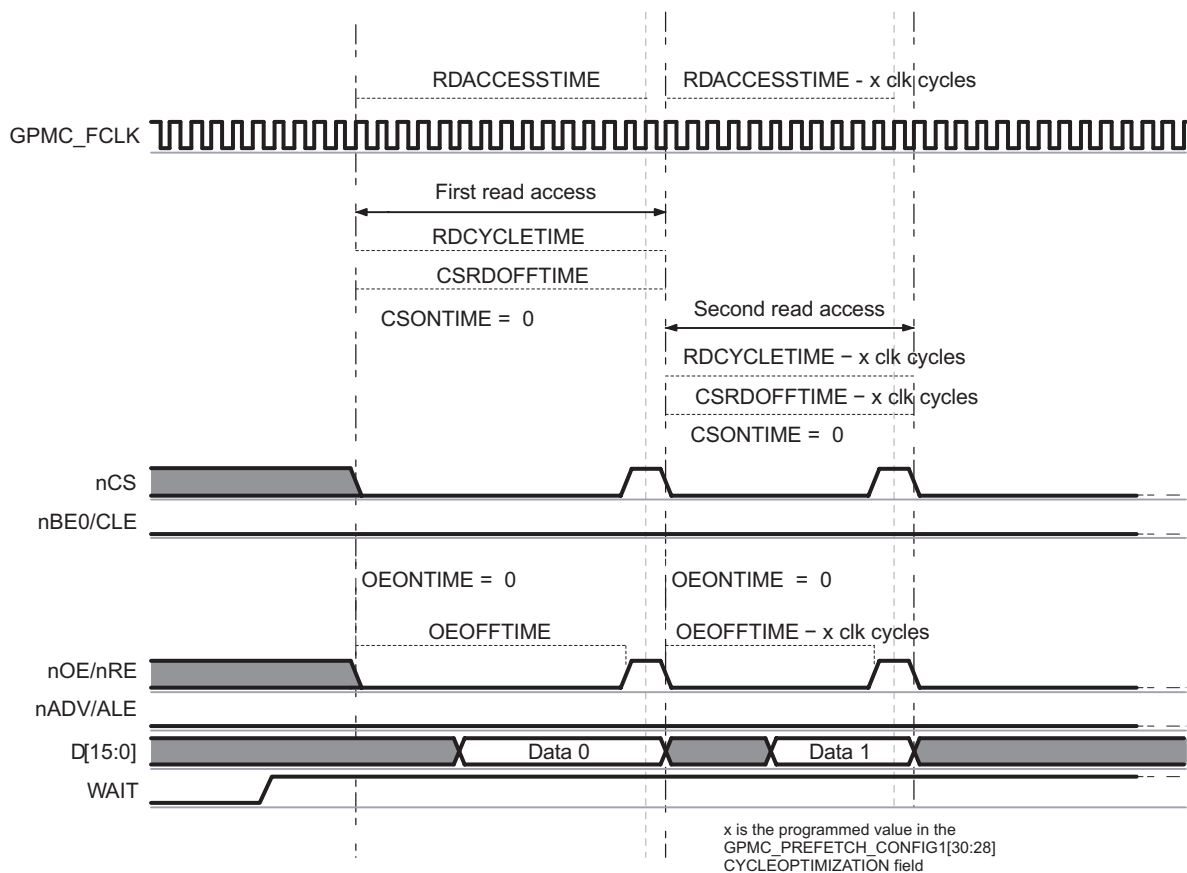

**7.1.3.3.12.4.6 Optimizing NAND Access Using the Prefetch and Write-Posting Engine**

Access time to a NAND memory device can be optimized for back-to-back accesses if the associated CSn signal is not deasserted between accesses. The GPMC access engine can track prefetch engine accesses to optimize the access timing parameter programmed for the allocated chip-select, if no accesses to other chip-selects (that is, interleaved accesses) occur. Similarly, the access engine also eliminates the CYCLE2CYCLEDELAY even if CYCLE2CYCLESAMEECSEN is set. This capability is limited to the prefetch and write-posting engine accesses, and MPU accesses to a NAND memory device (through the defined chip-select memory region or through the GPMC\_NAND\_DATA\_i are never optimized.

The GPMC\_PREFETCH\_CONFIG1[27] ENABLEOPTIMIZEDACCESS bit must be set to enable optimized accesses. To optimize access time, the GPMC\_PREFETCH\_CONFIG1[30-28] CYCLEOPTIMIZATION field defines the number of GPMC\_FCLK cycles to be suppressed from the RDCYCLETIME, WRCYCLETIME, RDACCESSTIME, WRACCESSTIME, CSOFFTIME, ADVOFFTIME, OEOFFTIME, and WEOFFTIME timing parameters.

Figure 7-41, in the case of back-to-back accesses to the NAND flash through the prefetch engine, CYCLE2CYCLESAMEECSEN is forced to 0 when using optimized accesses. The first access uses the regular timing settings for this chip-select. All accesses after this one use settings reduced by x clock cycles, x being defined by the GPMC\_PREFETCH\_CONFIG1[30-28] CYCLEOPTIMIZATION field.

**Figure 7-41. NAND Read Cycle Optimization Timing Description**

#### **7.1.3.3.12.4.7 Interleaved Accesses Between Prefetch and Write-Posting Engine and Other Chip-Selects**

Any on-going read or write access from the prefetch and write-posting engine is completed before an access to any other chip-select can be initiated. As a default, the arbiter uses a fixed-priority algorithm, and the prefetch and write-posting engine has the lowest priority. The maximum latency added to access starting time in this case equals the RDCYCLETIME or WRCYCLETIME (optimized or not) plus the requested BUSTURNAROUND delay for bus turnaround completion programmed for the chip-select to which the NAND device is connected to.

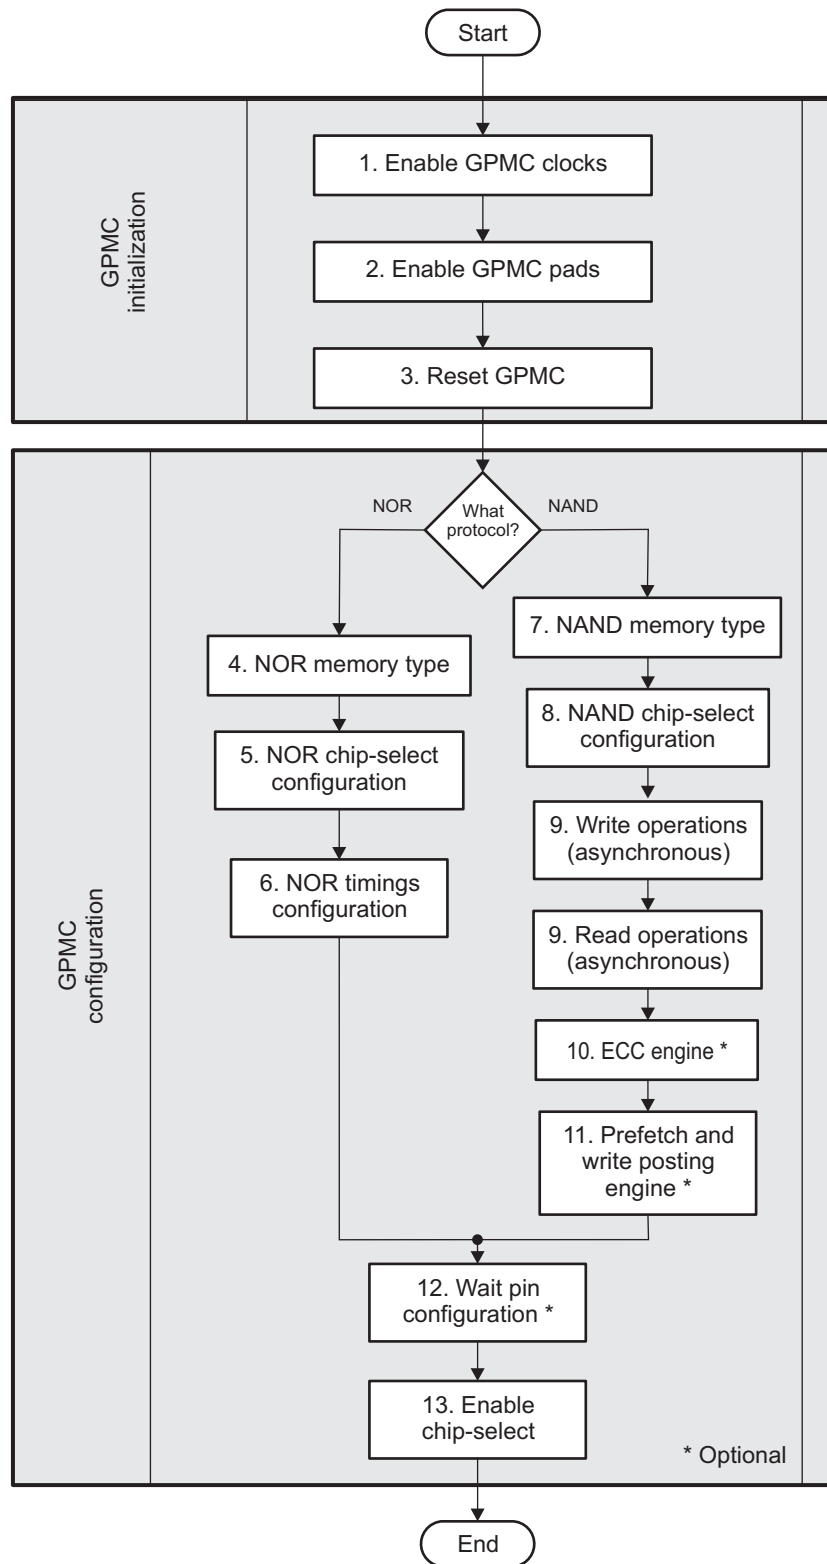

Alternatively, a round-robin arbitration can be used to prioritize accesses to the external bus. This arbitration scheme is enabled by setting the GPMC\_PREFETCH\_CONFIG1[23] PFPWENROUNDROBIN bit. When a request to another chip-select is received while the prefetch and write-posting engine is active, priority is given to the new request. The request processed thereafter is the prefetch and write-posting engine request, even if another interconnect request is passed in the mean time. The engine keeps control of the bus for an additional number of requests programmed in the GPMC\_PREFETCH\_CONFIG1[19-16] PFPWWEIGHTEDPRIO bit field. Control is then passed to the direct interconnect request.

As an example, the round-robin arbitration scheme is selected with PFPWWEIGHTEDPRIO set to 2h. Considering the prefetch and write-posting engine and the interconnect interface are always requesting access to the external interface, the GPMC grants priority to the direct interconnect access for one request. The GPMC then grants priority to the engine for three requests, and finally back to the direct interconnect access, until the arbiter is reset when one of the two initiators stops initiating requests.

#### 7.1.3.4 GPMC High-Level Programming Model Overview

The high-level programming model introduces a top-down approach for users that need to configure the GPMC module. [Figure 7-42](#) shows a programming model top-level diagram for the GPMC. Each block of the diagram is described in one of the following subsections through a set of registers to configure. [Table 7-24](#) and [Table 7-25](#) list each step in the model.

Figure 7-42. Programming Model Top-Level Diagram

**Table 7-24. GPMC Configuration in NOR Mode**

Step	Description
NOR Memory Type	See <a href="#">Table 7-27</a>
NOR Chip-Select Configuration	See <a href="#">Table 7-28</a>
NOR Timings Configuration	See <a href="#">Table 7-29</a>
Wait Pin Configuration	See <a href="#">Table 7-30</a>
Enable Chip-Select	See <a href="#">Table 7-31</a>

**Table 7-25. GPMC Configuration in NAND Mode**

Step	Description
NAND Memory Type	See <a href="#">Table 7-32</a>
NAND Chip-Select Configuration	See <a href="#">Table 7-33</a>
Write Operations (Asynchronous)	See <a href="#">Table 7-34</a>
Read Operations (Asynchronous)	See <a href="#">Table 7-34</a>
ECC Engine	See <a href="#">Table 7-35</a>
Prefetch and Write-Posting Engine	See <a href="#">Table 7-36</a>
Wait Pin Configuration	See <a href="#">Table 7-37</a>
Enable Chip-Select	See <a href="#">Table 7-38</a>

### 7.1.3.5 GPMC Initialization

[Table 7-26](#) describes the settings required to reset the GPMC.

**Table 7-26. Reset GPMC**

Sub-process Name	Register / Bitfield	Value
Start a software reset	GPMC_SYSCONFIG[1] SOFTRESET	1
Wait until	GPMC_SYSSTATUS[0] RESETDONE	1

### 7.1.3.6 GPMC Configuration in NOR Mode

This section gives a generic configuration for parameters related to the NOR memory connected to the GPMC. [Table 7-27](#) through [Table 7-31](#) list the steps to configure the GPMC in NOR mode.

**NOTE:** In the tables of this section, 'x' in Value column stands for 'depends on configuration'.

**Table 7-27. NOR Memory Type**

Sub-process Name	Register / Bitfield	Value
Set the NOR protocol	GPMC_CONFIG1_i[11-10] DEVICETYPE	0
Set a device size	GPMC_CONFIG1_i[13-12] DEVICESIZE	x
Select an address and data multiplexing protocol	GPMC_CONFIG1_i[9] MUXADDDATA	x
Set the attached device page length	GPMC_CONFIG1_i[24-23] ATTACHEDDEVICEPAGELENGTH	x
Set the wrapping burst capabilities	GPMC_CONFIG1_i[31] WRAPBURST	x
Select a timing signals latencies factor	GPMC_CONFIG1_i[4] TIMEPARAGRANULARITY	x
Select an output clock frequency	GPMC_CONFIG1_i[1-0] GPMCFCLKDIVIDER	x
Choose an output clock activation time	GPMC_CONFIG1_i[26-25] CLKACTIVATIONTIME	x
Set a single or multiple access for read operations	GPMC_CONFIG1_i[30] READMULTIPLE	x
Set a synchronous or asynchronous mode for read operations	GPMC_CONFIG1_i[29] READTYPE	x
Set a single or multiple access for write operations	GPMC_CONFIG1_i[28] WRITEMULTIPLE	x
Set a synchronous or asynchronous mode for write operations	GPMC_CONFIG1_i[27] WRITETYPE	x

**Table 7-28. NOR Chip-Select Configuration**

Sub-process Name	Register / Bitfield	Value
Select the chip-select base address	GPMC_CONFIG7_i[5-0] BASEADDRESS	x
Select the chip-select mask address	GPMC_CONFIG7_i[11-8] MASKADDRESS	x

**Table 7-29. NOR Timings Configuration**

Sub-process Name	Register / Bitfield	Value
Configure adequate timing parameters in various memory modes	See <a href="#">Section 7.1.3.9</a>	

**Table 7-30. WAIT Pin Configuration**

Sub-process Name	Register / Bitfield	Value
Enable or disable wait pin monitoring for read operations	GPMC_CONFIG1_i[22] WAITREADMONITORING	x
Enable or disable wait pin monitoring for write operations	GPMC_CONFIG1_i[21] WAITWRITEMONITORING	x
Select a wait pin monitoring time	GPMC_CONFIG1_i[19-18] WAITMONITORINGTIME	x
Choose the input wait pin for the chip-select	GPMC_CONFIG1_i[17-16] WAITPINSELECT	x

**Table 7-31. Enable Chip-Select**

Sub-process Name	Register / Bitfield	Value
When all parameters are configured, enable the chip-select	GPMC_CONFIG7_i[6] CSVALID	x

### 7.1.3.7 GPMC Configuration in NAND Mode

This section gives a generic configuration for parameters related to NAND memory connected to the GPMC.

**Table 7-32. NAND Memory Type**

Sub-process Name	Register / Bitfield	Value
Set the NAND protocol	GPMC_CONFIG1_i[11-10] DEVICETYPE	2h
Set a device size	GPMC_CONFIG1_i[13-12] DEVICESIZE	x
Set the address and data multiplexing protocol to non-multiplexed attached device	GPMC_CONFIG1_i[9] MUXADDDATA	0
Select a timing signals latencies factor	GPMC_CONFIG1_i[4] TIMEPARAGRANULARITY	x
Set a synchronous or asynchronous mode and a single or multiple access for read and write operations	See <a href="#">Section 7.1.3.8</a>	x

**Table 7-33. NAND Chip-Select Configuration**

Sub-process Name	Register / Bitfield	Value
Select the chip-select base address	GPMC_CONFIG7_i[5-0] BASEADDRESS	x
Select the chip-select minimum granularity (16M bytes)	GPMC_CONFIG7_i[11-8] MASKADDRESS	x

**Table 7-34. Asynchronous Read and Write Operations**

Sub-process Name	Register / Bitfield	Value
Configure adequate timing parameters in asynchronous modes	See <a href="#">Section 7.1.3.9</a>	

**Table 7-35. ECC Engine**

Sub-process Name	Register / Bitfield	Value
Select the ECC result register where the first ECC computation is stored (Only applies to Hamming)	GPMC_ECC_CONTROL[3-0] ECCPOINTER	x
Clear all ECC result registers	GPMC_ECC_CONTROL[8] ECCCLEAR	Write 1 to clear
Define ECCSIZE0 and ECCSIZE1	GPMC_ECC_SIZE_CONFIG[19-12] ECCSIZE0 and GPMC_ECC_SIZE_CONFIG[29-22] ECCSIZE1	x
Select the size of each of the 9 result registers (size specified by ECCSIZE0 or ECCSIZE1)	GPMC_ECC_SIZE_CONFIG[j-1] ECCjRESULTSIZ where j = 1 to 9	x
Select the chip-select where ECC is computed	GPMC_ECC_SIZE_CONFIG[3-1] ECCCS	x
Select the Hamming code or BCH code ECC algorithm in use	GPMC_ECC_SIZE_CONFIG[16] ECCALGORITHM	x
Select word size for ECC calculation	GPMC_ECC_SIZE_CONFIG[7] ECC16B	x
If the BCH code is used, Set an error correction capability and Select a number of sectors to process	GPMC_ECC_SIZE_CONFIG[13-12] ECCBCHTSEL and GPMC_ECC_SIZE_CONFIG[6-4] ECCTOPSECTOR	x

**Table 7-35. ECC Engine (continued)**

Sub-process Name	Register / Bitfield	Value
Enable the ECC computation	GPMC_ECC_SIZE_CONFIG[0] ECCENABLE	1

**Table 7-36. Prefetch and Write-Posting Engine**

Sub-process Name	Register / Bitfield	Value
Disable the engine before configuration	GPMC_PREFETCH_CONTROL[0] STARTENGINE	0
Select the chip-select associated with a NAND device where the prefetch engine is active	GPMC_PREFETCH_CONFIG1[26-24] ENGINECSSELECTOR	x
Select access direction through prefetch engine, read or write.	GPMC_PREFETCH_CONFIG1[0] ACCESSMODE	x
Select the threshold used to issue a DMA request	GPMC_PREFETCH_CONFIG1[14-8] FIFOTHRESHOLD	x
Select either DMA synchronized mode or SW manual mode.	GPMC_PREFETCH_CONFIG1[2] DMAMODE	x
Select if the engine immediately starts accessing the memory upon STARTENGINE assertion or if hardware synchronization based on a WAIT signal is used.	GPMC_PREFETCH_CONFIG1[3] SYNCHROMODE	x
Select which wait pin edge detector should start the engine in synchronized mode	GPMC_PREFETCH_CONFIG1[5-4] WAITPINSELECTOR	x
Enter a number of clock cycles removed to timing parameters (For all back-to-back accesses to the NAND flash but not the first one)	GPMC_PREFETCH_CONFIG1[30-28] CYCLOPTIMIZATION	x
Enable the prefetch postwrite engine	GPMC_PREFETCH_CONFIG1[7] ENABLEENGINE	1
Select the number of bytes to be read or written by the engine to the selected chip-select	GPMC_PREFETCH_CONFIG2[13-0] TRANSFERCOUNT	x
Start the prefetch engine	GPMC_PREFETCH_CONTROL[0] STARTENGINE	1

**Table 7-37. WAIT Pin Configuration**

Sub-process Name	Register / Bitfield	Value
Selects when the engine starts the access to CS	GPMC_PREFETCH_CONFIG1[3] SYNCHROMODE	x
Select which wait pin edge detector should start the engine in synchronized mode	GPMC_PREFETCH_CONFIG1[5-4] WAITPINSELECTOR	x

**Table 7-38. Enable Chip-Select**

Sub-process Name	Register / Bitfield	Value
When all parameters are configured, enable the chip-select	GPMC_CONFIG7_j[6] CSVALID	x

### 7.1.3.8 Set Memory Access

This section details the bit field to configure to set the GPMC in various memory modes.

**Table 7-39. Mode Parameters Check List Table**

Register	Bit	Bit Field Name	Asynchronous				Synchronous			
			Single Read Access	Single Write Access	Multiple Read (Page) Access	Multiple Write (Page) Access	Single Read Access	Single Write Access	Multiple Read (Burst) Access	Multiple Write (Burst) Access
GPMC_CONFIG1_i	30	READMULTIPLE	0	-	1	N/S	0	-	1	-
GPMC_CONFIG1_i	29	READTYPE	0	-	0	N/S	1	-	1	-
GPMC_CONFIG1_i	28	WRITEMULTIPLE	-	0		N/S	-	0	-	1
GPMC_CONFIG1_i	27	WRITETYPE	-	0		N/S	-	1	-	1

**Table 7-40. Access Type Parameters Check List Table**

Register	Bit	Bit Field Name	Access Type		
			Non-Mux	Address/Data Mux	AAD Mux
GPMC_CONFIG1_i	9-8	MUXADDDATA	0	2h	1

7.1.3.9 GPMC Timing Parameters

Figure 7-43 shows a programming model diagram for the NOR interfacing timing parameters.

Table 7-41 lists bit fields to configure adequate timing parameter in various memory modes.

Figure 7-43. NOR Interfacing Timing Parameters Diagram

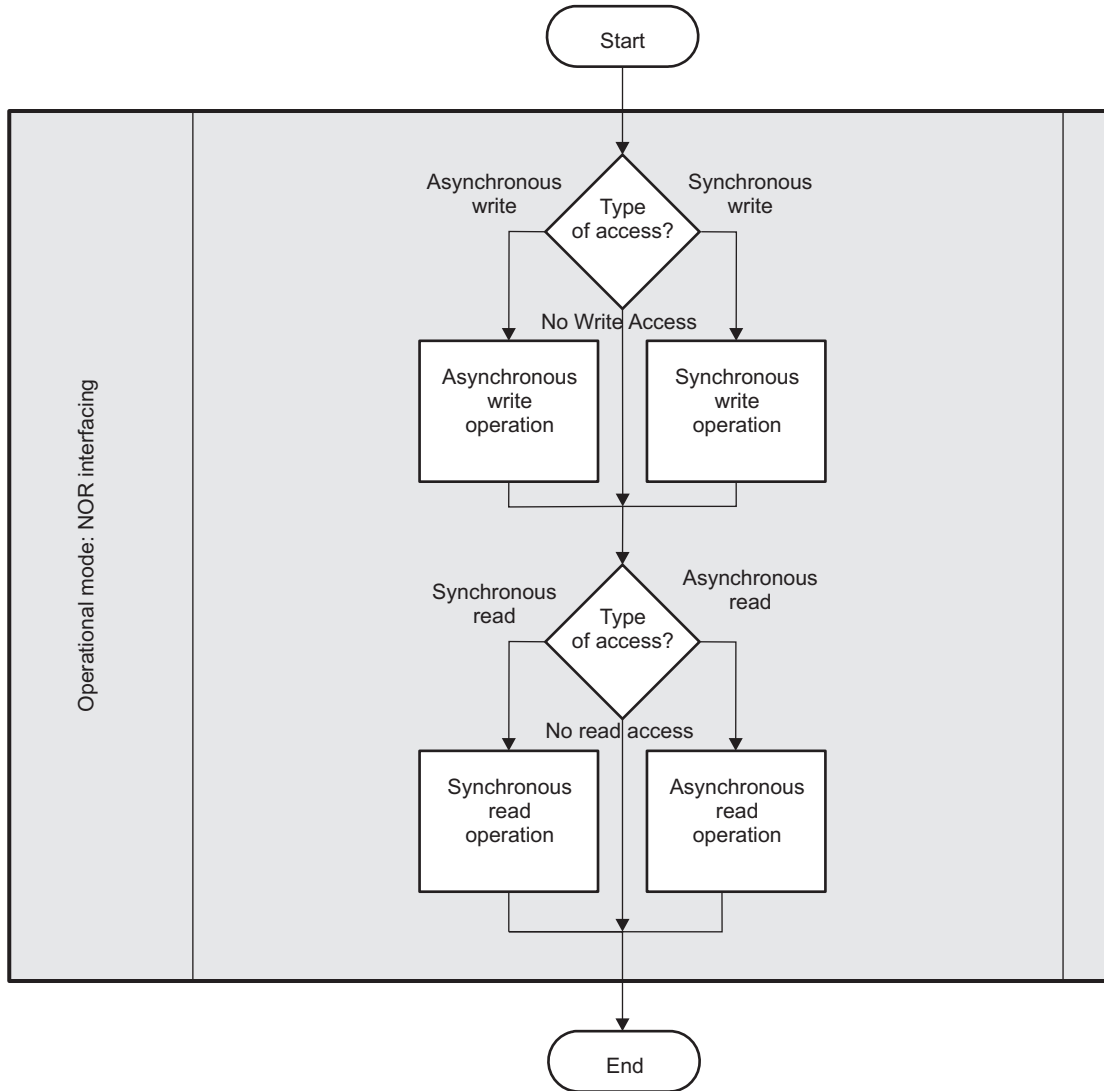

Table 7-41. Timing Parameters

Register	Bit	Bit Field Name	Asynchronous			Synchronous				Access Type		
			Single Read Access	Single Write Access	Multiple Read (Page) access	Single Read Access	Single Write Access	Multiple Read (Burst) Access	Multiple Write (Burst) Access	Non-multiplexed	Address /Data-multiplexed	AAD-multiplexed

### 7.1.3.9.1 GPMC Timing Parameters Formulas

This section intends to help the user to calculate the GPMC timing bit fields values. Formulas are not listed exhaustively.

The section details:

- NAND Flash Interface Timing Parameters Formulas
- Synchronous NOR Flash Timing Parameters Formulas
- Asynchronous NOR Flash Timing Parameters Formulas

#### 7.1.3.9.1.1 NAND Flash Interface Timing Parameters Formulas

This section lists formulas to use in order to calculate NAND timing parameters. This is the case when GPMC\_CONFIG1\_j[11-10] DEVICETYPE = 2h. [Table 7-42](#) details NAND timing parameters.

**Table 7-42. NAND Formulas Description Table**

Configuration Parameter	Unit	Description
A	ns	Pulse duration - GPMC_WEn valid time
B	ns	Delay time - GPMC_CS <sub>n</sub> valid to GPMC_WEn valid
C	ns	Delay time - GPMC_BE0 <sub>n</sub> _CLE/GPMC_ADV <sub>n</sub> _ALE high to GPMC_WEn valid
D	ns	Delay time - GPMC_AD[15:0] valid to GPMC_WEn valid
E	ns	Delay time - GPMC_WEn invalid to GPMC_AD[15:0] invalid
F	ns	Delay time - GPMC_WEn invalid to GPMC_BE0 <sub>n</sub> _CLE/GPMC_ADV <sub>n</sub> _ALE invalid
G	ns	Delay time - GPMC_WEn invalid to GPMC_CS <sub>n</sub> invalid
H	ns	Cycle time - Write cycle time
I	ns	Delay time - GPMC_CS <sub>n</sub> valid to GPMC_OEn valid
J	ns	Setup time - GPMC_AD[15:0] valid to GPMC_OEn invalid
K	ns	Pulse duration - GPMC_OEn valid time
L	ns	Cycle time - Read cycle time
M	ns	Delay time - GPMC_OEn invalid to GPMC_CS <sub>n</sub> invalid

The configuration parameters are calculated through the following formulas.

$$A = (WEOffTime - WEOnTime) * (TimeParaGranularity + 1) * GPMC\_FCLK \text{ period}$$

$$B = ((WEOnTime - CSOnTime) * (TimeParaGranularity + 1) + 0.5 * (WEEExtraDelay - CSEExtraDelay)) * GPMC\_FCLK \text{ period}$$

$$C = ((WEOnTime - ADVOnTime) * (TimeParaGranularity + 1) + 0.5 * (WEEExtraDelay - ADVExtraDelay)) * GPMC\_FCLK \text{ period}$$

$$D = (WEOnTime * (TimeParaGranularity + 1) + 0.5 * WEEExtraDelay) * GPMC\_FCLK \text{ period}$$

$$E = (WrCycleTime - WEOffTime * (TimeParaGranularity + 1) - 0.5 * WEEExtraDelay) * GPMC\_FCLK \text{ period}$$

$$F = (ADVWrOffTime - WEOffTime * (TimeParaGranularity + 1) + 0.5 * (ADVExtraDelay - WEEExtraDelay)) * GPMC\_FCLK \text{ period}$$

$$G = (CSWrOffTime - WEOffTime * (TimeParaGranularity + 1) + 0.5 * (CSEExtraDelay - WEEExtraDelay)) * GPMC\_FCLK \text{ period}$$

$$H = WrCycleTime * (1 + TimeParaGranularity) * GPMC\_FCLK \text{ period}$$

$$I = ((OEOnTime - CSOnTime) * (TimeParaGranularity + 1) + 0.5 * (OEEExtraDelay - CSEExtraDelay)) * GPMC\_FCLK \text{ period}$$

$$J = ((AccessTime - OEOffTime) * (TimeParaGranularity + 1) - 0.5 * OEEExtraDelay) * GPMC\_FCLK \text{ period}$$

$$K = (\text{OEOffTime} - \text{OEOnTime}) * (1 + \text{TimeParaGranularity}) * \text{GPMC\_FCLK period}$$

$$L = \text{RdCycleTime} * (1 + \text{TimeParaGranularity}) * \text{GPMC\_FCLK period}$$

$$M = (\text{CSRdOffTime} - \text{OEOffTime} * (\text{TimeParaGranularity} + 1) + 0.5 * (\text{CSExtraDelay} - \text{OEExtraDelay}) * \text{GPMC\_FCLK period}$$

Figure 7-44 shows a command latch cycle timing simplified example where formulas are associated with signal waves.

Figure 7-44. NAND Command Latch Cycle Timing Simplified Example

### 7.1.3.9.1.2 Synchronous NOR Flash Timing Parameters Formulas

This section lists all formulas to use in order to calculate synchronous NOR timing parameters. This is the case when GPMC\_CONFIG1\_[11-10] DEVICETYPE = 0 and when READTYPE or WRITETYPE are set to synchronous mode.

Table 7-43. Synchronous NOR Formulas Description Table

Configuration Parameter	Unit	Description
A	ns	Pulse duration - GPMC_CS <sub>n</sub> low
B	ns	Delay time - address bus valid to GPMC_CLK first edge
C	ns	Pulse duration - GPMC_BE0 <sub>n</sub> _CLE/GPMC_BE1 <sub>n</sub> low
D	ns	Delay time - GPMC_CLK rising edge to GPMC_BE0 <sub>n</sub> _CLE/GPMC_BE1 <sub>n</sub> invalid
E	ns	Delay time - GPMC_CLK rising edge to GPMC_CS <sub>n</sub> invalid
F	ns	Delay time - GPMC_CLK rising edge to GPMC_CS <sub>n</sub> transition
G	ns	Delay time - GPMC_CLK rising edge to GPMC_ADV <sub>n</sub> _ALE transition
H	ns	Delay time - GPMC_CLK rising edge to GPMC_OE <sub>n</sub> transition
I	ns	Delay time - GPMC_CLK rising edge to GPMC_WE <sub>n</sub> transition
J	ns	Delay time - GPMC_CLK rising edge to GPMC_AD data bus transition
K	ns	Pulse duration - GPMC_ADV <sub>n</sub> _ALE low
L	ns	Delay time - GPMC_WAIT invalid to first data latching GPMC_CLK edge

The configuration parameters are calculated through the following formulas.

For single read accesses:

$$A = (\text{CSRDOFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$$

$$C = \text{RDCYCLETIME} * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$$

$$D = (\text{RDCYCLETIME} - \text{ACCESSTIME}) * \text{GPMC\_FCLK period}$$

$$E = (\text{CSRDOFFTIME} - \text{ACCESSTIME}) * \text{GPMC\_FCLK period}$$

For burst read accesses (where n is the page burst access number):

$$A = (\text{CSRDOFFTIME} - \text{CSONTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$$

$$C = (\text{RDCYCLETIME} + (n - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$$

$$D = (\text{RDCYCLETIME} - (\text{ACCESSTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME})) * \text{GPMC\_FCLK period}$$

$$E = (\text{CSRDOFFTIME} - (\text{ACCESSTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME})) * \text{GPMC\_FCLK period}$$

For burst write accesses (where n is the page burst access number):

$$A = (\text{CSWROFFTIME} - \text{CSONTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$$

$$C = (\text{WRCYCLETIME} + (n - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$$

$$D = (\text{WRCYCLETIME} - (\text{ACCESSTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME})) * \text{GPMC\_FCLK period}$$

$$E = (\text{CSWROFFTIME} - (\text{ACCESSTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME})) * \text{GPMC\_FCLK period}$$

For all accesses:

For CSn falling edge (CSn activated):

- Case where GPMC\_CONFIG1\_j[1-0] GPMCFCLKDIVIDER = 0x0  
 $F = 0.5 * \text{CSEXTRADELAY} * \text{GPMC\_FCLK period}$
- Case where GPMCFCLKDIVIDER = 0x1  
 $F = 0.5 * \text{CSEXTRADELAY} * \text{GPMC\_FCLK period}$ , when (CLKACTIVATIONTIME and CSONTIME are odd) or (CLKACTIVATIONTIME and CSONTIME are even)  
 $F = (1 + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC\_FCLK period}$  otherwise
- Case where GPMCFCLKDIVIDER = 0x2  
 $F = 0.5 * \text{CSEXTRADELAY} * \text{GPMC\_FCLK period}$ , when (CSONTIME - CLKACTIVATIONTIME) is a multiple of 3  
 $F = (1 + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC\_FCLK period}$ , when (CSONTIME - CLKACTIVATIONTIME - 1) is a multiple of 3  
 $F = (2 + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC\_FCLK period}$ , when (CSONTIME - CLKACTIVATIONTIME - 2) is a multiple of 3

For CSn rising edge (CSn de-activated) in reading mode:

- Case where GPMC\_CONFIG1\_j[1-0] GPMCFCLKDIVIDER = 0x0  
 $F = 0.5 * \text{CSEXTRADELAY} * \text{GPMC\_FCLK period}$
- Case where GPMCFCLKDIVIDER = 0x1  
 $F = 0.5 * \text{CSEXTRADELAY} * \text{GPMC\_FCLK period}$ , when (CLKACTIVATIONTIME and CSRDOFFTIME are odd) or (CLKACTIVATIONTIME and CSRDOFFTIME are even)  
 $F = (1 + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC\_FCLK period}$  otherwise
- Case where GPMCFCLKDIVIDER = 0x2  
 $F = 0.5 * \text{CSEXTRADELAY} * \text{GPMC\_FCLK period}$ , when (CSRDOFFTIME - CLKACTIVATIONTIME) is a multiple of 3  
 $F = (1 + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC\_FCLK period}$ , when (CSRDOFFTIME - CLKACTIVATIONTIME - 1) is a multiple of 3  
 $F = (2 + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC\_FCLK period}$ , when (CSRDOFFTIME -

CLKACTIVATIONTIME - 2) is a multiple of 3

For CSn rising edge (CSn de-activated) in writing mode:

- Case where GPMC\_CONFIG1\_i[1-0] GPMCFCLKDIVIDER = 0x0  
 $F = 0.5 * CSEXTRADELAY * GPMC\_FCLK \text{ period}$
- Case where GPMCFCLKDIVIDER = 0x1  
 $F = 0.5 * CSEXTRADELAY * GPMC\_FCLK \text{ period, when (CLKACTIVATIONTIME and CSWROFFTIME are odd) or (CLKACTIVATIONTIME and CSWROFFTIME are even)}$   
 $F = (1 + 0.5 * CSEXTRADELAY) * GPMC\_FCLK \text{ period otherwise}$
- Case where GPMCFCLKDIVIDER = 0x2  
 $F = 0.5 * CSEXTRADELAY * GPMC\_FCLK \text{ period, when (CSWROFFTIME - CLKACTIVATIONTIME) is a multiple of 3}$   
 $F = (1 + 0.5 * CSEXTRADELAY) * GPMC\_FCLK \text{ period, when (CSWROFFTIME - CLKACTIVATIONTIME - 1) is a multiple of 3}$   
 $F = (2 + 0.5 * CSEXTRADELAY) * GPMC\_FCLK \text{ period, when (CSWROFFTIME - CLKACTIVATIONTIME - 2) is a multiple of 3}$

For ADVn falling edge (ADVn activated):

- Case where GPMC\_CONFIG1\_i[1-0] GPMCFCLKDIVIDER = 0x0  
 $G = 0.5 * ADVEXTRADELAY * GPMC\_FCLK \text{ period}$
- Case where GPMCFCLKDIVIDER = 0x1  
 $G = 0.5 * ADVEXTRADELAY * GPMC\_FCLK \text{ period, when (CLKACTIVATIONTIME and ADVONTIME are odd) or (CLKACTIVATIONTIME and ADVONTIME are even)}$   
 $G = (1 + 0.5 * ADVEXTRADELAY) * GPMC\_FCLK \text{ period otherwise}$
- Case where GPMCFCLKDIVIDER = 0x2  
 $G = 0.5 * ADVEXTRADELAY * GPMC\_FCLK \text{ period, when (ADVONTIME - CLKACTIVATIONTIME) is a multiple of 3}$   
 $G = (1 + 0.5 * ADVEXTRADELAY) * GPMC\_FCLK \text{ period, when (ADVONTIME - CLKACTIVATIONTIME - 1) is a multiple of 3}$   
 $G = (2 + 0.5 * ADVEXTRADELAY) * GPMC\_FCLK \text{ period, when (ADVONTIME - CLKACTIVATIONTIME - 2) is a multiple of 3}$

For ADVn rising edge (ADVn de-activated) in reading mode:

- Case where [1-0] GPMCFCLKDIVIDER = 0x0  
 $G = 0.5 * ADVEXTRADELAY * GPMC\_FCLK \text{ period}$
- Case where GPMCFCLKDIVIDER = 0x1  
 $G = 0.5 * ADVEXTRADELAY * GPMC\_FCLK \text{ period, when (CLKACTIVATIONTIME and ADVRDOFFTIME are odd) or (CLKACTIVATIONTIME and ADVRDOFFTIME are even)}$   
 $G = (1 + 0.5 * ADVEXTRADELAY) * GPMC\_FCLK \text{ period otherwise}$
- Case where GPMCFCLKDIVIDER = 0x2  
 $G = 0.5 * ADVEXTRADELAY * GPMC\_FCLK \text{ period, when (ADVRDOFFTIME - CLKACTIVATIONTIME) is a multiple of 3}$   
 $G = (1 + 0.5 * ADVEXTRADELAY) * GPMC\_FCLK \text{ period, when (ADVRDOFFTIME - CLKACTIVATIONTIME - 1) is a multiple of 3}$   
 $G = (2 + 0.5 * ADVEXTRADELAY) * GPMC\_FCLK \text{ period, when (ADVRDOFFTIME - CLKACTIVATIONTIME - 2) is a multiple of 3}$

For ADVn rising edge (ADVn de-activated) in writing mode:

- Case where [1-0] GPMCFCLKDIVIDER = 0x0  
 $G = 0.5 * ADVEXTRADELAY * GPMC\_FCLK \text{ period}$
- Case where GPMCFCLKDIVIDER = 0x1  
 $G = 0.5 * ADVEXTRADELAY * GPMC\_FCLK \text{ period, when (CLKACTIVATIONTIME and$

ADVWROFFTIME are odd) or (CLKACTIVATIONTIME and ADVWROFFTIME are even)

$G = (1 + 0.5 * ADVEXTRADELAY) * GPMC\_FCLK$  period otherwise

- Case where GPMCFCLKDIVIDER = 0x2

$G = 0.5 * ADVEXTRADELAY * GPMC\_FCLK$  period, when (ADVWROFFTIME - CLKACTIVATIONTIME) is a multiple of 3

$G = (1 + 0.5 * ADVEXTRADELAY) * GPMC\_FCLK$  period, when (ADVWROFFTIME - CLKACTIVATIONTIME - 1) is a multiple of 3

$G = (2 + 0.5 * ADVEXTRADELAY) * GPMC\_FCLK$  period, when (ADVWROFFTIME - CLKACTIVATIONTIME - 2) is a multiple of 3

For OEn falling edge (OEn activated):

- Case where GPMC\_CONFIG1\_i[1-0] GPMCFCLKDIVIDER = 0x0

$H = 0.5 * OEEXTRADELAY * GPMC\_FCLK$  period

- Case where GPMCFCLKDIVIDER = 0x1

$H = 0.5 * OEEXTRADELAY * GPMC\_FCLK$  period, when (CLKACTIVATIONTIME and OEONTIME are odd) or (CLKACTIVATIONTIME and OEONTIME are even)

$H = (1 + 0.5 * OEEXTRADELAY) * GPMC\_FCLK$  period otherwise

- Case where GPMCFCLKDIVIDER = 0x2

$H = 0.5 * OEEXTRADELAY * GPMC\_FCLK$  period, when (OEONTIME - CLKACTIVATIONTIME) is a multiple of 3

$H = (1 + 0.5 * OEEXTRADELAY) * GPMC\_FCLK$  period, when (OEONTIME - CLKACTIVATIONTIME - 1) is a multiple of 3

$H = (2 + 0.5 * OEEXTRADELAY) * GPMC\_FCLK$  period, when (OEONTIME - CLKACTIVATIONTIME - 2) is a multiple of 3

For OEn rising edge (OEn de-activated):

- Case where [1-0] GPMCFCLKDIVIDER = 0x0

$H = 0.5 * OEEXTRADELAY * GPMC\_FCLK$  period

- Case where GPMCFCLKDIVIDER = 0x1

$H = 0.5 * OEEXTRADELAY * GPMC\_FCLK$  period, when (CLKACTIVATIONTIME and OEOFFTIME are odd) or (CLKACTIVATIONTIME and OEOFFTIME are even)

$H = (1 + 0.5 * OEEXTRADELAY) * GPMC\_FCLK$  period otherwise

- Case where GPMCFCLKDIVIDER = 0x2

$H = 0.5 * OEEXTRADELAY * GPMC\_FCLK$  period, when (OEOFFTIME - CLKACTIVATIONTIME) is a multiple of 3

$H = (1 + 0.5 * OEEXTRADELAY) * GPMC\_FCLK$  period, when (OEOFFTIME - CLKACTIVATIONTIME - 1) is a multiple of 3

$H = (2 + 0.5 * OEEXTRADELAY) * GPMC\_FCLK$  period, when (OEOFFTIME - CLKACTIVATIONTIME - 2) is a multiple of 3

For WEn falling edge (WEn activated):

- Case where GPMC\_CONFIG1\_i[1-0] GPMCFCLKDIVIDER = 0x0

$I = 0.5 * WEEXTRADELAY * GPMC\_FCLK$  period

- Case where GPMCFCLKDIVIDER = 0x1

$I = 0.5 * WEEXTRADELAY * GPMC\_FCLK$  period, when (CLKACTIVATIONTIME and WEONTIME are odd) or (CLKACTIVATIONTIME and WEONTIME are even)

$I = (1 + 0.5 * WEEXTRADELAY) * GPMC\_FCLK$  period otherwise

- Case where GPMCFCLKDIVIDER = 0x2

$I = 0.5 * WEEXTRADELAY * GPMC\_FCLK$  period, when (WEONTIME - CLKACTIVATIONTIME) is a multiple of 3

$I = (1 + 0.5 * WEEXTRADELAY) * GPMC\_FCLK$  period, when (WEONTIME - CLKACTIVATIONTIME -

1) is a multiple of 3

$I = (2 + 0.5 * WEEXTRADELAY) * GPMC\_FCLK$  period, when  $(WEONTIME - CLKACTIVATIONTIME - 2)$  is a multiple of 3

For WEn rising edge (WEn de-activated):

- Case where [1-0] GPMCFCLKDIVIDER = 0x0  
 $I = 0.5 * WEEXTRADELAY * GPMC\_FCLK \text{ period}$
- Case where GPMCFCLKDIVIDER = 0x1  
 $I = 0.5 * WEEXTRADELAY * GPMC\_FCLK \text{ period, when (CLKACTIVATIONTIME and WEOFFTIME are odd) or (CLKACTIVATIONTIME and WEOFFTIME are even)}$   
 $I = (1 + 0.5 * WEEXTRADELAY) * GPMC\_FCLK \text{ period otherwise}$
- Case where GPMCFCLKDIVIDER = 0x2  
 $I = 0.5 * WEEXTRADELAY * GPMC\_FCLK \text{ period, when (WEOFFTIME - CLKACTIVATIONTIME) is a multiple of 3}$   
 $I = (1 + 0.5 * WEEXTRADELAY) * GPMC\_FCLK \text{ period, when (WEOFFTIME - CLKACTIVATIONTIME - 1) is a multiple of 3}$   
 $I = (2 + 0.5 * WEEXTRADELAY) * GPMC\_FCLK \text{ period, when (WEOFFTIME - CLKACTIVATIONTIME - 2) is a multiple of 3}$

For GPMC\_ADVn low pulse duration:

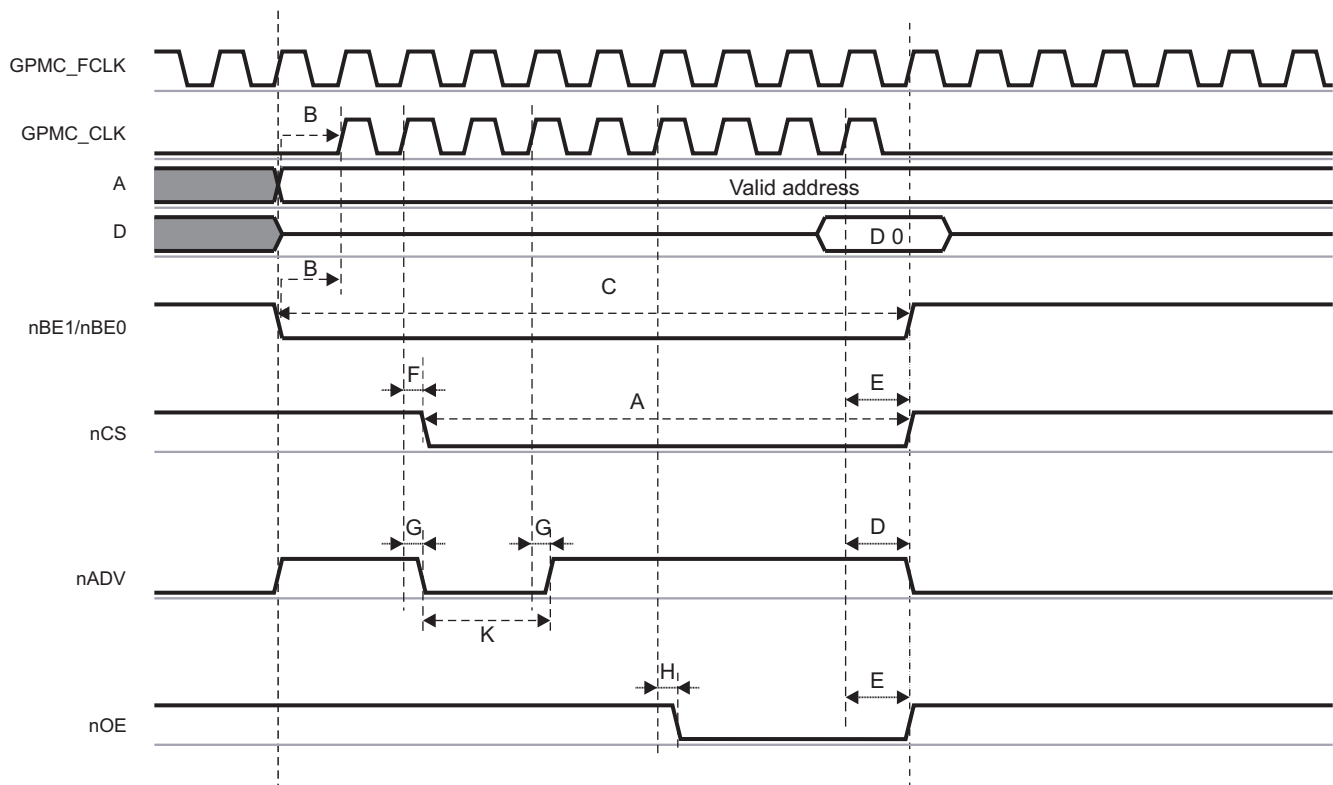

- Read operation  
 $K = (ADVRDOFFTIME - ADVONTIME) * (TIMEPARAGRANULARITY + 1) * GPMC\_FCLK \text{ period}$
- Write operation  
 $K = (ADVWROFFTIME - ADVONTIME) * (TIMEPARAGRANULARITY + 1) * GPMC\_FCLK \text{ period}$

For GPMC\_WAIT invalid to first data latching GPMC\_CLK edge:

$$L = WAITMONITORINGTIME * (GPMCFCLKDIVIDER + 1) * GPMC\_FCLK \text{ period} + GPMC\_CLK \text{ period}$$

Figure 7-45 shows a synchronous NOR single read simplified example where formulas are associated with signal waves.

**Figure 7-45. Synchronous NOR Single Read Simplified Example**

### 7.1.3.9.1.3 Asynchronous NOR Flash Timing Parameters Formulas

This section lists all formulas to use in order to calculate asynchronous NOR timing parameters. This is the case when [11-10] DEVICETYPE = 0x0 and when READTYPE or WRITETYPE are set to asynchronous mode.

**Table 7-44. Asynchronous NOR Formulas Description Table**

Configuration Parameter	Unit	Description
A	ns	Pulse duration - GPMC_CS <sub>n</sub> low
B	ns	Delay time - GPMC_CS <sub>n</sub> valid to GPMC_ADV <sub>n</sub> _ALE invalid
C	ns	Delay time - GPMC_CS <sub>n</sub> valid to GPMC_OE <sub>n</sub> invalid (single read)
D	ns	Pulse duration - address bus valid - 2nd, 3rd and 4th accesses
E	ns	Delay time - GPMC_CS <sub>n</sub> valid to GPMC_WE <sub>n</sub> valid
F	ns	Delay time - GPMC_CS <sub>n</sub> valid to GPMC_WE <sub>n</sub> invalid
G	ns	Address invalid duration between 2 successive R/W accesses
H	ns	Setup time - read data valid before GPMC_OE <sub>n</sub> high
I	ns	Delay time - GPMC_CS <sub>n</sub> valid to GPMC_OE <sub>n</sub> invalid (burst read)
J	ns	Delay time - address bus valid to GPMC_CS <sub>n</sub> valid
		Delay time - data bus valid to GPMC_CS <sub>n</sub> valid
		Delay time - GPMC_BE0 <sub>n</sub> _CLE/GPMC_BE1 <sub>n</sub> valid to GPMC_CS <sub>n</sub> valid
K	ns	Delay time - GPMC_CS <sub>n</sub> valid to GPMC_ADV <sub>n</sub> _ALE valid
L	ns	Delay time - GPMC_CS <sub>n</sub> valid to GPMC_OE <sub>n</sub> valid
M	ns	Delay time - GPMC_CS valid to first data latching edge
N	ns	Pulse duration - GPMC_BE0 <sub>n</sub> _CLE/GPMC_BE1 <sub>n</sub> valid time
O	ns	Delay time - GPMC_CS <sub>n</sub> valid to GPMC_ADV <sub>n</sub> _ALE valid

The configuration parameters are calculated through the following formulas. Note that these formulas are not exhaustive.

GPMC\_CS<sub>n</sub> low pulse:

For single read:  $A = (CSRDOFFTIME - CSONTIME) * (TIMEPARAGRANULARITY + 1) * GPMC\_FCLK \text{ period}$

For burst read:  $A = (CSRDOFFTIME - CSONTIME + (N - 1) * PAGEBURSTACCESSTIME) * (TIMEPARAGRANULARITY + 1) * GPMC\_FCLK \text{ period}$ , where N = page burst access number

For single write:  $A = (CSWROFFTIME - CSONTIME) * (TIMEPARAGRANULARITY + 1) * GPMC\_FCLK \text{ period}$

For burst write:  $A = (CSWROFFTIME - CSONTIME + (N - 1) * PAGEBURSTACCESSTIME) * (TIMEPARAGRANULARITY + 1) * GPMC\_FCLK \text{ period}$ , where N = page burst access number

GPMC\_CS<sub>n</sub> valid to GPMC\_ADV<sub>n</sub>\_ALE invalid delay:

For reading:  $B = ((ADVRDOFFTIME - CSONTIME) * (TIMEPARAGRANULARITY + 1) + 0.5 * (ADVEXTRADELAY - CSEXTRADELAY)) * GPMC\_FCLK \text{ period}$

For writing:  $B = ((ADVWROFFTIME - CSONTIME) * (TIMEPARAGRANULARITY + 1) + 0.5 * (ADVEXTRADELAY - CSEXTRADELAY)) * GPMC\_FCLK \text{ period}$

$C = ((OEOFFTIME - CSONTIME) * (TIMEPARAGRANULARITY + 1) + 0.5 * (OEEXTRADELAY - CSEXTRADELAY)) * GPMC\_FCLK \text{ period}$

$D = PAGEBURSTACCESSTIME * (TIMEPARAGRANULARITY + 1) * GPMC\_FCLK \text{ period}$

$E = ((WEONTIME - CSONTIME) * (TIMEPARAGRANULARITY + 1) + 0.5 * (WEEXTRADELAY - CSEXTRADELAY)) * GPMC\_FCLK \text{ period}$

$F = ((WEOFFTIME - CSONTIME) * (TIMEPARAGRANULARITY + 1) + 0.5 * (WEEXTRADELAY - CSEXTRADELAY)) * GPMC\_FCLK \text{ period}$

$G = CYCLE2CYCLEDELAY * GPMC\_FCLK \text{ period}$

$$H = ((\text{OEOFFTIME} - \text{ACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * \text{OEEXTRADELAY}) * \text{GPMC\_FCLK period}$$

$$I = ((\text{OEOFFTIME} + (N - 1) * \text{PAGEBURSTACCESSTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{OEEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC\_FCLK period, where } N = \text{page burst access number}$$

$$J = (\text{CSONTIME} * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC\_FCLK period}$$

$$K = ((\text{ADVONTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{ADVEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC\_FCLK period}$$

$$L = ((\text{OEONTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{OEEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC\_FCLK period}$$

$$M = ((\text{ACCESSTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) - 0.5 * \text{CSEXTRADELAY}) * \text{GPMC\_FCLK period}$$

GPMC\_BE0n\_CLE/GPMC\_BE1n pulse:

For single read:  $N = \text{RDCYCLETIME} * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$

For burst read:  $N = (\text{RDCYCLETIME} + (N - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period, where } N = \text{page burst access number}$

For burst write:  $N = (\text{WRCYCLETIME} + (N - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period, where } N = \text{page burst access number}$

$$O = ((\text{WRCYCLETIME} + (N - 1) * \text{PAGEBURSTACCESSTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{ADVEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC\_FCLK period}$$

Figure 7-46 shows an asynchronous NOR single write simplified example where formulas are associated with signal waves.

**Figure 7-46. Asynchronous NOR Single Write Simplified Example**

Write multiple access is not supported in asynchronous mode. If WRITEMULTIPLE is enabled with WRITETYPE as asynchronous, the GPMC processes single asynchronous accesses.

## 7.1.4 Use Cases

### 7.1.4.1 How to Set GPMC Timing Parameters for Typical Accesses

#### 7.1.4.1.1 External Memory Attached to the GPMC Module

As discussed in the introduction to this chapter, the GPMC module supports the following external memory types:

- Asynchronous or synchronous, 8-bit or 16-bit-width memory or device
- 16-bit address/data-multiplexed or not multiplexed NOR flash device
- 8- or 16-bit NAND flash device

The following examples show how to calculate GPMC timing parameters by showing a typical parameter setup for the access to be performed.

The example is based on a 512-Mb multiplexed NOR flash memory with the following characteristics:

- Type: NOR flash (address/data-multiplexed mode)
- Size: 512M bits
- Data Bus: 16 bits wide
- Speed: 104 MHz clock frequency
- Read access time: 80 ns

#### 7.1.4.1.2 Typical GPMC Setup

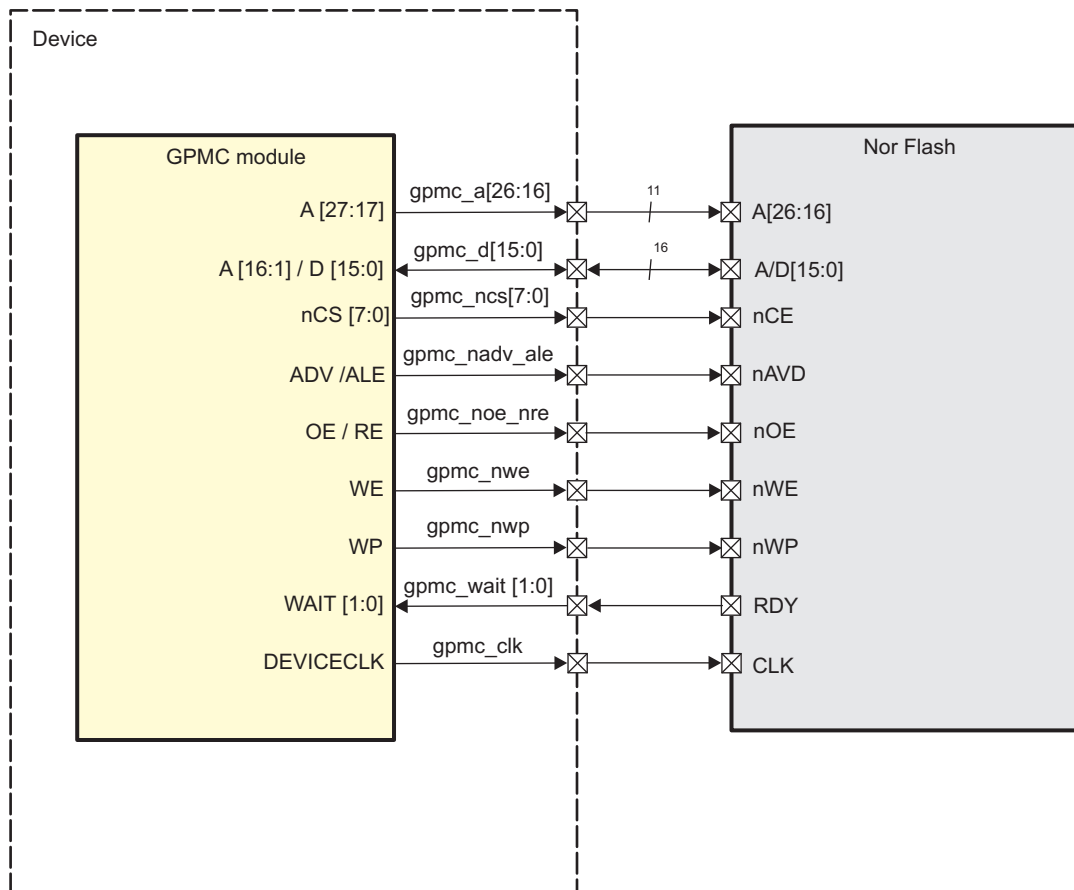

[Table 7-45](#) lists some of the I/Os of the GPMC module.

**Table 7-45. GPMC Signals**

Signal Name	I/O	Description
GPMC_FCLK	Internal	Functional and interface clock. Acts as the time reference.
GPMC_CLK	O	External clock provided to the external device for synchronous operations
GPMC_A[27:17]	O	Address
GPMC_AD[15: 0]	I/O	Data-multiplexed with addresses A[16:1] on memory side
GPMC_CSx <sub>n</sub>	O	Chip-select (where x = 0, or 1)
GPMC_ADV <sub>n</sub> _ALE	O	Address valid enable
GPMC_OE_RE <sub>n</sub>	O	Output enable (read access only)
GPMC_WE <sub>n</sub>	O	Write enable (write access only)
GPMC_WAIT[1:0]	I	Ready signal from memory device. Indicates when valid burst data is ready to be read

Figure 7-47 shows the typical connection between the GPMC module and an attached NOR Flash memory.

**Figure 7-47. GPMC Connection to an External NOR Flash Memory**

The following sections demonstrate how to calculate GPMC parameters for three access types:

- Synchronous burst read
- Asynchronous read
- Asynchronous single write

### 7.1.4.1.3 GPMC Configuration for Synchronous Burst Read Access

The clock runs at 104 MHz ( $f = 104 \text{ MHz}$ ;  $T = 9,615 \text{ ns}$ ).

Table 7-46 shows the timing parameters (on the memory side) that determine the parameters on the GPMC side.

Table 7-47 shows how to calculate timings for the GPMC using the memory parameters.

Figure 7-48 shows the synchronous burst read access.

**Table 7-46. Useful Timing Parameters on the Memory Side**

AC Read Characteristics on the Memory Side	Description	Duration (ns)
tCES	CSn setup time to clock	0
tACS	Address setup time to clock	3
tIACC	Synchronous access time	80
tBACC	Burst access time valid clock to output delay	5,2
tCEZ	Chip-select to High-Impedance	7
tOEZ	Output enable to High-Impedance	7
tAVC	ADVn setup time	6
tAVD	AVDn pulse	6
tACH	Address hold time from clock	3

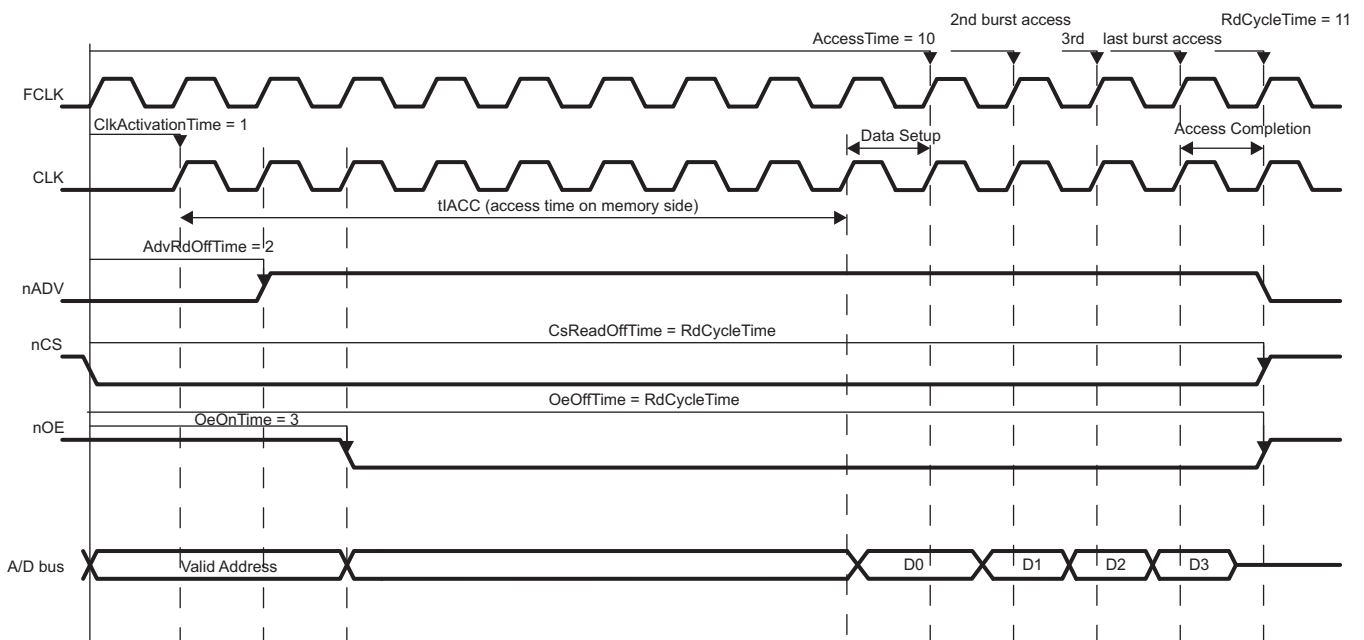

The following terms, which describe the timing interface between the controller and its attached device, are used to calculate the timing parameters on the GPMC side:

- Read Access time (GPMC side): Time required to activate the clock + read access time requested on the memory side + data setup time required for optimal capture of a burst of data
- Data setup time (GPMC side): Ensures a good capture of a burst of data (as opposed to taking a burst of data out). One word of data is processed in one clock cycle ( $T = 9,615 \text{ ns}$ ). The read access time between 2 bursts of data is  $tBACC = 5,2 \text{ ns}$ . Therefore, data setup time is a clock period -  $tBACC = 4,415 \text{ ns}$  of data setup.
- Access completion (GPMC side): (Different from page burst access time) Time required between the last burst access and access completion: CSn/OEn hold time (CSn and OEn must be released at the end of an access. These signals are held to allow the access to complete).
- Read cycle time (GPMC side): Read Access time + access completion
- Write cycle time for burst access: Not supported for NOR flash memory

**Table 7-47. Calculating GPMC Timing Parameters**

Parameter Name on GPMC Side	Formula	Duration (ns)	Number of Clock Cycles (F = 104 MHz)	GPMC Register Configurations
GPMC FCLK Divider	-	-	-	GPMCFCLKDIVIDER = 0
ClkActivationTime	$\min (t_{CES}, t_{ACS})$	3	1	CLKACTIVATIONTIME = 1
RdAccessTime	$\text{roundmax} (\text{ClkActivationTime} + t_{IACC} + \text{DataSetupTime})$	94,03: (9,615 + 80 + 4,415)	10 : $\text{roundmax} (94,03 / 9,615)$	ACCESSTIME = Ah
PageBurstAccessTime	$\text{roundmax} (t_{BACC})$	$\text{roundmax} (5,2)$	1	PAGEBURSTACCESSTIME = 1
RdCycleTime	$\text{AccessTime} + \max (t_{CEZ}, t_{OEZ})$	101, 03: (94, 03 + 7)	11	RDCYCLETIME = Bh
CsOnTime	tCES	0	0	CSONTIME = 0
CsReadOffTime	RdCycleTime	-	11	CSRDOFFTIME = Bh
AdvOnTime	tAVC	0	0	ADVONTIME = 0
AdvRdOffTime	tAVD + tAVC	12	2	ADVRDOFFTIME = 2h
OeOnTime	$(\text{ClkActivationTime} + t_{ACH}) < \text{OeOnTime} < (\text{ClkActivationTime} + t_{IACC})$	-	3, for instance	OEONTIME = 3h
OeOffTime	RdCycleTime	-	11	OEOFFTIME = Bh

**Figure 7-48. Synchronous Burst Read Access (Timing Parameters in Clock Cycles)**

#### 7.1.4.1.4 GPMC Configuration for Asynchronous Read Access

The clock runs at 104 MHz (  $f = 104 \text{ MHz}$ ;  $T = 9,615 \text{ ns}$ ).

Table 7-48 shows the timing parameters (on the memory side) that determine the parameters on the GPMC side.

Table 7-49 shows how to calculate timings for the GPMC using the memory parameters.

Figure 7-49 shows the asynchronous read access.

**Table 7-48. AC Characteristics for Asynchronous Read Access**

AC Read Characteristics on the Memory Side	Description	Duration (ns)
tCE	Read Access time from CSn low	80
tAAVDS	Address setup time to rising edge of ADVn	3
tAVDP	ADVn low time	6
tCAS	CSn setup time to ADVn	0
tOE	Output enable to output valid	6
tOEZ	Output enable to High-Impedance	7

Use the following formula to calculate the RdCycleTime parameter for this typical access:

$$\text{RdCycleTime} = \text{RdAccessTime} + \text{AccessCompletion} = \text{RdAccessTime} + 1 \text{ clock cycle} + \text{tOEZ}$$

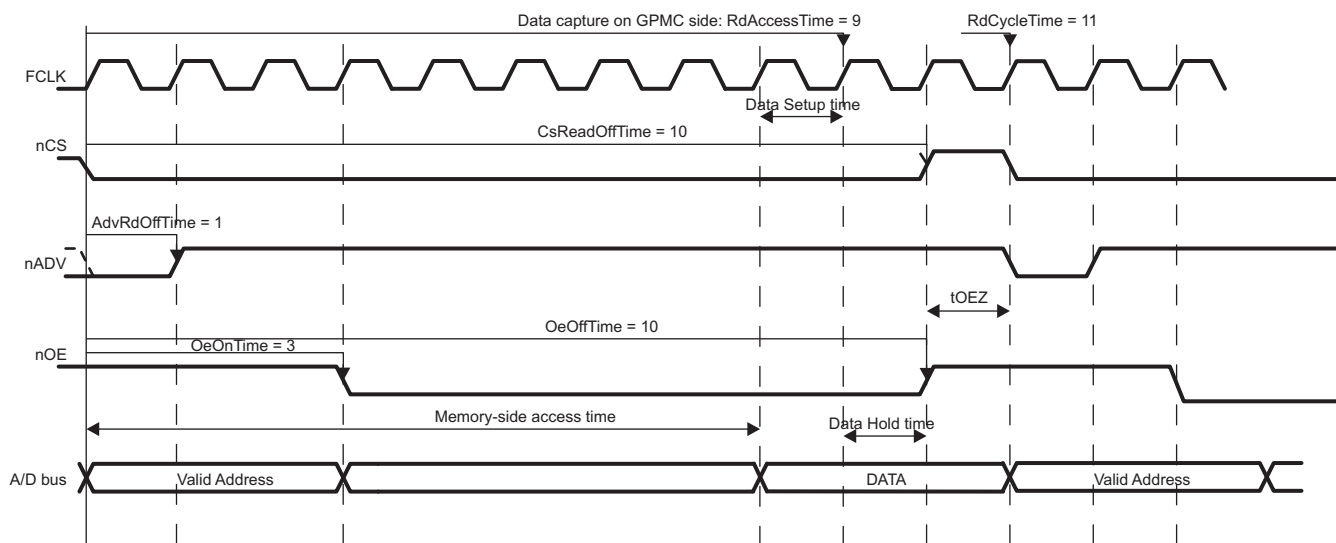

- First, on the memory side, the external memory makes the data available to the output bus. This is the memory-side read access time defined in Table 7-49: the number of clock cycles between the address capture (ADVn rising edge) and the data valid on the output bus.

The GPMC requires some hold time to allow the data to be captured correctly and the access to be finished.

- To read the data correctly, the GPMC must be configured to meet the data setup time requirement of the memory; the GPMC module captures the data on the next rising edge. This is access time on the GPMC side.
- There must also be a data hold time for correctly reading the data (checking that there is no OEn/CSn deassertion while reading the data). This data hold time is 1 clock cycle (that is, AccessTime + 1).
- To complete the access, OEn/CSn signals are driven to high-impedance. AccessTime + 1 + tOEZ is the read cycle time.
- Addresses can now be relatched and a new read cycle begun.

**Table 7-49. GPMC Timing Parameters for Asynchronous Read Access**

Parameter Name on GPMC side	Formula	Duration (ns)	Number of Clock Cycles (F = 104 MHz)	GPMC Register Configurations
ClkActivationTime	n/a (asynchronous mode)			
AccessTime	round max (tCE)	80	9	ACCESSTIME = 9h
PageBurstAccessTime	n/a (single access)			
RdCycleTime	AccessTime + 1 cycle + tOEZ	96, 615	11	RDCYCLETIME = Bh
CsOnTime	tCAS	0	0	CSONTIME = 0
CsReadOffTime	AccessTime + 1 cycle	89, 615	10	CSRDOFFTIME = Ah
AdvOnTime	tAAVDS	3	1	ADVONTIME = 1
AdvRdOffTime	tAAVDS + tAVDP	9	1	ADVRDOFFTIME = 1
OeOnTime	OeOnTime ≥ AdvRdOffTime (multiplexed mode)	-	3, for instance	OEONTIME = 3h
OeOffTime	AccessTime + 1 cycle	89, 615	10	OEOFFTIME = Ah

**Figure 7-49. Asynchronous Single Read Access (Timing Parameters in Clock Cycles)**

### 7.1.4.1.5 GPMC Configuration for Asynchronous Single Write Access

The clock runs at 104 MHz: ( $f = 104 \text{ MHz}$ ;  $T = 9,615 \text{ ns}$ ).

[Table 7-50](#) shows how to calculate timings for the GPMC using the memory parameters.

[Table 7-51](#) shows the timing parameters (on the memory side) that determine the parameters on the GPMC side.

[Figure 7-50](#) shows the synchronous burst write access.

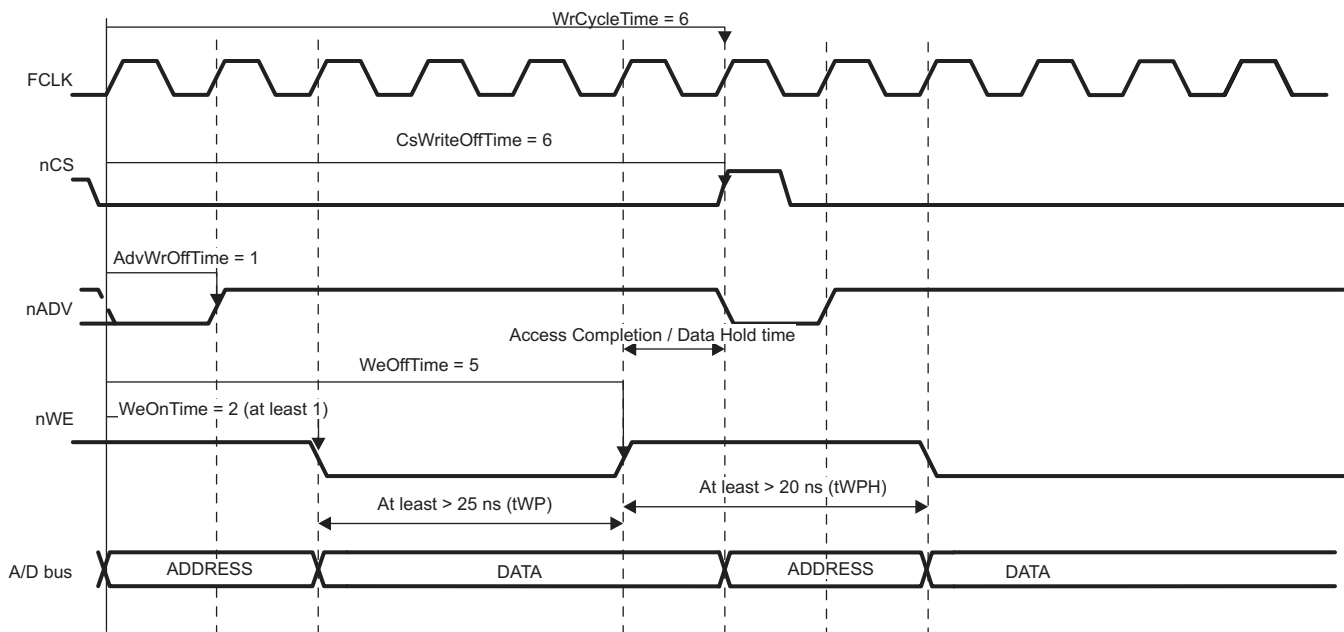

**Table 7-50. AC Characteristics for Asynchronous Single Write (Memory Side)**

AC Characteristics on the Memory Side	Description	Duration (ns)
tWC	Write cycle time	60
tAVDP	ADVn low time	6
tWP	Write pulse width	25
tWPH	Write pulse width high	20
tCS	CSn setup time to WEn	3
tCAS	CSn setup time to ADVn	0
tAVSC	ADVn setup time	3

For asynchronous single write access, write cycle time is  $WrCycleTime = WeOffTime + AccessCompletion = WeOffTime + 1$ . For the AccessCompletion, the GPMC requires 1 cycle of data hold time (CSn de-assertion).

**Table 7-51. GPMC Timing Parameters for Asynchronous Single Write**

Parameter Name on GPMC side	Formula	Duration (ns)	Number of Clock Cycles (F = 104 MHz)	GPMC Register Configurations
ClkActivationTime	n/a (asynchronous mode)			
AccessTime	Applicable only to WAITMONITORING (the value is the same as for read access)			
PageBurstAccessTime	n/a (single access)			
WrCycleTime	WeOffTime + AccessCompletion	57, 615	6	WRCYCLETIME = 6h
CsOnTime	tCAS	0	0	CSONTIME = 0
CsWrOffTime	WeOffTime + 1	57, 615	6	CSWROFFTIME = 6h
AdvOnTime	tAVSC	3	1	ADVONTIME = 1
AdvWrOffTime	tAVSC + tAVDP	9	1	ADVWROFFTIME = 1

### 7.1.4.2 How to Choose a Suitable Memory to Use With the GPMC

This section is intended to help the user select a suitable memory device to interface with the GPMC controller.

#### 7.1.4.2.1 Supported Memories or Devices

NAND flash and NOR flash architectures are the two flash technologies. The GPMC supports various types of external memory or device, basically any one that supports NAND or NOR protocols:

- 8- and 16-bit width asynchronous or synchronous memory or device (8-bit: non burst device only)
- 16-bit address and data multiplexed NOR flash devices (pSRAM)
- 8- and 16-bit NAND flash device

#### 7.1.4.2.2 NAND Interface Protocol

NAND flash architecture, introduced in 1989, is a flash technology. NAND is a page-oriented memory device, that is, read and write accesses are done by pages. NAND achieves great density by sharing common areas of the storage transistor, which creates strings of serially connected transistors (in NOR devices, each transistor stands alone). Thanks to its high density NAND is best suited to devices requiring high capacity data storage, such as pictures, music, or data files. NAND non-volatility, makes of it a good storage solution for many applications where mobility, low power, and speed are key factors. Low pin count and simple interface are other advantages of NAND.

Table 7-52 summarizes the NAND interface signals level applied to external device or memories.

**Table 7-52. NAND Interface Bus Operations Summary**

Bus Operation	CLE	ALE	CEn	WEn	REn	WPn
Read (cmd input)	H	L	L	RE	H	x
Read (add input)	L	H	L	RE	H	x
Write (cmd input)	H	L	L	RE	H	H
Write (add input)	L	H	L	RE	H	H
Data input	L	L	L	RE	H	H
Data output	L	L	L	H	FE	x
Busy (during read)	x	x	H	H	H	x
Busy (during program)	x	x	x	x	x	H
Busy (during erase)	x	x	x	x	x	H
Write protect	x	x	x	x	x	L
Stand-by	x	x	H	x	x	H/L

#### 7.1.4.2.3 NOR Interface Protocol

NOR flash architecture, introduced in 1988, is a flash technology. Unlike NAND, which is a sequential access device, NOR is directly addressable; i.e., it is designed to be a random access device. NOR is best suited to devices used to store and run code or firmware, usually in small capacities. While NOR has fast read capabilities it has slow write and erase functions compared to NAND architecture.

Table 7-53 summarizes the NOR interface signals level applied to external device or memories.

**Table 7-53. NOR Interface Bus Operations Summary**

Bus Operation	CLK	ADVn	CSn	OEn	WEn	WAIT	DQ[15:0]
Read (asynchronous)	x	L	L	L	H	Asserted	Output
Read (synchronous)	Running	L	L	L	H	Driven	Output
Read (burst suspend)	Halted	x	L	H	H	Active	Output
Write	x	L	L	H	L	Asserted	Input

**Table 7-53. NOR Interface Bus Operations Summary (continued)**

Bus Operation	CLK	ADVn	CSn	OEn	WEn	WAIT	DQ[15:0]
Output disable	x	x	L	H	H	Asserted	High-Z
Standby	x	x	H	x	x	High-Z	High-Z

#### 7.1.4.2.4 Other Technologies

Other supported device type interact with the GPMC through the NOR interface protocol.

OneNAND Flash is a high-density and low-power memory device. It is based on single- or multi-level-cell NAND core with SRAM and logic, and interfaces as a synchronous NOR Flash, plus has synchronous write capability. It reads faster than conventional NAND and writes faster than conventional NOR flash. Hence, it is appropriate for both mass storage and code storage.

pSRAM stands for pseudo-static random access memory. pSRAM is a low-power memory device for mobile applications. pSRAM is based on the DRAM cell with internal refresh and address control features, and interfaces as a synchronous NOR Flash, plus has synchronous write capability.

#### 7.1.4.2.5 Supported Protocols

The GPMC supports the following interface protocols when communicating with external memory or external devices:

- Asynchronous read/write access
- Asynchronous read page access (4-8-16 Word16)
- Synchronous read/write access
- Synchronous read burst access without wrap capability (4-8-16 Word16)
- Synchronous read burst access with wrap capability (4-8-16 Word16)

#### 7.1.4.2.6 GPMC Features and Settings

This section lists GPMC features and settings:

- Supported device type: up to four NAND or NOR protocol external memories or devices
- Operating Voltage: 3.3V
- Maximum GPMC addressing capability: 512 MBytes divided into eight chip-selects
- Maximum supported memory size: 256 MBytes (must be a power-of-2)
- Minimum supported memory size: 16 MBytes (must be a power-of-2). Aliasing occurs when addressing smaller memories.
- Data path to external memory or device: 8- and 16-bit wide
- Burst and page access: burst of 4-8-16 Word16
- Supports bus keeping
- Supports bus turn around

## 7.1.5 Registers

Table 7-54 provides a summary of the GPMC registers. All GPMC registers are aligned to 32-bit address boundaries. All register file accesses, except the GPMC\_NAND\_DATA\_i register, are little-endian. If the GPMC\_NAND\_DATA\_i register is accessed, the endianness is access-dependent.

In this section, i corresponds to the chip-select number, i = 0 to 6.

**Table 7-54. GPMC Registers**

### 7.1.5.1 GPMC\_REVISION

This register contains the IP revision code.

**Figure 7-51. GPMC\_REVISION**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-55. GPMC\_REVISION Field Descriptions**

Bit	Field	Value	Description
31-8	Reserved	0	Reserved
7-0	REV	0-FFh	IP revision. Major revision is [7-4]. Minor revision is [3-0]. Examples: 10h for revision 1.0, 21h for revision 2.1.

### 7.1.5.2 GPMC\_SYSCONFIG

This register controls the various parameters of the OCP interface.

**Figure 7-52. GPMC\_SYSCONFIG**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-56. GPMC\_SYSCONFIG Field Descriptions**

Bit	Field	Value	Description
31-5	Reserved	0	Reserved
4-3	SIDLEMODE	0	Force-idle. An idle request is acknowledged unconditionally
		1h	No-idle. An idle request is never acknowledged
		2h	Smart-idle. Acknowledgement to an idle request is given based on the internal activity of the module
		3h	Reserved
2	Reserved	0	Reserved
1	SOFTRESET		Software reset (Set 1 to this bit triggers a module reset. This bit is automatically reset by hardware. During reads, it always returns 0)
		0	Normal mode
		1	The module is reset
0	AUTOIDLE		Internal OCP clock gating strategy
		0	Interface clock is free-running
		1	Reserved

### 7.1.5.3 GPMC\_SYSSTATUS

This register provides status information about the module, excluding the interrupt status information.

**Figure 7-53. GPMC\_SYSSTATUS**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-57. GPMC\_SYSSTATUS Field Descriptions**

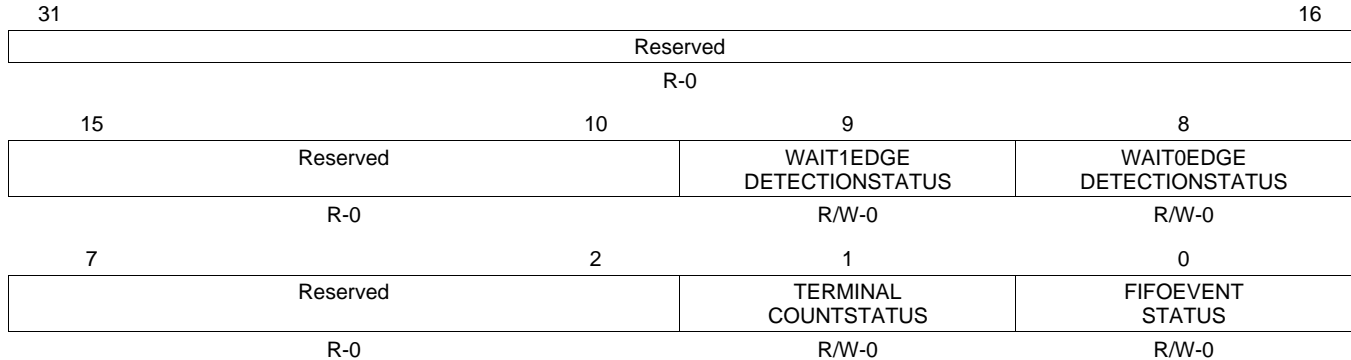

Bit	Field	Value	Description
31-1	Reserved	0	Reserved
0	RESETDONE	R0	Internal reset monitoring
		R0	Internal module reset in on-going
		R1	Reset completed

### 7.1.5.4 GPMC\_IRQSTATUS

This interrupt status register regroups all the status of the module internal events that can generate an interrupt.

**Figure 7-54. GPMC\_IRQSTATUS**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

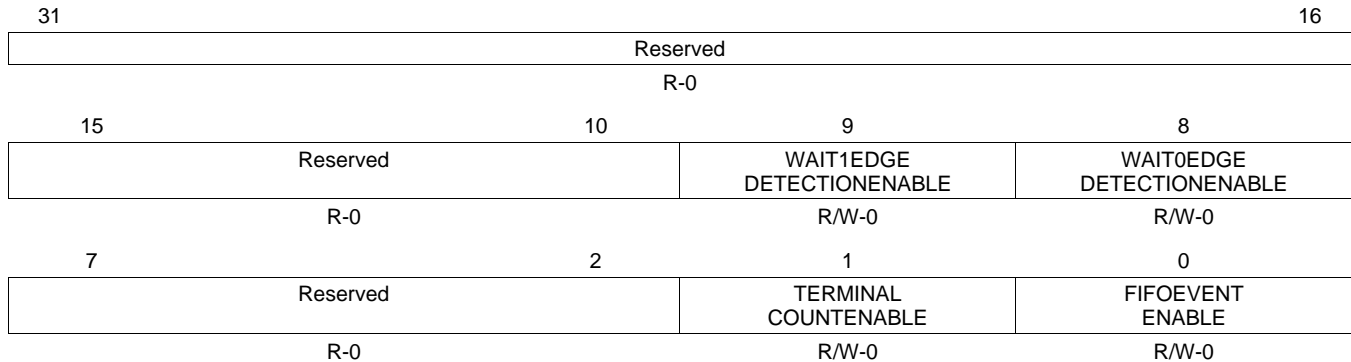

**Table 7-58. GPMC\_IRQSTATUS Field Descriptions**

Bit	Field	Value	Description
31-10	Reserved	0	Reserved
9	WAIT1EDGEDETECTIONSTATUS	R0 W0 R1 W1	Status of the Wait1 Edge Detection interrupt A transition on WAIT1 input pin has not been detected WAIT1EDGEDETECTIONSTATUS bit unchanged A transition on WAIT1 input pin has been detected WAIT1EDGEDETECTIONSTATUS bit is reset
8	WAIT0EDGEDETECTIONSTATUS	R0 W0 R1 W1	Status of the Wait0 Edge Detection interrupt A transition on WAIT0 input pin has not been detected WAIT0EDGEDETECTIONSTATUS bit unchanged A transition on WAIT0 input pin has been detected WAIT0EDGEDETECTIONSTATUS bit is reset
7-2	Reserved	0	Reserved
1	TERMINALCOUNTSTATUS	R0 W0 R1 W1	Status of the TerminalCountEvent interrupt Indicates that CountValue is greater than 0 TERMINALCOUNTSTATUS bit unchanged Indicates that CountValue is equal to 0 TERMINALCOUNTSTATUS bit is reset
0	FIFOEVENTSTATUS	R0 W0 R1 W1	Status of the FIFOEvent interrupt Indicates than less than GPMC_PREFETCH_STATUS[16] FIFOTHRESHOLDSTATUS bytes are available in prefetch mode and less than FIFOTHRESHOLD bytes free places are available in write-posting mode. FIFOEVENTSTATUS bit unchanged Indicates than at least GPMC_PREFETCH_STATUS[16] FIFOTHRESHOLDSTATUS bytes are available in prefetch mode and at least FIFOTHRESHOLD bytes free places are available in write-posting mode. FIFOEVENTSTATUS bit is reset

### 7.1.5.5 GPMC\_IRQENABLE

The interrupt enable register allows to mask/unmask the module internal sources of interrupt, on a event-by-event basis.

**Figure 7-55. GPMC\_IRQENABLE**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-59. GPMC\_IRQENABLE Field Descriptions**

Bit	Field	Value	Description
31-10	Reserved	0	Reserved
9	WAIT1EDGEDETECTIONENABLE	0 1	Enables the Wait1 Edge Detection interrupt 0 Wait1EdgeDetection interrupt is masked 1 Wait1EdgeDetection event generates an interrupt if occurs
8	WAIT0EDGEDETECTIONENABLE	0 1	Enables the Wait0 Edge Detection interrupt 0 Wait0EdgeDetection interrupt is masked 1 Wait0EdgeDetection event generates an interrupt if occurs
7-2	Reserved	0	Reserved
1	TERMINALCOUNTEVENTENABLE	0 1	Enables TerminalCountEvent interrupt issuing in pre-fetch or write posting mode 0 TerminalCountEvent interrupt is masked 1 TerminalCountEvent interrupt is not masked
0	FIFOEVENTENABLE	0 1	Enables the FIFOEvent interrupt 0 FIFOEvent interrupt is masked 1 FIFOEvent interrupt is not masked

### 7.1.5.6 GPMC\_TIMEOUT\_CONTROL

The GPMC\_TIMEOUT\_CONTROL register allows the user to set the start value of the timeout counter

**Figure 7-56. GPMC\_TIMEOUT\_CONTROL**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-60. GPMC\_TIMEOUT\_CONTROL Field Descriptions**

Bit	Field	Value	Description
31-13	Reserved	0	Reserved
12-4	TIMEOUTSTARTVALUE	0-1FFh	Start value of the time-out counter (000 corresponds to 0 GPMC.FCLK cycle, 1h corresponds to 1 GPMC.FCLK cycle, and 1FFh corresponds to 511 GPMC.FCLK cycles)
3-1	Reserved	0	Reserved
0	TIMEOUTENABLE	0 1	Enable bit of the TimeOut feature TimeOut feature is disabled TimeOut feature is enabled

### 7.1.5.7 GPMC\_ERR\_ADDRESS

The GPMC\_ERR\_ADDRESS register stores the address of the illegal access when an error occurs.

**Figure 7-57. GPMC\_ERR\_ADDRESS**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

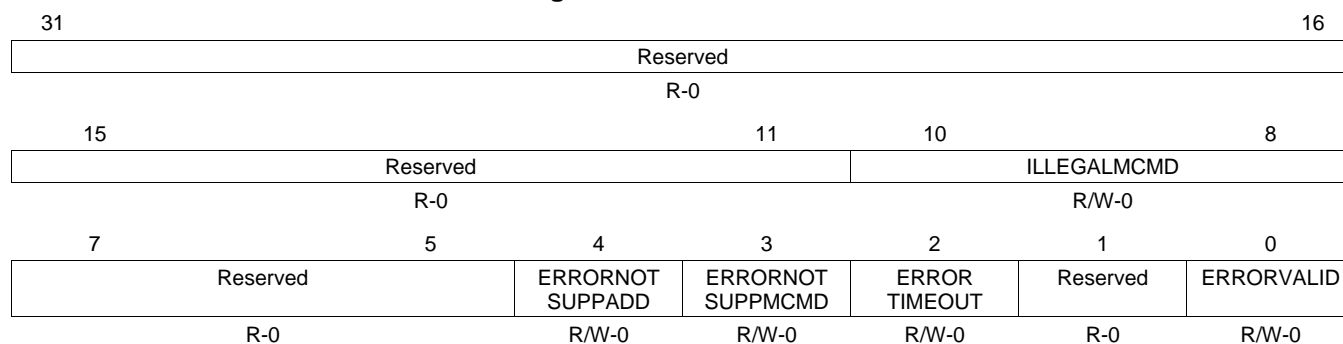

**Table 7-61. GPMC\_ERR\_ADDRESS Field Descriptions**

Bit	Field	Value	Description
31	Reserved	0	Reserved
30-0	ILLEGALADD	0-7FFF FFFFh	Address of illegal access: A30 (0 for memory region, 1 for GPMC register region) and A29-A0 (1GByte maximum)

### 7.1.5.8 GPMC\_ERR\_TYPE

The GPMC\_ERR\_TYPE register stores the type of error when an error occurs.

**Figure 7-58. GPMC\_ERR\_TYPE**

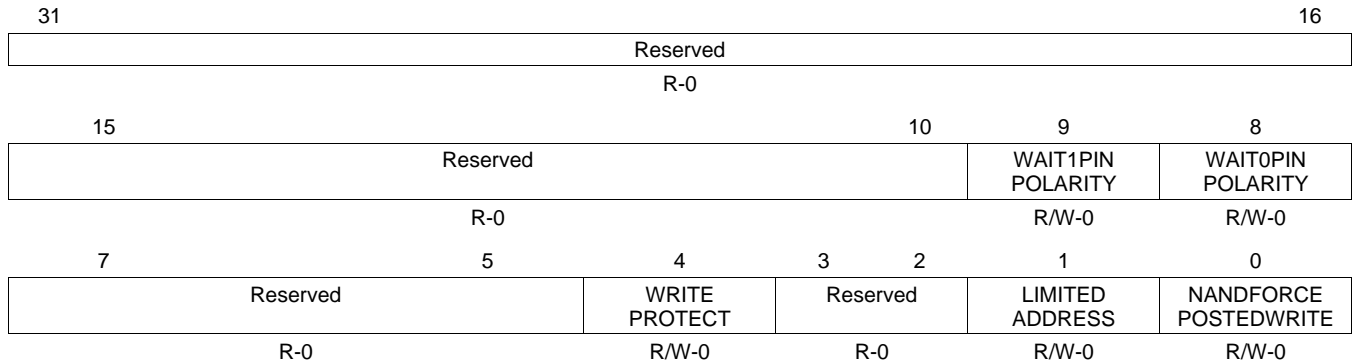

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-62. GPMC\_ERR\_TYPE Field Descriptions**

Bit	Field	Value	Description
31-11	Reserved	0	Reserved
10-8	ILLEGALMCMD	0-7h	System Command of the transaction that caused the error
7-5	Reserved	0	Reserved
4	ERRORNOTSUPPADD	0 1	Not supported Address error No error occurs The error is due to a non supported Address
3	ERRORNOTSUPPMCMD	0 1	Not supported Command error No error occurs The error is due to a non supported Command
2	ERRORTIMEOUT	0 1	Time-out error No error occurs The error is due to a time out
1	Reserved	0	Reserved
0	ERRORVALID	0 1	Error validity status - Must be explicitly cleared with a write 1 transaction All error fields no longer valid Error detected and logged in the other error fields

**7.1.5.9 GPMC\_CONFIG**

The configuration register allows global configuration of the GPMC.

**Figure 7-59. GPMC\_CONFIG**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

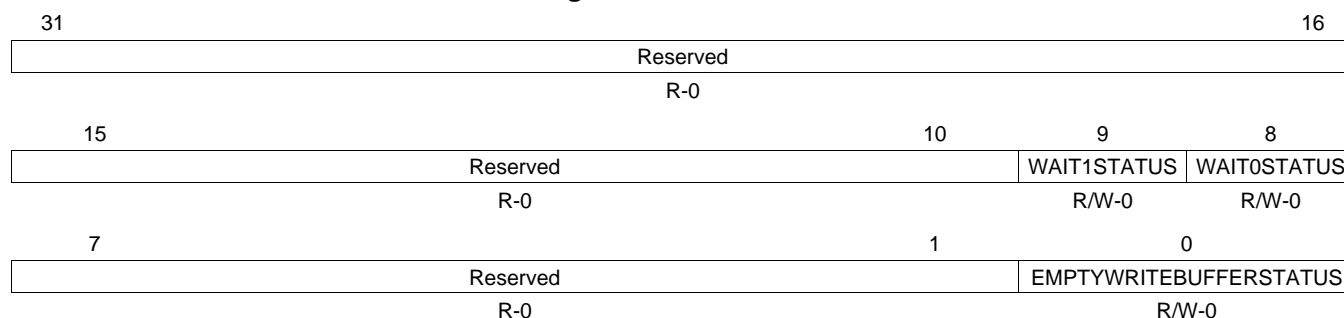

**Table 7-63. GPMC\_CONFIG Field Descriptions**

Bit	Field	Value	Description
31-10	Reserved	0	Reserved
9	WAIT1PINPOLARITY	0 1	Selects the polarity of input pin WAIT1 0 WAIT1 active low 1 WAIT1 active high
8	WAIT0PINPOLARITY	0 1	Selects the polarity of input pin WAIT0 0 WAIT0 active low 1 WAIT0 active high
7-5	Reserved	0	Reserved
4	WRITEPROTECT	0 1	Controls the $\overline{WP}$ output pin level 0 $\overline{WP}$ output pin is low 1 $\overline{WP}$ output pin is high
3-2	Reserved	0	Reserved
1	LIMITEDADDRESS	0 1	Limited Address device support 0 No effect. GPMC controls all addresses. 1 A26-A11 are not modified during an external memory access.
0	NANDFORCEPOSTEDWRITE	0 1	Enables the Force Posted Write feature to NAND Cmd/Add/Data location 0 Disables Force Posted Write 1 Enables Force Posted Write

### 7.1.5.10 GPMC\_STATUS

The status register provides global status bits of the GPMC.

**Figure 7-60. GPMC\_STATUS**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-64. GPMC\_STATUS Field Descriptions**

Bit	Field	Value	Description
31-10	Reserved	0	Reserved
9	WAIT1STATUS	0	Is a copy of input pin WAIT1. (Reset value is WAIT1 input pin sampled at IC reset)
		0	WAIT1 asserted (inactive state)
		1	WAIT1 de-asserted
8	WAIT0STATUS	0	Is a copy of input pin WAIT0. (Reset value is WAIT0 input pin sampled at IC reset)
		0	WAIT0 asserted (inactive state)
		1	WAIT0 de-asserted
7-1	Reserved	0	Reserved
0	EMPTYWRITEBUFFERSTATUS	0	Stores the empty status of the write buffer
		0	Write Buffer is not empty
		1	Write Buffer is empty

### 7.1.5.11 GPMC\_CONFIG1\_i

The configuration 1 register sets signal control parameters per chip select.

**Figure 7-61. GPMC\_CONFIG1\_i**

31	30	29	28	27	26	25	24

15-12	Reserved	0	Reserved
11-8	CYCLE2CYCLEDELAY	0 1h ⋮ Fh	Chip select high pulse delay between two successive accesses 0 GPMC_FCLK cycle 1 GPMC_FCLK cycle ⋮ 15 GPMC_FCLK cycles
7	CYCLE2CYCLESAMECSEN	0 1	Add Cycle2CycleDelay between two successive accesses to the same chip-select (any access type) 0 No delay between the two accesses 1 Add CYCLE2CYCLEDELAY
6	CYCLE2CYCLEDIFFCSEN	0 1	Add Cycle2CycleDelay between two successive accesses to a different chip-select (any access type) 0 No delay between the two accesses 1 Add CYCLE2CYCLEDELAY
5-4	Reserved	0	Reserved
3-0	BUSTURNAROUND	0 1h ⋮ Fh	Bus turn around latency between two successive accesses to the same chip-select (read to write) or to a different chip-select (read to read and read to write) 0 GPMC_FCLK cycle 1 GPMC_FCLK cycle ⋮ 15 GPMC_FCLK cycles

### 7.1.5.17 GPMC\_CONFIG7\_i

Chip-select address mapping configuration.

**Figure 7-67. GPMC\_CONFIG7\_i**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-71. GPMC\_CONFIG7\_i Field Descriptions**

Bit	Field	Value	Description
31-12	Reserved	0	Reserved
11-8	MASKADDRESS	0 8h Ch Eh Fh	Chip-select mask address. Values not listed must be avoided as they create holes in the chip-select address space. Chip-select size of 256 Mbytes Chip-select size of 128 Mbytes Chip-select size of 64 Mbytes Chip-select size of 32 Mbytes Chip-select size of 16 Mbytes
7	Reserved	0	Reserved
6	CSVALID	0 1	Chip-select enable (reset value is 1 for $\overline{CS}[0]$ and 0 for $\overline{CS}[1-5]$ ). $\overline{CS}$ disabled $\overline{CS}$ enabled
5-0	BASEADDRESS	0-3Fh	Chip-select base address. CSi base address where i = 0 to 3 (16 Mbytes minimum granularity). Bits [5-0] corresponds to A29, A28, A27, A26, A25, and A24.

### 7.1.5.18 GPMC\_NAND\_COMMAND\_i

This register is not a true register, just an address location.

**Figure 7-68. GPMC\_NAND\_COMMAND\_i**

LEGEND: W = Write only; -n = value after reset

**Table 7-72. GPMC\_NAND\_COMMAND\_i Field Descriptions**

Bit	Field	Value	Description
31-0	GPMC_NAND_COMMAND_i	0-FFFF FFFFh	Writing data at the GPMC_NAND_COMMAND_i location places the data as the NAND command value on the bus, using a regular asynchronous write access.

### 7.1.5.19 GPMC\_NAND\_ADDRESS\_i

This register is not a true register, just an address location.

**Figure 7-69. GPMC\_NAND\_ADDRESS\_i**

LEGEND: W = Write only; -n = value after reset

**Table 7-73. GPMC\_NAND\_ADDRESS\_i Field Descriptions**

Bit	Field	Value	Description
31-0	GPMC_NAND_ADDRESS_i	0-FFFF FFFFh	Writing data at the GPMC_NAND_ADDRESS_i location places the data as the NAND partial address value on the bus, using a regular asynchronous write access.

### 7.1.5.20 GPMC\_NAND\_DATA\_i

This register is not a true register, just an address location.

**Figure 7-70. GPMC\_NAND\_DATA\_i**

LEGEND: R/W = Read/Write; R = Read only; W = Write only; -n = value after reset

**Table 7-74. GPMC\_NAND\_DATA\_i Field Descriptions**

Bit	Field	Value	Description
31-0	GPMC_NAND_DATA_i	0-FFFF FFFFh	Reading data from the GPMC_NAND_DATA_i location or from any location in the associated chip-select memory region activates an asynchronous read access.

### 7.1.5.21 GPMC\_PREFETCH\_CONFIG1

**Table 7-75. GPMC\_PREFETCH\_CONFIG1 Field Descriptions**

Bit	Field	Value	Description
31	Reserved	0	Reserved
30-28	CYCLEOPTIMIZATION	0 1h : 7h	Define the number of GPMC.FCLK cycles to be subtracted from RdCycleTime, WrCycleTime, AccessTime, CSRdOffTime, CSWrOffTime, ADVRdOffTime, ADVWrOffTime, OEOffTime, WEOffTime 0 GPMC_FCLK cycle 1 GPMC_FCLK cycle : 7 GPMC_FCLK cycles
27	ENABLEOPTIMIZEDACCESS	0 1	Enables access cycle optimization 0 Access cycle optimization is disabled 1 Access cycle optimization is enabled
26-24	ENGINECSSELECTOR	0 1h 2h 3h 4h 5h 6h 7h	Selects the $\overline{CS}$ where Prefetch Postwrite engine is active $\overline{CS0}$ $\overline{CS1}$ $\overline{CS2}$ $\overline{CS3}$ $\overline{CS4}$ $\overline{CS5}$ $\overline{CS6}$ $\overline{CS7}$
23	PFPWENROUNDROBIN	0 1	Enables the PFPW RoundRobin arbitration 0 Prefetch Postwrite engine round robin arbitration is disabled 1 Prefetch Postwrite engine round robin arbitration is enabled
22-20	Reserved	0	Reserved
19-16	PFPWWEIGHTEDPRIO	0 1h : Fh	When an arbitration occurs between a direct memory access and a PFPW engine access, the direct memory access is always serviced. If the PFPWEnRoundRobin is enabled, 0 The next access is granted to the PFPW engine 1h The two next accesses are granted to the PFPW engine : Fh The 16 next accesses are granted to the PFPW engine
15	Reserved	0	Reserved

**Table 7-75. GPMC\_PREFETCH\_CONFIG1 Field Descriptions (continued)**

Bit	Field	Value	Description
14-8	FIFOTHRESHOLD	0 1h ⋮ 40h	Selects the maximum number of bytes read from the FIFO or written to the FIFO by the host on a DMA or interrupt request 0 byte 1 byte ⋮ 64 bytes
7	ENABLEENGINE	0 1	Enables the Prefetch Postwrite engine Prefetch Postwrite engine is disabled Prefetch Postwrite engine is enabled
6	Reserved	0	Reserved
5-4	WAITPINSELECTOR	0 1h 2h 3h	Select which WAIT pin edge detector should start the engine in synchronized mode Selects Wait0EdgeDetection Selects Wait1EdgeDetection Reserved Reserved
3	SYNCHROMODE	0 1	Selects when the engine starts the access to CS Engine starts the access to CS as soon as STARTENGINE is set Engine starts the access to CS as soon as STARTENGINE is set AND wait to non wait edge detection on the selected wait pin
2	DMAMODE	0 1	Selects interrupt synchronization or DMA request synchronization Interrupt synchronization is enabled. Only interrupt line will be activated on FIFO threshold crossing. DMA request synchronization is enabled. A DMA request protocol is used.
1	Reserved	0	Reserved
0	ACCESSMODE	0 1	Selects pre-fetch read or write posting accesses Prefetch read mode Write-posting mode

### 7.1.5.22 GPMC\_PREFETCH\_CONFIG2

**Figure 7-72. GPMC\_PREFETCH\_CONFIG2**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-76. GPMC\_PREFETCH\_CONFIG2 Field Descriptions**

Bit	Field	Value	Description
31-14	Reserved	0	Reserved
13-0	TRANSFERCOUNT	0 1h ⋮ 2000h	Selects the number of bytes to be read or written by the engine to the selected CS 0 byte 1 byte ⋮ 8 Kbytes

### 7.1.5.23 GPMC\_PREFETCH\_CONTROL

**Figure 7-73. GPMC\_PREFETCH\_CONTROL**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-77. GPMC\_PREFETCH\_CONTROL Field Descriptions**

Bit	Field	Value	Description
31-1	Reserved	0	Reserved
0	STARTENGINE	R0 W0 R1 W1	Resets the FIFO pointer and starts the engine Engine is stopped Stops the engine Engine is running Resets the FIFO pointer to 0 in prefetch mode and 40h in postwrite mode and starts the engine

**7.1.5.24 GPMC\_PREFETCH\_STATUS**
**Figure 7-74. GPMC\_PREFETCH\_STATUS**

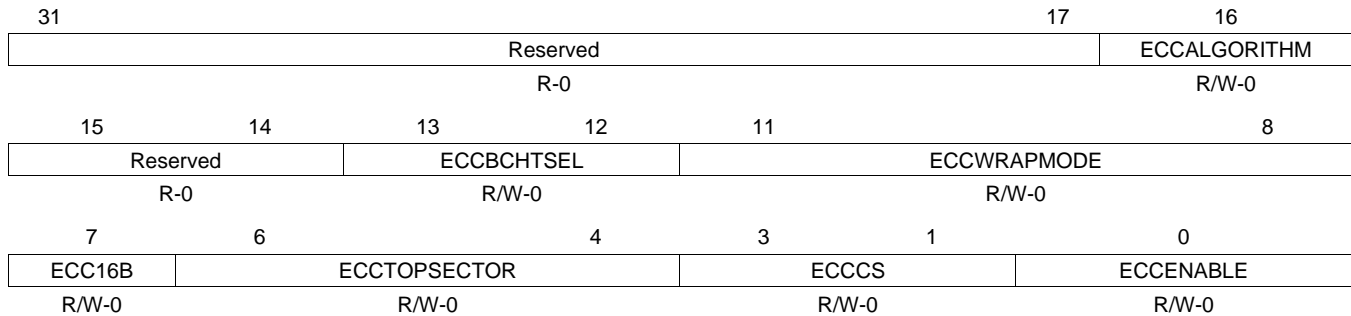

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-78. GPMC\_PREFETCH\_STATUS Field Descriptions**

Bit	Field	Value	Description
31	Reserved	0	Reserved
30-24	FIFOPOINTER	0 ⋮ 40h	0 byte available to be read or 0 free empty place to be written ⋮ 64 bytes available to be read or 64 empty places to be written
23-17	Reserved	0	Reserved
16	FIFOTHRESHOLDSTATUS	0 1	Set when FIFOPointer exceeds FIFOThreshold value 0 FIFOPointer smaller or equal to FIFOThreshold. Writing to this bit has no effect 1 FIFOPointer greater than FIFOThreshold. Writing to this bit has no effect
15-14	Reserved	0	Reserved
13-0	COUNTVALUE	0 1h ⋮ 2000h	Number of remaining bytes to be read or to be written by the engine according to the TransferCount value 0 0 byte remaining to be read or to be written 1h 1 byte remaining to be read or to be writte ⋮ 8 Kbytes remaining to be read or to be written

### 7.1.5.25 GPMC\_ECC\_CONFIG

**Figure 7-75. GPMC\_ECC\_CONFIG**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-79. GPMC\_ECC\_CONFIG Field Descriptions**

Bit	Field	Value	Description
31-17	Reserved	0	Reserved
16	ECCALGORITHM	0	ECC algorithm used
		1	BCH code
15-14	Reserved	0	Reserved
13-12	ECCBCHTSEL	0	Error correction capability used for BCH
		1h	Up to 4 bits error correction (t = 4)
		2h	Up to 8 bits error correction (t = 8)
		3h	Up to 16 bits error correction (t = 16)
11-8	ECCWRAPMODE	0-Fh	Spare area organization definition for the BCH algorithm. See the BCH syndrome/parity calculator module functional specification for more details
7	ECC16B	0	Selects an ECC calculated on 16 columns
		1	ECC calculated on 8 columns
6-4	ECCTOPSECTOR	0	1 sector (512kB page)
		1h	2 sectors
		3h	4 sectors (2kB page)
		:	:
		7h	8 sectors (4kB page)
3-1	ECCCS	0	Selects the Chip-select where ECC is computed
		1h	Chip-select 0
		2h	Chip-select 1
		3h	Chip-select 2
		4h	Chip-select 3
		5h	Chip-select 4
		6h-7h	Chip-select 5
0	ECCENABLE	0	Reserves
		1	Enables the ECC feature
		0	ECC disabled
		1	ECC enabled

**7.1.5.26 GPMC\_ECC\_CONTROL**
**Figure 7-76. GPMC\_ECC\_CONTROL**

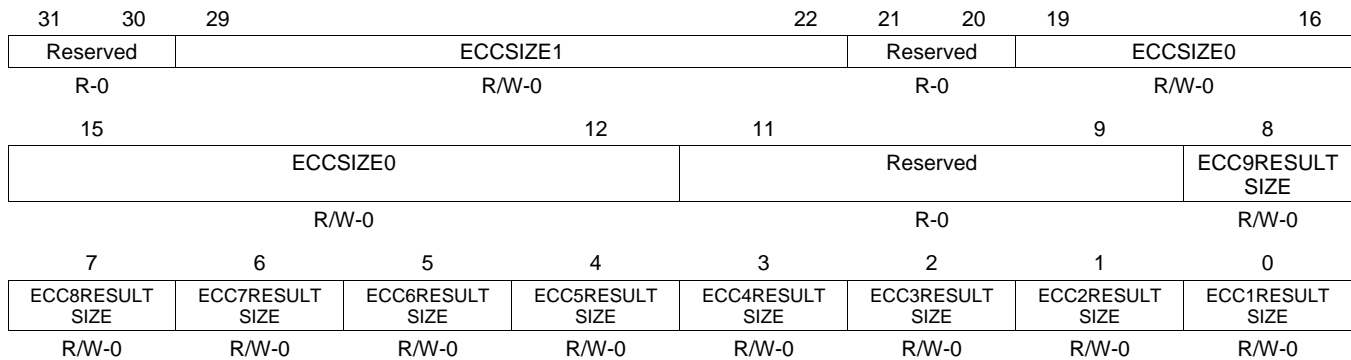

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-80. GPMC\_ECC\_CONTROL Field Descriptions**

Bit	Field	Value	Description
31-9	Reserved	0	Reserved
8	ECCCLEAR	R0 W0 W1	Clear all ECC result registers All reads return 0 Ignored Clears all ECC result registers
7-4	Reserved	0	Reserved
3-0	ECCPOINTER	0-Fh  0 1h 2h 3h 4h 5h 6h 7h 8h 9h	Selects ECC result register (Reads to this field give the dynamic position of the ECC pointer - Writes to this field select the ECC result register where the first ECC computation will be stored). Writing values not listed disables the ECC engine (ECCEnable bit of GPMC_ECC_CONFIG cleared to 0).  Writing 0 disables the ECC engine (ECCENABLE bit of GPMC_ECC_CONFIG cleared to 0) ECC result register 1 selected ECC result register 2 selected ECC result register 3 selected ECC result register 4 selected ECC result register 5 selected ECC result register 6 selected ECC result register 7 selected ECC result register 8 selected ECC result register 9 selected

### 7.1.5.27 GPMC\_ECC\_SIZE\_CONFIG

**Figure 7-77. GPMC\_ECC\_SIZE\_CONFIG**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-81. GPMC\_ECC\_SIZE\_CONFIG Field Descriptions**

Bit	Field	Value	Description
31-30	Reserved	0	Reserved
29-22	ECCSIZE1	0 1h 2h 3h : FFh	Defines ECC size 1 2 Bytes 4 Bytes 6 Bytes 8 Bytes : 512 Bytes
21-20	Reserved	0	Reserved
19-12	ECCSIZE0	0 1h 2h 3h : FFh	Defines ECC size 0 2 Bytes 4 Bytes 6 Bytes 8 Bytes : 512 Bytes
11-9	Reserved	0	Reserved
8	ECC9RESULTSIZ	0 1	Selects ECC size for ECC 9 result register ECCSIZE0 selected ECCSIZE1 selected
7	ECC8RESULTSIZ	0 1	Selects ECC size for ECC 8 result register ECCSIZE0 selected ECCSIZE1 selected
6	ECC7RESULTSIZ	0 1	Selects ECC size for ECC 7 result register ECCSIZE0 selected ECCSIZE1 selected
5	ECC6RESULTSIZ	0 1	Selects ECC size for ECC 6 result register ECCSIZE0 selected ECCSIZE1 selected
4	ECC5RESULTSIZ	0 1	Selects ECC size for ECC 5 result register ECCSIZE0 selected ECCSIZE1 selected

**Table 7-81. GPMC\_ECC\_SIZE\_CONFIG Field Descriptions (continued)**

Bit	Field	Value	Description
3	ECC4RESULTSIZ	0	Selects ECC size for ECC 4 result register ECCSIZE0 selected
		1	ECCSIZE1 selected
2	ECC3RESULTSIZ	0	Selects ECC size for ECC 3 result register ECCSIZE0 selected
		1	ECCSIZE1 selected
1	ECC2RESULTSIZ	0	Selects ECC size for ECC 2 result register ECCSIZE0 selected
		1	ECCSIZE1 selected
0	ECC1RESULTSIZ	0	Selects ECC size for ECC 1 result register ECCSIZE0 selected
		1	ECCSIZE1 selected

### 7.1.5.29 GPMC\_BCH\_RESULT0\_i

**Figure 7-79. GPMC\_BCH\_RESULT0\_i**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-83. GPMC\_BCH\_RESULT0\_i Field Descriptions**

Bit	Field	Value	Description
31-0	BCH_RESULT0_i	0-FFFF FFFFh	BCH ECC result, bits 0 to 31

### 7.1.5.30 GPMC\_BCH\_RESULT1\_i

**Figure 7-80. GPMC\_BCH\_RESULT1\_i**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-84. GPMC\_BCH\_RESULT1\_i Field Descriptions**

Bit	Field	Value	Description
31-0	BCH_RESULT1_i	0-FFFF FFFFh	BCH ECC result, bits 32 to 63

### 7.1.5.31 GPMC\_BCH\_RESULT2\_i

**Figure 7-81. GPMC\_BCH\_RESULT2\_i**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-85. GPMC\_BCH\_RESULT2\_i Field Descriptions**

Bit	Field	Value	Description
31-0	BCH_RESULT2_i	0-FFFF FFFFh	BCH ECC result, bits 64 to 95

### 7.1.5.32 GPMC\_BCH\_RESULT3\_i

**Figure 7-82. GPMC\_BCH\_RESULT3\_i**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-86. GPMC\_BCH\_RESULT3\_i Field Descriptions**

Bit	Field	Value	Description
31-0	BCH_RESULT3_i	0-FFFF FFFFh	BCH ECC result, bits 96 to 127

### 7.1.5.33 GPMC\_BCH\_SWDATA

This register is used to directly pass data to the BCH ECC calculator without accessing the actual NAND flash interface.

**Figure 7-83. GPMC\_BCH\_SWDATA**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-87. GPMC\_BCH\_SWDATA Field Descriptions**

Bit	Field	Value	Description
31-16	Reserved	0	Reserved
15-0	BCH_DATA	0-FFFFh	Data to be included in the BCH calculation. Only bits 0 to 7 are taken into account, if the calculator is configured to use 8 bits data (GPMC_ECC_CONFIG[7] ECC16B = 0).

### 7.1.5.34 GPMC\_BCH\_RESULT4\_i

**Figure 7-84. GPMC\_BCH\_RESULT4\_i**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-88. GPMC\_BCH\_RESULT4\_i Field Descriptions**

Bit	Field	Value	Description
31-0	BCH_RESULT4_i	0-FFFF FFFFh	BCH ECC result, bits 128 to 159

**7.1.5.35 GPMC\_BCH\_RESULT5\_i**
**Figure 7-85. GPMC\_BCH\_RESULT5\_i**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-89. GPMC\_BCH\_RESULT5\_i Field Descriptions**

Bit	Field	Value	Description
31-0	BCH_RESULT5_i	0-FFFF FFFFh	BCH ECC result, bits 160 to 191

**7.1.5.36 GPMC\_BCH\_RESULT6\_i**
**Figure 7-86. GPMC\_BCH\_RESULT6\_i**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-90. GPMC\_BCH\_RESULT6\_i Field Descriptions**

Bit	Field	Value	Description
31-0	BCH_RESULT6_i	0-FFFF FFFFh	BCH ECC result, bits 192 to 207

## 7.2 OCMC-RAM

### 7.2.1 Introduction

#### 7.2.1.1 OCMC-RAM Features

The on-chip memory controller consists of two separate modules that are OCP to memory wrappers. The first wrapper is for a ROM; the second is for a RAM. Each wrapper has its own dedicated interface to the L3 interconnect.

- 32- or 64-bit width
- Initial latency max 2 cycles (due to OCP to memory core wrapper).
- Multiple memory bank control based on address MSBs
- Full OCP IP 2.0 Burst support. No wait state.

#### 7.2.1.2 Unsupported OCMC-RAM Features

For this device, the OCMC-RAM implementation does not support parity.

### 7.2.2 Integration

This device includes a single instantiation of the on-chip memory controller interfacing to a single 64K bank of RAM.

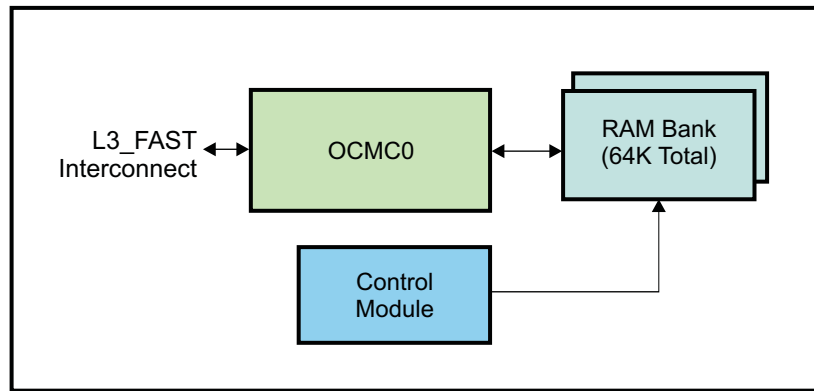

Figure 7-87. OCMC RAM Integration

#### 7.2.2.1 OCMC RAM Connectivity Attributes

The general connectivity attributes for the OCMC RAM modules are summarized in [Table 7-91](#).

Table 7-91. OCMC RAM Connectivity Attributes

Attributes	Type
Power Domain	Peripheral Domain
Clock Domain	PD_PER_L3_GCLK
Reset Signals	PER_DOM_RST_N
Idle/Wakeup Signals	Smart Idle
Interrupt Requests	None
DMA Requests	None
Physical Address	L3 Fast slave port

#### 7.2.2.2 OCMC RAM Clock and Reset Management

The OCMC module uses a single clock for the module and its OCP interface.

Table 7-92. OCMC RAM Clock Signals

Clock Signal	Max Freq	Reference / Source	Comments
prcm_ocmc_clock Interface / Functional clock	200 MHz	CORE_CLKOUTM4	pd_per_l3_gclk From PRCM

#### 7.2.2.3 OCMC RAM Pin List

The OCMC RAM module does not include any external interface pins.

## 7.3 EMIF

### 7.3.1 Introduction

#### 7.3.1.1 Features

The general features of the EMIF module are as follows:

- 16-bit data path to external SDRAM memory
- One 128-bit OCPIP 2.2 interface
- Support for the following memory types:
  - mDDR (LPDDR1)
  - DDR2
  - DDR3

#### External memory configurations supported:

- Memory device capacity
  - Up to 1G Byte addressability
- Flexible bank/row/column/chip-select address multiplexing schemes
- Device driver strength feature for mobile DDR supported
- Supports following CAS latencies:
  - DDR2 => 2, 3, 4, 5, 6, and 7
  - DDR3 => 5, 6, 7, 8, 9, 10, and 11
  - mDDR => 2, 3, and 4
- Supports following number of internal banks:
  - DDR2 => 1, 2, 4, and 8
  - DDR3 => 1, 2, 4, and 8
  - mDDR => 1, 2, and 4
- Supports 256, 512, 1024, and 2048-word page sizes
- Supports burst length of 8 (sequential burst)
- Write/read leveling/calibration and data eye training in conjunction with DID
- Self Refresh and Power-Down modes for low power:
  - Flexible OCP to DDR address mapping to support Partial Array Self Refresh in LPDDR1, DDR2 and DDR3.
  - Temperature Controlled Self Refresh for LPDDR1 and DDR3 having on-chip temperature sensor.
- Periodic ZQ calibration for DDR3
- ODT on DDR2 and DDR3
- Prioritized refresh scheduling
- Programmable SDRAM refresh rate and backlog counter
- Programmable SDRAM timing parameters
- Big and little endian modes

### 7.3.1.2 Unsupported EMIF Features

The following EMIF4DC module features are not supported in this device.

**Table 7-93. Unsupported EMIF Features**

Feature	Reason
32-bit data	Only 16 bits pinned out
Multiple DDR banks	Only 1 CS/ODT pinned out
DDR2 CAS Latency 2	Not supported by DID
Hardware leveling	Silicon bug. Must use software leveling procedure. See <i>AM335x ARM Cortex-A8 Microprocessors (MPUs) Silicon Errata</i> (literature number <a href="#">SPRZ360</a> ).

## 7.3.2 Integration

### 7.3.2.1 EMIF Connectivity Attributes

The general connectivity attributes for the EMIF are shown in [Table 7-94](#).

**Table 7-94. EMIF Connectivity Attributes**

Attributes	Type
Power Domain	Peripheral Domain
Clock Domain	PD_PER_L3_GCLK (OCP) PD_PER_EMIF_GCLK (Func)
Reset Signals	POR_N
Idle/Wakeup Signals	Smart Idle
Interrupt Requests	1 interrupt to MPU Subsystem (DDRERR0)
DMA Requests	None
Physical Address	L3 Fast Slave Port

### 7.3.2.2 EMIF Clock Management

The EMIF4 OCP interface (*ocp\_clk*) is clocked by the L3 Fast clock sourced from the Core PLL. The DDR Command and Data macros are clocked by the DDR PLL. The PRCM divides this clock by two to create the EMIF functional clock (*m\_clk*).

The OCP and functional clocks may be asynchronous because synchronization is managed in the EMIF4 internal FIFO (EMIF4 is set in asynchronous mode).

**Table 7-95. EMIF Clock Signals**

Clock Signal	Maximum Frequency	Reference Source	Comments
<i>ocp_clk</i> (Interface clock)	200 MHz	CORE_CLKOUTM4	<i>pd_per_l3_gclk</i> From PRCM
<i>m_clk</i> (EMIF functional clock)	152 MHz	DDR PLL CLKOUT / 2	<i>pd_per_emif_gclk</i> From PRCM
<i>cmd0_dfi_clk</i> <i>cmd1_dfi_clk</i> <i>cmd2_dfi_clk</i> <i>data0_dfi_clk</i> <i>data1_dfi_clk</i> (Macro clocks)	400 MHz	DDR PLL CLKOUT	<i>clkout_po</i> From DDR PLL

### 7.3.2.3 EMIF Pin List

The EMIF/DDR external interface signals are shown in [Table 7-96](#).

**Table 7-96. EMIF Pin List**

Pin	Type	Description
DDR_CK DDR_NCK	O	Differential clock pair
DDR_CKE	O	Clock enable
DDR_CSn0	O	Chip select
DDR_RASn	O	Row address strobe
DDR_CASn	O	Column address strobe
DDR_WEn	O	Write enable
DDR_BA[2:0]	O	Bank address

**Table 7-96. EMIF Pin List (continued)**

<b>Pin</b>	<b>Type</b>	<b>Description</b>
DDR_A[15:0]	O	Row/column address
DDR_DQS[1:0]	I/O	Data strobes
DDR_DQSn[1:0]	I/O	Complimentary data strobes
DDR_DQM[1:0]	O	Data masks
DDR_D[15:0]	I/O	Data
DDR_ODT	O	On-die termination
DDR_RESETh	O	DDR device reset
DDR_VREF	I	I/O Voltage reference
DDR_VTP	I	VTP compensation pin

### 7.3.3 Functional Description

#### 7.3.3.1 Signal Descriptions

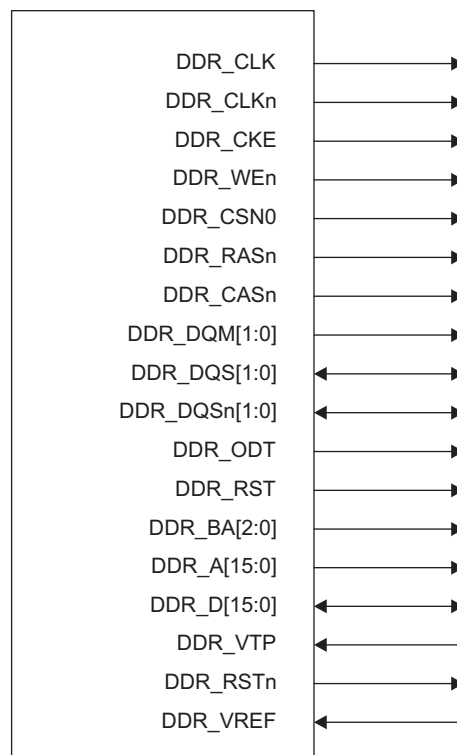

The DDR2/3/mDDR memory controller signals are shown in [Figure 7-88](#) and described in [Table 7-97](#). The following features are included:

- The maximum width for the data bus (DDR\_D[15:0]) is 16-bits
- The address bus (DDR\_A[15:0]) is 16-bits wide with an additional 3 bank address pins (DDR\_BA[2:0])
- Two differential output clocks (DDR\_CLK and DDR\_nCK) driven by internal clock sources
- Command signals: Row and column address strobe (DDR\_RASn and DDR\_CASn), write enable strobe

(DDR\_WEn), data strobe (DDR\_DQS[1:0] and DDR\_DQSn[1:0]), and data mask (DDR\_DQM[1:0]).

- One chip select signal (DDR\_CSN0) and one clock enable signal (DDR\_CKE)
- One on-die termination output signals (DDR\_ODT).

**Figure 7-88. DDR2/3/mDDR Memory Controller Signals**

**Table 7-97. DDR2/3/mDDR Memory Controller Signal Descriptions**

Pin	Description
DDR_D[15:0]	Bidirectional data bus. Input for data reads and output for data writes.
DDR_A[15:0]	External address output.
DDR_CSN0	Chip select output.
DDR_DQM[1:0]	Active-low output data mask.
DDR_CLK/DDR_CLKn	Differential clock outputs. All DDR2/3/mDDR interface signals are synchronous to these clocks.
DDR_CKE	Clock enable. Used to select Power-Down and Self-Refresh operations.
DDR_CASn	Active-low column address strobe.
DDR_RASn	Active-low row address strobe.
DDR_WEn	Active-low write enable.

**Table 7-97. DDR2/3/mDDR Memory Controller Signal Descriptions (continued)**

Pin	Description
DDR_DQS[1:0]/DDR_DQSn[1:0]	Differential data strobe bidirectional signals. Edge-aligned inputs on reads and center-aligned outputs on writes.
DDR_ODT	On-die termination signal to external DDR2/3 SDRAM. ODT is not supported for mDDR.
DDR_BA[2:0]	Bank-address control outputs.
DDR_VREF	Memory Controller reference voltage. This voltage must be supplied externally. See the device-specific data manual for more details.
DDR_VTP	DDR2/3/mDDR VTP Compensation Resistor Connection.
DDR_RESETh	Reset output. Asynchronous reset for DDR3 devices.

### 7.3.3.2 Clock Control

DDR2/3/mDDR clock is derived directly from the DDR PLL's VCO output. The frequency of DDR\_CLK can be determined by using the following formula:

$$\text{DDR\_CLK frequency} = (\text{DDRPLL input clock frequency} \times \text{multiplier}) / ((\text{pre-divider} + 1) \times \text{post-divider})$$

The second output clock of the DDR2/3/mDDR memory controller DDR\_CLKn, is the inverse of DDR\_CLK. You can change the multiplier, pre-divider and post-divider to get the desired DDR\_CLK frequency.

For detailed information on DDR PLL, see [Section 8.1, Power Management and Clock Module \(PRCM\)](#).

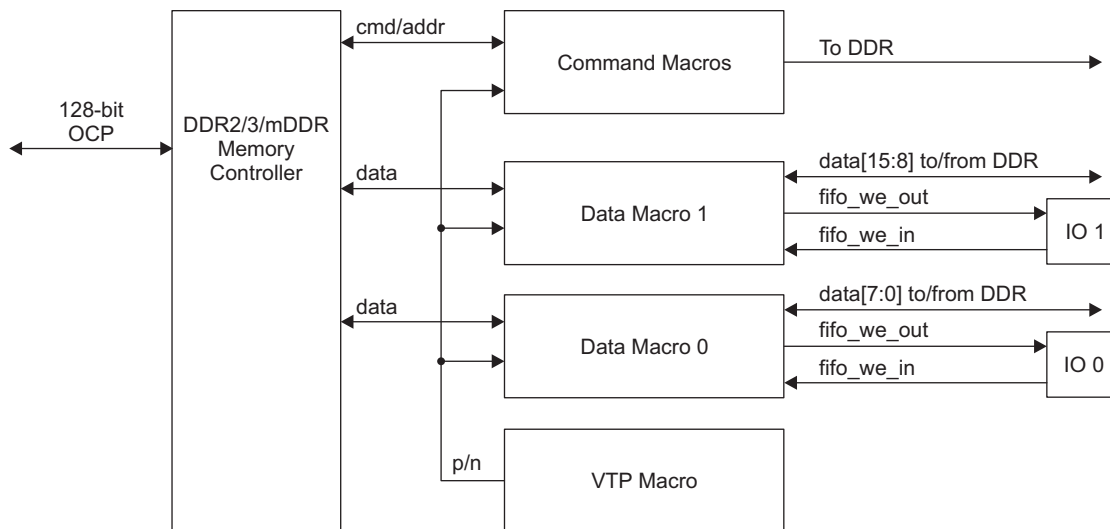

### 7.3.3.3 DDR2/3/mDDR Memory Controller Subsystem Overview

The DDR2/3/mDDR memory controller can gluelessly interface to most standard DDR2/3/mDDR SDRAM devices and supports such features as self-refresh mode and prioritized refresh. In addition, it provides flexibility through programmable parameters such as the refresh rate, CAS latency, and many SDRAM timing parameters. The DDR2/3/mDDR subsystem consists of the following:

- DDR2/3/mDDR memory controller
- Command macro
- Data macro
- VTP controller macro
- IOs for DQS gate

The subsystem supports JEDEC standard compliant DDR2/DDR3 and mDDR(LPDDR1) devices. It does not support CAS latency of 2 for DDR2 due to data and command macro limitations. It supports a 128-bit wide OCP interface on the core side for programmability. The subsystem can be used to connect to 16-bit memory devices.

[Figure 7-89](#) shows the DDR2/3/mDDR subsystem block diagram.

**Figure 7-89. DDR2/3/mDDR Subsystem Block Diagram**

Where

fifo\_we\_out = DQS enable output for timing match between DQS and system (Memory) clock.

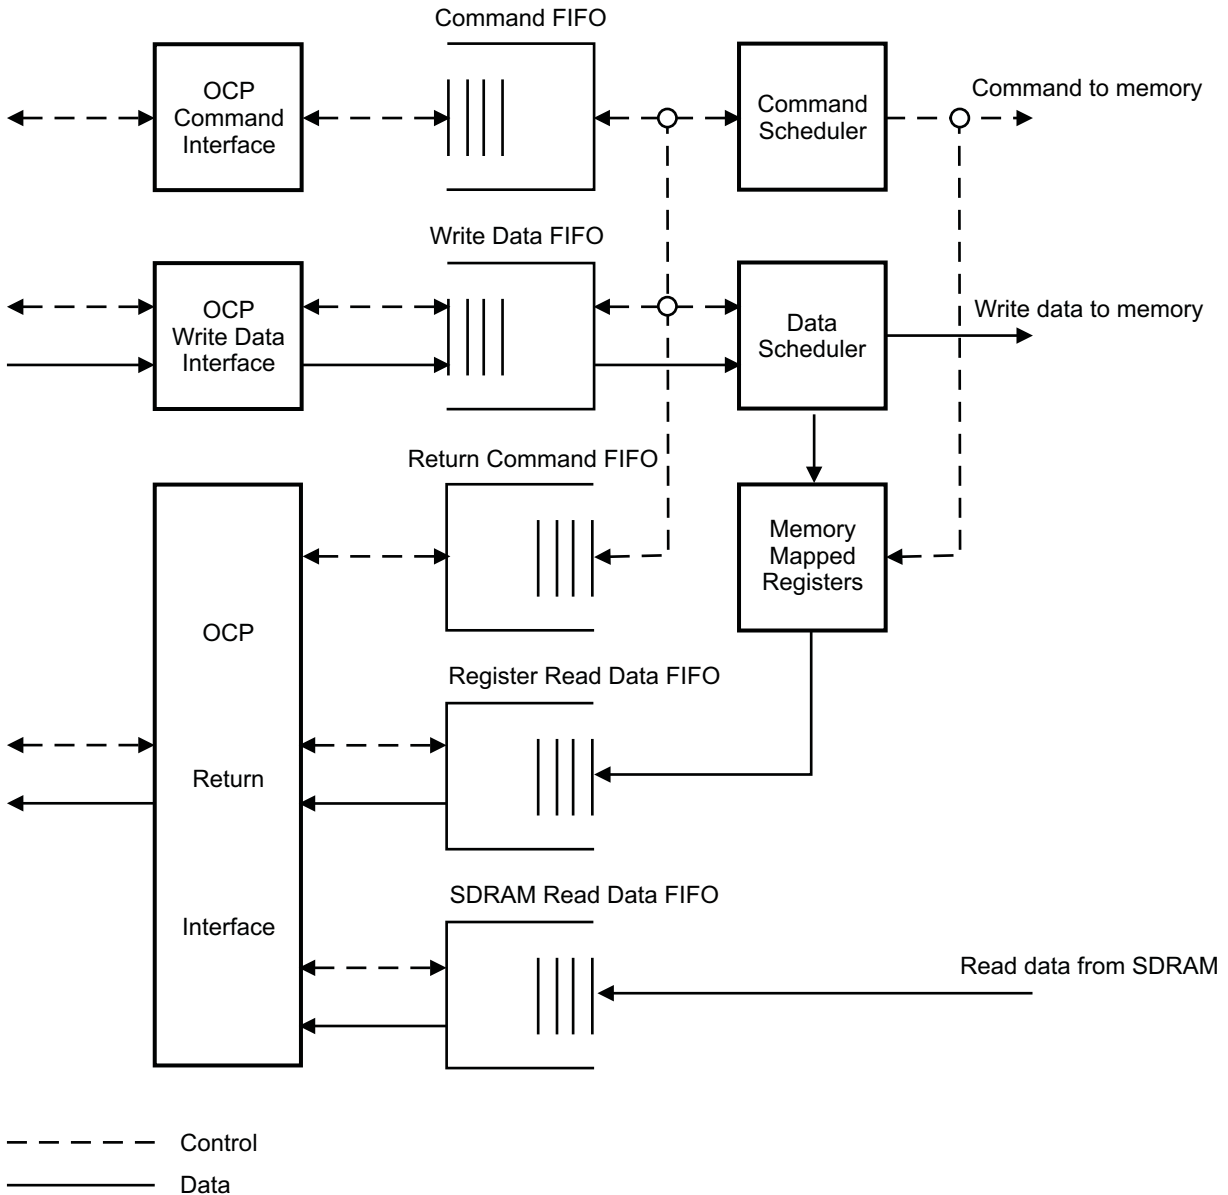

fifo\_we\_in = DQS enable input for timing match between DQS and system (Memory) clock.

### 7.3.3.3.1 DDR2/3/mDDR Memory Controller Interface

To move data efficiently from on-chip resources to external DDR2/3/mDDR SDRAM device, the DDR2/3/mDDR memory controller makes use of a command FIFO, a write data FIFO, a return command FIFO, and two Read Data FIFOs. Purpose of each FIFO is described below.

Figure 7-90 shows the block diagram of the DDR2/3/mDDR memory controller FIFOs. Commands, write data, and read data arrive at the DDR2 memory controller parallel to each other. The same peripheral bus is used to write and read data from external memory as well as internal memory-mapped registers.

Figure 7-90. DDR2/3/mDDR Memory Controller FIFO Block Diagram

The command FIFO stores all the commands coming in on the OCP command interface.

The Write Data FIFO stores the write data for all the write transactions coming in on the OCP write data interface.

The Return Command FIFO stores all the return transactions that are to be issued to the OCP return interface. These include the write status return and the read data return commands.

There are two Read Data FIFOs that store the read data to be sent to the OCP return interface. One Read Data FIFO stores read data from the memory mapped registers and other Read Data FIFO stores read data from external memory.

### 7.3.3.3.2 Data Macro

The data macro consists of 8 data channels, one pair of complementary strobes (one pair for 8 bits of data), and one data mask channel (one for 8 bits of data).

The data macros consists of PHY Data Macro, DLLs and IOs integrated into a macro.

The data macro is a bidirectional interface. It is used to transmit data from the memory controller to the external memory chip during a write operation and receive data from memory and transmit it to the memory controller during a read operation.

During a write operation, the data macro translates 32/16-bit words from memory controller to 8-bit words and transmits them at double the bit rate to the memory along with the strobe. The strobe is center-aligned to the data. Data can be prevented from writing to the memory using data mask signal.

During a read operation, the data macro receives 8-bit DDR data along with the strobe and converts it to 32/16-bit words and transmits them to the memory controller along with the read-valid signals.

### 7.3.3.3 Command Macro

It consists of PHY Command Macro, DLLs and the IOs integrated together. The command macro acts as a unidirectional macro that transmits address and control bits from memory controller to the memory chip. The clocks DDR\_CLK and DDR\_CLKn are used by the memory to register the command and address transmitted on the transmit channels. All address and control signals are transmitted clock-centered with respect to DDR\_CLK and DDR\_CLKn. The memory, on the positive edge of DDR\_CLK and the negative edge of DDR\_CLKn, samples all address and control signals.

### 7.3.3.4 VTP Controller Macro

The VTP controller macro evaluates silicon performance at current voltage, temperature, and process (VTP) to enable IO drivers to set constant predetermined output driver impedance. The controller operates by comparing driver impedances to the external reference resistor and adjusting driver impedance to obtain an impedance match. VTP Controller supports the following features:

- The VTP controller generates information regarding the Voltage, temperature, and process(VTP) on a chip to be shared with the device's IO drivers
- Requires a Clock input from the core running at 20MHz or less
- 56 Clock cycles are needed to guarantee the VTP outputs are initially set after reset is removed
- Can be used in static or dynamic update mode of operation
- The VTP controller has internal noise filtering which allows it to control spurious update requests due to noise

Impedance of the drivers and terminations must be updated often even while in operation. In such scenarios where Voltage and Temperature are variables VTP macro can be configured in dynamic update mode. In contrast, static mode of operation does not allow dynamic calibration of IO impedance, and hence consumes lesser power compared to dynamic update mode.

It is possible that under noisy conditions, dynamic update controller can generate too frequent update requests. Noise can cause the controller to request a change in the impedance that can again be quickly reversed on subsequent clock cycles. To prevent the controller from making excessive numbers of impedance changes, a digital filter is included which can be configured to regulate the update rate. For example if the user configures the filter value as F2=0,F1=1 and F0=1, then an impedance update will be performed only if four successive update requests are generated from the VTP controller. It is recommended to use a filter value of 011'b.

Table 7-98 shows the configuration details of the digital filter.

**Table 7-98. Digital Filter Configuration**

F2	F1	F0	Description
0	0	0	Off
0	0	1	Update on 2 consecutive update requests
0	1	0	Update on 3 consecutive update requests
0	1	1	Update on 4 consecutive update requests
1	0	0	Update on 5 consecutive update requests
1	0	1	Update on 6 consecutive update requests
1	1	0	Update on 7 consecutive update requests

**Table 7-98. Digital Filter Configuration (continued)**

F2	F1	F0	Description
1	1	1	Update on 8 consecutive update requests

### 7.3.3.3.5 DQS-Gate IOs

To effectively model the I/O delay on the DQS gating signal during a read request (the DQS receiver and the CLK driver I/Os), the signal is expected to be looped on a single I/O connecting `fifo_we_in` to `fifo_we_out`. The board and memory delay, being fairly constant across PTV variations, are calibrated within the IDID using a compensated delay line. The loop-back is done at the die level without bringing the signals out to the package level. Each Data Macro supports delay compensation independent of each other.

The data and command macros are responsible for System level flight time compensation. The following controls are supported by the DDR2/3/mDDR controller Sub System.

- Aligning DDR\_DQS w.r.t DDR\_CLK during Write Cycle: For DDR3 operation, initiate the write leveling state machine on each rank in turn to capture the proper delay settings to align DDR\_DQS with DDR\_CLK clock for each memory chip. If one wants to do this in a manual way one can write to the control register that controls the delay of DDR\_DQS vs DDR\_CLK Clock position. To produce a given amount of skew to center the DDR\_DQS vs. Clock at the SDRAM the following register can be programmed.

Data Macro 0/1 Write DQS Slave Ratio Register =  $256 \times (([\text{command delay}] - [\text{DDR\_DQS delay}]) / \text{DDR\_CLK Clock period})$ .

- Aligning ADDR/CMD w.r.t DDR\_CLK
- Aligning DDR\_DQ[15:0] w.r.t DDR\_DQS during Write Operation
- Offset DDR\_D[15:0] w.r.t DDR\_DQS during Read Operation
- Align FIFO WE Window

### 7.3.3.4 Address Mapping

The DDR2/3/mDDR memory controller views external DDR2/3/mDDR SDRAM as one continuous block of memory. This statement is true regardless of the number of memory devices located on the chip select space. The DDR2/3/mDDR memory controller receives DDR2/3/mDDR memory access requests along with a 32-bit logical address from the rest of the system. In turn, DDR2/3/mDDR memory controller uses the logical address to generate a row/page, column, and bank address for the DDR2/3/mDDR SDRAM. The number of column, row and bank address bits used is determined by the IBANK, RSIZE and PAGESIZE fields (see [Table 7-99](#)). The DDR2/3/mDDR memory controller uses up to 16 bits for the row/page address.

**Table 7-99. IBANK, RSIZE and PAGESIZE Fields Information**

Bit Field	Bit Value	Bit Description
RSIZE		Defines the number of address lines to be connected to DDR2/3/mDDR memory device
	0	9 row bits
	1h	10 row bits
	2h	11 row bits
	3h	12 row bits
	4h	13 row bits
	5h	14 row bits
	6h	15 row bits
	7h	16 row bits

**Table 7-99. IBANK, RSIZE and PAGESIZE Fields Information (continued)**

Bit Field	Bit Value	Bit Description
PAGESIZE		Defines the page size of each page of the external DDR2/3/mDDR memory device
	0	256 words (requires 8 column address bits)
	1h	512 words (requires 9 column address bits)
	2h	1024 words (requires 10 column address bits)
	3h	2048 words (requires 11 column address bits)
IBANK		Defines the number of internal banks on the external DDR2/3/mDDR memory device
	0	1 bank
	1h	2 banks
	2h	4 banks
	3h	8 banks
EBANK		Defines the number of DDR2/3/mDDR memory controller chip selects
	0	CS0 only
	1h	Reserved

When addressing SDRAM, if the REG\_IBANK\_POS field in the SDRAM Config register is set to 0, and the REG\_EBANK\_POS field in the SDRAM Config 2 register is also set to 0, the DDR2/3/mDDR memory controller uses the three fields, IBANK, EBANK and PAGESIZE in the SDRAM Config register to determine the mapping from source address to SDRAM row, column, bank, and chip select. If the REG\_IBANK\_POS field in the SDRAM Config register is set to 1, 2, or 3, or the REG\_EBANK\_POS field in the SDRAM Config 2 register is set to 1, the DDR2/3/mDDR memory controller uses the 4 fields - IBANK, EBANK, PAGESIZE, and ROWSIZE in the SDRAM Config register to determine the mapping from source address to SDRAM row, column, bank, and chip select. In all cases the DDR2/3/mDDR memory controller considers its SDRAM address space to be a single logical block regardless of the number of physical devices or whether the devices are mapped across 1 or 2 DDR2/3/mDDR memory controller chip selects.

#### 7.3.3.4.1 Address Mapping when REG\_IBANK\_POS=0 and REG\_EBANK\_POS=0

For REG\_IBANK\_POS=0 and REG\_EBANK\_POS=0, the effect of address mapping scheme is that as the source address increments across DDR2/3/mDDR memory device page boundaries, the DDR2/3/mDDR controller moves onto the same page in the next bank in the current device DDR\_CS<sub>n</sub>[0]. This movement along the banks of the current proceeds to the same page in the next device (if EBANK=1, DDR\_CS<sub>n</sub>[1]) and proceeds through the same page in all its banks before moving over to the next page in the first device (DDR\_CS<sub>n</sub>[0]). The DDR2/3/mDDR controller exploits this traversal across internal banks and chip selects while remaining on the same page to maximize the number of open DDR2/3/mDDR memory device banks within the overall DDR2/3/mDDR memory device space.

Thus, the DDR2/3/mDDR controller can keep a maximum of 16 banks (8 internal banks across 2 chip selects) open at a time, and can interleave among all of them.

**Table 7-100. OCP Address to DDR2/3/mDDR Address Mapping for REG\_IBANK\_POS=0 and REG\_EBANK\_POS=0**

Logical Address			
Row Address	Chip Select	Bank Address	Column Address
	# of bits defined by EBANK of SDRCCR	# of bits defined by IBANK of SDRCCR	# of bits defined by PAGESIZE of SDRCCR
15 bits	EBANK=0 => 0 bits	IBANK=0 => 0 bits	PAGESIZE=0 => 8 bits
	EBANK=1 => 1 bit	IBANK=1 => 1 bit	PAGESIZE=1 => 9 bits
		IBANK=2 => 2 bits	PAGESIZE=2 => 10 bits
		IBANK=3 => 3 bits	PAGESIZE=3 => 11 bits

### 7.3.3.4.2 Address Mapping when REG\_IBANK\_POS = 1 and REG\_EBANK\_POS = 0

For REG\_IBANK\_POS = 1 and REG\_EBANK\_POS = 0, the interleaving of banks within a device (per chip select) is limited to 4 banks. However, it can still interleave banks between the two chip selects. Thus, the DDR2/3/mDDR controller can keep a maximum of 16 banks (8 internal banks across 2 chip selects) open at a time, but can only interleave among eight of them.

**Table 7-101. OCP Address to DDR2/3/mDDR Address Mapping for REG\_IBANK\_POS=1 and REG\_EBANK\_POS=0**

Logical Address				
Bank Address[2]	Row Address	Chip Select	Bank Address[1:0]	Column Address
# of bits defined by IBANK of SDRCR	# of bits defined by RSIZE of SDRCR	# of bits defined by EBANK of SDRCR	# of bits defined by IBANK of SDRCR	# of bits defined by PAGESIZE of SDRCR
IBANK=0 => 0 bits	RSIZE=0 => 9 bits	EBANK=0 => 0 bits	IBANK=0 => 0 bits	PAGESIZE=0 => 8 bits
IBANK=1 => 0 bits	RSIZE=1 => 10 bits	EBANK=1 => 1 bit	IBANK=1 => 1 bit	PAGESIZE=1 => 9 bits
IBANK=2 => 0 bits	RSIZE=2 => 11 bits		IBANK=2 => 2 bits	PAGESIZE=2 => 10 bits
IBANK=3 => 1 bit	RSIZE=3 => 12 bits		IBANK=3 => 3 bits	PAGESIZE=3 => 11 bits
	RSIZE=4 => 13 bits			
	RSIZE=5 => 14 bits			
	RSIZE=6 => 15 bits			
	RSIZE=7 => 16 bits			

### 7.3.3.4.3 Address Mapping when REG\_IBANK\_POS=2 and REG\_EBANK\_POS = 0

For REG\_IBANK\_POS=2 and REG\_EBANK\_POS = 0, the interleaving of banks within a device (per chip select) is limited to 2 banks. However, it can still interleave banks between the two chip selects. Thus, the DDR2/3/mDDR controller can keep a maximum of 16 banks (eight internal banks across 2 chip selects) open at a time, but can only interleave among four of them.

**Table 7-102. OCP Address to DDR2/3/mDDR Address Mapping for REG\_IBANK\_POS=2 and REG\_EBANK\_POS=0**

Logical Address				
Bank Address[2:1]	Row Address	Chip Select	Bank Address[0]	Column Address
# of bits defined by IBANK of SDRCR	# of bits defined by RSIZE of SDRCR	# of bits defined by EBANK of SDRCR	# of bits defined by IBANK of SDRCR	# of bits defined by PAGESIZE of SDRCR
IBANK=0 => 0 bits	RSIZE=0 => 9 bits	EBANK=0 => 0 bits	IBANK=0 => 0 bits	PAGESIZE=0 => 8 bits
IBANK=1 => 0 bits	RSIZE=1 => 10 bits	EBANK=1 => 1 bit	IBANK=1 => 1 bit	PAGESIZE=1 => 9 bits
IBANK=2 => 1 bit	RSIZE=2 => 11 bits		IBANK=2 => 1 bit	PAGESIZE=2 => 10 bits
IBANK=3 => 2 bits	RSIZE=3 => 12 bits		IBANK=3 => 1 bit	PAGESIZE=3 => 11 bits
	RSIZE=4 => 13 bits			
	RSIZE=5 => 14 bits			
	RSIZE=6 => 15 bits			
	RSIZE=7 => 16 bits			

### 7.3.3.4.4 Address Mapping when REG\_IBANK\_POS= 3 and REG\_EBANK\_POS = 0

For REG\_IBANK\_POS= 3 and REG\_EBANK\_POS = 0, the DDR2/3/mDDR controller cannot interleave banks within a device (per chip select). However, it can still interleave banks between the two chip selects. Thus, the DDR2/3/mDDR controller can keep a maximum of 16 banks (8 internal banks across 2 chip selects) open at a time, but can only interleave among two of them.

**Table 7-103. OCP Address to DDR2/3/mDDR Address Mapping for REG\_IBANK\_POS=3 and REG\_EBANK\_POS=0**

Logical Address			
Bank Address	Row Address	Chip Select	Column Address
# of bits defined by IBANK of SDRCR	# of bits defined by RSIZE of SDRCR	# of bits defined by EBANK of SDRCR	# of bits defined by PAGESIZE of SDRCR
IBANK=0 => 0 bits	RSIZE=0 => 9 bits	EBANK=0 => 0 bits	PAGESIZE=0 => 8 bits
IBANK=1 => 1 bit	RSIZE=1 => 10 bits	EBANK=1 => 1 bit	PAGESIZE=1 => 9 bits
IBANK=2 => 2 bits	RSIZE=2 => 11 bits		PAGESIZE=2 => 10 bits
IBANK=3 => 3 bits	RSIZE=3 => 12 bits		PAGESIZE=3 => 11 bits
	RSIZE=4 => 13 bits		
	RSIZE=5 => 14 bits		
	RSIZE=6 => 15 bits		
	RSIZE=7 => 16 bits		

#### 7.3.3.4.5 Address Mapping when REG\_IBANK\_POS = 0 and REG\_EBANK\_POS = 1

For REG\_IBANK\_POS = 0 and REG\_EBANK\_POS = 1, the DDR2/3/mDDR memory controller interleaves among all the banks within a device (per chip select). However, the DDR2/3/mDDR memory controller cannot interleave banks between the two chip selects. Thus, the DDR2/3/mDDR memory controller can keep a maximum of 16 banks (8 internal banks across 2 chip selects) open at a time, but can only interleave among 8 of them.

**Table 7-104. OCP Address to DDR2/3/mDDR Address Mapping for REG\_IBANK\_POS=0 and REG\_EBANK\_POS=1**

Logical Address			
Chip Select	Row Address	Bank Address	Column Address
# of bits defined by EBANK of SDRCR	# of bits defined by RSIZE of SDRCR	# of bits defined by IBANK of SDRCR	# of bits defined by PAGESIZE of SDRCR
EBANK=0 => 0 bits	RSIZE=0 => 9 bits	IBANK=0 => 0 bits	PAGESIZE=0 => 8 bits
EBANK=1 => 1 bit	RSIZE=1 => 10 bits	IBANK=1 => 1 bit	PAGESIZE=1 => 9 bits
	RSIZE=2 => 11 bits	IBANK=2 => 2 bits	PAGESIZE=2 => 10 bits
	RSIZE=3 => 12 bits	IBANK=3 => 3 bits	PAGESIZE=3 => 11 bits
	RSIZE=4 => 13 bits		
	RSIZE=5 => 14 bits		
	RSIZE=6 => 15 bits		
	RSIZE=7 => 16 bits		

#### 7.3.3.4.6 Address Mapping when REG\_IBANK\_POS = 1 and REG\_EBANK\_POS = 1

For REG\_IBANK\_POS = 1 and REG\_EBANK\_POS = 1, the interleaving of banks within a device (per chip select) is limited to 4 banks. Also, the DDR2/3/mDDR memory controller cannot interleave banks between the two chip selects. Thus, the DDR2/3/mDDR memory controller can keep a maximum of 16 banks (8 internal banks across 2 chip selects) open at a time, but can only interleave among four of them.

**Table 7-105. OCP Address to DDR2/3/mDDR Address Mapping for REG\_IBANK\_POS=1 and REG\_EBANK\_POS = 1**

Logical Address				
Chip Select	Bank Address[2]	Row Address	Bank Address[1:0]	Column Address
# of bits defined by EBANK of SDRCR	# of bits defined by IBANK of SDRCR	# of bits defined by RSIZE of SDRCR	# of bits defined by IBANK of SDRCR	# of bits defined by PAGESIZE of SDRCR
EBANK=0 => 0 bits	IBANK=0 => 0 bits	RSIZE=0 => 9 bits	IBANK=0 => 0 bits	PAGESIZE=0 => 8 bits
EBANK=1 => 1 bit	IBANK=1 => 0 bits	RSIZE=1 => 10 bits	IBANK=1 => 1 bit	PAGESIZE=1 => 9 bits

**Table 7-105. OCP Address to DDR2/3/mDDR Address Mapping for REG\_IBANK\_POS=1 and REG\_EBANK\_POS = 1 (continued)**

Logical Address				
Chip Select	Bank Address[2]	Row Address	Bank Address[1:0]	Column Address
	IBANK=2 => 0 bits	RSIZE=2 => 11 bits	IBANK=2 => 2 bits	PAGESIZE=2 => 10 bits
	IBANK=3 => 1 bit	RSIZE=3 => 12 bits	IBANK=3 => 2 bits	PAGESIZE=3 => 11 bits
		RSIZE=4 => 13 bits		
		RSIZE=5 => 14 bits		
		RSIZE=6 => 15 bits		
		RSIZE=7 => 16 bits		

#### 7.3.3.4.7 Address Mapping when REG\_IBANK\_POS = 2 and REG\_EBANK\_POS = 1

For REG\_IBANK\_POS = 2 and REG\_EBANK\_POS = 1, the interleaving of banks within a device (per chip select) is limited to 2 banks. Also, the DDR2/3/mDDR memory controller cannot interleave banks between the two chip selects. Thus, the DDR2/3/mDDR memory controller can keep a maximum of 16 banks (8 internal banks across 2 chip selects) open at a time, but can only interleave among two of them.

**Table 7-106. OCP Address to DDR2/3/mDDR Address Mapping for REG\_IBANK\_POS=2 and REG\_EBANK\_POS = 1**

Logical Address				
Chip Select	Bank Address[2:1]	Row Address	Bank Address[0]	Column Address
# of bits defined by EBANK of SDRCR	# of bits defined by IBANK of SDRCR	# of bits defined by RSIZE of SDRCR	# of bits defined by IBANK of SDRCR	# of bits defined by PAGESIZE of SDRCR
EBANK=0 => 0 bits	IBANK=0 => 0 bits	RSIZE=0 => 9 bits	IBANK=0 => 0 bits	PAGESIZE=0 => 8 bits
EBANK=1 => 1 bit	IBANK=1 => 0 bits	RSIZE=1 => 10 bits	IBANK=1 => 1 bit	PAGESIZE=1 => 9 bits
	IBANK=2 => 1 bit	RSIZE=2 => 11 bits	IBANK=2 => 1 bit	PAGESIZE=2 => 10 bits
	IBANK=3 => 2 bits	RSIZE=3 => 12 bits	IBANK=3 => 1 bit	PAGESIZE=3 => 11 bits
		RSIZE=4 => 13 bits		
		RSIZE=5 => 14 bits		
		RSIZE=6 => 15 bits		
		RSIZE=7 => 16 bits		

#### 7.3.3.4.8 Address Mapping when REG\_IBANK\_POS = 3 and REG\_EBANK\_POS = 1

For REG\_IBANK\_POS = 3 and REG\_EBANK\_POS = 1, the DDR2/3/mDDR memory controller cannot interleave banks within a device (per chip select) or between the two chip selects. Thus, the DDR2/3/mDDR memory controller can keep a maximum of 16 banks (8 internal banks across two chip selects) open at a time, but cannot interleave among of them.

**Table 7-107. OCP Address to DDR2/3/mDDR Address Mapping for REG\_IBANK\_POS=3 and REG\_EBANK\_POS=1**

Logical Address			
Chip Select	Bank Address	Row Address	Column Address
# of bits defined by EBANK of SDRCR	# of bits defined by IBANK of SDRCR	# of bits defined by RSIZE of SDRCR	# of bits defined by PAGESIZE of SDRCR
EBANK=0 => 0 bits	IBANK=0 => 0 bits	RSIZE=0 => 9 bits	PAGESIZE=0 => 8 bits
EBANK=1 => 1 bit	IBANK=1 => 1 bit	RSIZE=1 => 10 bits	PAGESIZE=1 => 9 bits
	IBANK=2 => 2 bits	RSIZE=2 => 11 bits	PAGESIZE=2 => 10 bits
	IBANK=3 => 3 bits	RSIZE=3 => 12 bits	PAGESIZE=3 => 11 bits
		RSIZE=4 => 13 bits	
		RSIZE=5 => 14 bits	

**Table 7-107. OCP Address to DDR2/3/mDDR Address Mapping for REG\_IBANK\_POS=3 and REG\_EBANK\_POS=1 (continued)**

Logical Address			
Chip Select	Bank Address	Row Address	Column Address
		RSize=6 => 15 bits	
		RSize=7 => 16 bits	

Since the DDR2/3/mDDR memory controller interleaves among less number of banks when IBANK\_POS!= 0 or EBANK\_POS= 1, these cases are lower in performance than the IBANK\_POS= 0 case. Thus these cases are only recommended to be used along with partial array self-refresh where performance can be traded off for power savings.

### 7.3.3.5 Performance Management

#### 7.3.3.5.1 Command Ordering and Scheduling

The DDR2/3/mDDR memory controller performs command re-ordering and scheduling in an attempt to achieve efficient transfers with maximum throughput. The goal is to maximize the utilization of the data, address, and command buses while hiding the overhead of opening and closing DDR2/3/mDDR SDRAM rows. Command re-ordering takes place within the command FIFO.

The DDR2/3/mDDR memory controller examines all the commands stored in the command FIFO to schedule commands to the external memory. All commands from same master will complete in order, regardless of the master priority. The memory controller does not guarantee ordering between commands from different masters. However, the memory controller will maintain data coherency. Therefore, the memory controller will block a command, regardless of master priority, if that command is to the same block address (2048 bytes) as an older command. Thus, the memory controller might have one or more pending read or write for each master. Among all pending reads, the memory controller selects all reads that have their corresponding SDRAM banks already open. Similarly, among all pending writes, the memory controller selects all writes that have their corresponding SDRAM banks already open.

As a result of the above reordering, at any point of time the memory controller might have several pending reads and writes that have their corresponding banks open. The memory controller then selects the highest priority read from pending reads, and the highest priority write from pending writes. If two or more commands have the highest priority, the memory controller selects the oldest command. As a result, the memory controller might now have a final read and a final write command. The memory controller will pick either the read or the write command depending on the value programmed in the Read Write Execution Threshold register. The memory controller will keep executing reads until the read threshold is met and then switch to executing writes. The memory controller will then keep executing writes until the write threshold is met and then switch back to executing reads. The memory controller will satisfy meeting the threshold values only if that type of command is available for execution, otherwise it will switch to the other type. Similarly, the memory controller will satisfy meeting the threshold value only if the FIFOs for that type have space (Read Data FIFO for reads and Write Status FIFO for writes), otherwise it will switch to the other type.

The memory controller completes executing an OCP command before it switches to another command.

All the accesses to an SDRAM are pipe-lined to maximize the external bus utilization. In other words accesses to an SDRAM are issued back to back such that there are minimum idle cycles between any two accesses. This includes the scheduling listed above to minimize the overhead of opening and closing of SDRAM banks. All of these is done while fulfilling the access timing requirements of an SDRAM.

Besides commands received from on-chip resources, the DDR2/3/mDDR memory controller also issues refresh commands. The DDR2/3/mDDR memory controller attempts to delay refresh commands as long as possible to maximize performance while meeting the SDRAM refresh requirements. As the DDR2/3/mDDR memory controller issues read, write, and refresh commands to DDR2/3/mDDR SDRAM device, it follows the following priority scheme:

1. (Highest priority) SDRAM refresh request due to Refresh Must level of refresh urgency reached (see [Section 7.3.3.5.5](#)).

2. Request for a read or a write.
3. SDRAM Activate commands.
4. SDRAM Deactivate commands.
5. SDRAM Deep Power-Down request.
6. SDRAM clock stop or Power-Down request.
7. SDRAM refresh request due to Refresh May or Release level of refresh urgency reached (Refer Section Refresh Scheduling)
8. (Lowest priority) SDRAM self-refresh request.

#### 7.3.3.5.2 Command Starvation

The reordering and scheduling rules listed above may lead to command starvation, which is the prevention of certain commands from being processed by the DDR2/3/mDDR memory controller. Command starvation results from the following conditions:

- A continuous stream of high-priority read commands can block a low-priority write command
- A continuous stream of DDR2/3/mDDR SDRAM commands to a row in an open bank can block commands to the closed row in the same bank.

To avoid these conditions, the DDR2/3/mDDR memory controller can momentarily raise the priority of the oldest command in the command FIFO after a set number of transfers have been made. The REG\_COS\_COUNT\_1,REG\_COS\_COUNT\_2 field in the Interface Configuration Register (INT\_CONFIG) sets the number of the transfers that must be made before the DDR2/3/mDDR memory controller will raise the priority of the oldest command. See Class of Service (COS) section for more details.

---

**NOTE:** Leaving the REG\_COS bits at their default value (FFh) in the Interface Configuration register (INT\_CONFIG) disables this feature of the DDR2/3/mDDR memory controller. This means commands can stay in the command FIFO indefinitely. Therefore, these bits should be set to FEh immediately following reset to enable this feature with the highest level of allowable memory transfers. It is suggested that system-level prioritization be set to avoid placing high-bandwidth masters on the highest priority levels. These bits can be left as FEh unless advanced bandwidth/prioritization control is required.

---

#### 7.3.3.5.3 Possible Race Condition

A race condition may exist when certain masters write data to the DDR2/3/mDDR memory controller. For example, if master A passes a software message via a buffer in DDR2/3/mDDR memory and does not wait for indication that the write completes, when master B attempts to read the software message it may read stale data and therefore receive an incorrect message. In order to confirm that a write from master A has landed before a read from master B is performed, master A must wait for the write completion status from the DDR2/3/mDDR memory controller before indicating to master B that the data is ready to be read. If master A does not wait for indication that a write is complete, it must perform the following workaround:

1. Perform the required write.
2. Perform a dummy write to the DDR2 memory controller module ID and revision register.
3. Perform a dummy read to the DDR2 memory controller module ID and revision register.
4. Indicate to master B that the data is ready to be read after completion of the read in step 3.

The completion of the read in step 3 ensures that the previous write was done.

For a list of the master peripherals that need this workaround, see the device-specific data sheet.

#### 7.3.3.5.4 Class of Service (COS)

The commands in the Command FIFO can be mapped to 2 classes of service namely 1 and 2. The mapping of commands to a particular class of service can be done based on the priority or the connection ID.

The mapping based on priority can be done by setting the appropriate values in the Priority to Class of Service Mapping register (PRI\_COS\_MAP).

The mapping based on connection ID can be done by setting the appropriate values of connection ID and the masks in the Connection ID to Class of Service Mapping registers (CONNID\_COS\_1\_MAP and CONNID\_COS\_2\_MAP).

There are 3 connection ID and mask values that can be set for each class of service. In conjunction with the masks, each class of service can have a maximum of 144 connection IDs mapped to it. For example, a connection ID value of 0xFF along with a mask value of 0x3 will map all connection IDs from 0xF8 to 0xFF to that particular class of service.

Each class of service has an associated latency counter (REG\_COS\_COUNT). The value of this counter can be set in the Interface Configuration Register. When the latency counter for a command expires, i.e., reaches the value programmed for the class of service that the command belongs to, that command will be the one that is executed next. If there are more than one commands that have expired latency counters, the command with the highest priority will be executed first. One exception to this rule is, if the oldest command in the queue has an expired reg\_pr\_old\_count, that command will be executed first irrespective of priority or class of service. This is done to prevent a continuous block effect.

The connection ID mapping allows the same connection ID to be put in both class of service 1 and 2. Also, a transaction might belong to one class of service if viewed by connection ID and might belong to another class of service if viewed by priority. In these cases, the command will belong to both class of service. The DDR2/3/mDDR memory controller will try executing the command as soon as possible, when the smaller of the two counters ( REG\_COS\_COUNT\_1 OR REG\_COS\_COUNT\_2) expire.

#### 7.3.3.5.5 Refresh Scheduling

The DDR2/3/mDDR memory controller issues autorefresh (REFR) commands to DDR2/3/mDDR SDRAM devices at a rate defined in the refresh rate (REFRESH\_RATE) bit field in the SDRAM refresh control register (SDRFC). A refresh interval counter is loaded with the value of the REFRESH\_RATE bit field and decrements by 1 each cycle until it reaches zero. Once the interval counter reaches zero, it reloads with the value of the REFRESH\_RATE bit. Each time the interval counter expires, a refresh backlog counter increments by 1. Conversely, each time the DDR2/3/mDDR memory controller performs a REFR command, the backlog counter decrements by 1. This means the refresh backlog counter records the number of REFR commands the DDR2/3/mDDR memory controller currently has outstanding.

The DDR2/3/mDDR memory controller issues REFR commands based on the level of urgency. The level of urgency is defined below. Whenever the refresh level of urgency is reached, the DDR2/3/mDDR memory controller issues a REFR command before servicing any new memory access requests. Following a REFR command, the DDR2/3/mDDR memory controller waits T\_RFC cycles, defined in the SDRAM timing 1 register (SDRTIM1), before rechecking the refresh urgency level.

The refresh counters do not operate when the SDRAM memory is in self-refresh mode.

**Table 7-108. Refresh Modes**

Urgency Level	Description
Refresh May	Backlog count is greater than 0. Indicates there is a backlog of REFR commands, when the DDR2/3/mDDR memory controller is not busy it will issue the REFR command.
Refresh Release	Backlog count is greater than 4. Indicates that the refresh backlog of REFR commands is getting high and when DDR2/3/mDDR memory controller is not busy it should issue the REFR command.
Refresh Must	Backlog count is greater than 7. Indicates that the refresh backlog of REFR commands is getting excessive and DDR2/3/mDDR memory controller should perform an auto refresh cycle before servicing any new memory access requests.

The DDR2/3/mDDR memory controller starts servicing new memory accesses after Refresh Release level is cleared. If any of the commands in the Command FIFO have class of service latency counters that are expired, the DDR2/3/mDDR memory controller will not wait for Refresh Release level to be cleared but will only perform one refresh command and exit the refresh state.

### 7.3.3.5.6 Performance Counter Configuration

Table 7-109 shows the possible filter configurations for the two performance counters (REG\_CNTR1\_CFG and REG\_CNTR2\_CFG). These filter configurations can be used in conjunction with an OCP connection ID and/or an external chip select to obtain performance statistics for a particular OCP master and/or an external chip select.

**Table 7-109. Filter Configurations for Performance Counters**

cntrN_cfg <sup>(1)</sup>	cntrN_region_en	cntrN_mconnid_en	Description
0x0	0x0	0x0 or 0x1	Count total SDRAM accesses.
0x1	0x0	0x0 or 0x1	Count total SDRAM activations.
0x2	0x0 or 0x1	0x0 or 0x1	Count total reads.
0x3	0x0 or 0x1	0x0 or 0x1	Count total writes.
0x4	0x0	0x0	Count number of DDR clock cycles OCP Command FIFO is full.
0x5	0x0	0x0	Count number of DDR clock cycles OCP Write Data FIFO is full.
0x6	0x0	0x0	Count number of DDR clock cycles OCP Read Data FIFO is full.
0x7	0x0	0x0	Count number of DDR clock cycles OCP Return Command FIFO is full.
0x8	0x0 or 0x1	0x0 or 0x1	Count number of priority elevations.
0x9	0x0	0x0	Count number of DDR clock cycles that a command was pending.
0xA	0x0	0x0	Count number of DDR clock cycles for which the memory data bus was transferring data.
0xB - 0xF	0x0	0x0	Reserved for future use.

<sup>(1)</sup> When MReqDebug is set to a 1 for a particular OCP command, the performance counters will not be incremented for that particular command if the cntrN\_cfg values are equal to 0x0, 0x1, 0x2, 0x3, or 0xA.

### 7.3.3.6 DDR3 Read-Write Leveling

The DDR2/3/mDDR memory controller supports read-write leveling in conjunction with the DDR PHY. The DDR2/3/mDDR memory controller supports two types of write/read leveling:

1. Full leveling
2. Incremental leveling

---

**NOTE:** Please refer the device specific data sheet to know the type of leveling supported.

---

Each leveling type has three parts:

1. Write leveling
2. Read DQS gate training
3. Read data eye training

Read and write leveling is only supported to DDR3 memory.

The DDR2/3/mDDR memory controller does not perform full leveling after initialization upon reset deassertion. Full leveling must be triggered by software after the DDR2/3/mDDR memory controller registers are properly configured. The DDR2/3/mDDR memory controller supports triggering of full leveling through software through the use of the REG\_RDWRLVLFULL\_START field in the Read-Write Leveling Control register (RWLCR). Since full leveling takes considerable amount of time and refreshes cannot be issued to DDR3 when DDR3 is put in leveling mode, refresh interval will be violated and data inside DDR3 can be lost. Although, this is not an issue at power-up, this might be an issue if full leveling is triggered when DDR3 is functional.

The memory controller supports incremental leveling to better track voltage and temperature changes during normal operation. The incremental leveling can be enabled by writing a non-zero value to the REG\_WRLVLINC\_INT, REG\_RDLVLGATEINC\_INT, and REG\_RDLVLINC\_INT fields in the Read-Write Leveling Control register (RWLCR). The memory controller periodically triggers incremental write leveling every time REG\_WRLVLINC\_INT expires. In other words, the REG\_WRLVLINC\_INT defines the interval between successive incremental write leveling.

Similarly, the memory controller periodically triggers incremental read DQS gate training every time REG\_RDLVLGATEINC\_INT expires, and triggers incremental read data eye training every time REG\_RDLVLINC\_INT expires.

To minimize impact on bandwidth, the software can program these intervals such that these three intervals do not expire at same time. The value of interval programmed is dependent on the slope of voltage and temperature changes.

The memory controller supports increasing the rate of incremental leveling automatically for a defined period of time. This can be achieved by programming the Read-Write Leveling Ramp Window register (RDWR\_LVL\_RMP\_WIN) and the Read-Write Leveling Ramp Control register (RDWR\_LVL\_RMP\_CTRL). Whenever a pulse is received, the memory controller would use the intervals programmed in the Read-Write Leveling Ramp Control register until the REG\_RDWRLVLINC\_RMP\_WIN in the Read-Write Leveling Ramp Window register expires. After the expiration of REG\_RDWRLVLINC\_RMP\_WIN the memory controller switches back to use the intervals programmed in the Read-Write Leveling Control register.

To guarantee none of the incremental leveling events are missed, the REG\_RDWRLVLINC\_RMP\_WIN must be programmed greater than the intervals in the Read-Write Leveling Ramp Control register.

If the memory controller is in Self-Refresh or Power-Down modes when any of the incremental leveling intervals expire, the memory controller will exit Self-Refresh or Power-Down mode, perform the required leveling, and then re-enter the Self-Refresh or Power-Down mode. The memory controller also triggers incremental leveling on Self-Refresh exit.

### 7.3.3.7 PRCM Sequence for DDR2/3/mDDR Memory controller

The memory controller clock, reset and power are handled by the device PRCM module. Refer to the Power Reset Clock Management (PRCM) chapter for the PRCM register details.

### 7.3.3.8 Interrupt Support

The DDR2/3/mDDR controller is compliant with Open Core Protocol Specification (OCP-IP 2.2). The controller supports only Idle, Write, Read, and WriteNonPost command types. Also, the controller supports only incrementing, wrapping, and 2-dimensional block addressing modes. The controller supports generation of an error interrupt if an unsupported command or a command with unsupported addressing mode is received.

### 7.3.3.9 EDMA Event Support

The DDR2/3/mDDR memory controller is a DMA slave peripheral and therefore does not generate EDMA events. Data read and write requests may be made directly by masters including the EDMA controller.

### 7.3.3.10 Emulation Considerations

The DDR2/3/mDDR memory controller will remain fully functional during emulation halts to allow emulation access to external memory.

### 7.3.3.11 Power Management

This section defines the power management capabilities and requirements.

#### 7.3.3.11.1 Clock Stop Mode

The memory controller supports Clock Stop mode for LPDDR1/mDDR. The memory controller automatically stops the clocks to the memory, after the memory controller is idle for REG\_CS\_TIM number of DDR clock cycles and the REG\_LP\_MODE field is set to 1. The REG\_LP\_MODE and REG\_CS\_TIM fields can be programmed in the power management control register (PMCR).

When the clock to the memory is stopped, the memory controller services register accesses as normal. If an SDRAM access is requested, or the Refresh Must level is reached while in the Clock Stop mode, the memory controller will start the clocks. The memory controller now can issue any commands. If the power saving mode is changed by changing REG\_LP\_MODE from 1 to some other value, the memory controller will exit Clock Stop mode and enter the new power saving mode.

#### 7.3.3.11.2 Self-Refresh Mode

The DDR2/3/mDDR memory controller supports self-refresh mode for low power. The memory controller automatically puts the SDRAM into self-refresh after the memory controller is idle for REG\_SR\_TIM number of DDR clock cycles and the REG\_LP\_MODE field is set to 2. The REG\_LP\_MODE and REG\_SR\_TIM fields can be programmed in the Power Management Control register (PMCR). The memory controller will complete all pending refreshes before it puts the SDRAM into self-refresh. Therefore, after the expiration of REG\_SR\_TIM, the memory controller will start issuing refreshes to complete the refresh backlog, and then issue a SELF-REFRESH command to the SDRAM.

In self-refresh mode, the memory controller automatically stops the clocks DDR\_CLK to the SDRAM. The memory controller maintains DDR\_CKE low to maintain the self-refresh state. When the SDRAM is in self-refresh, the memory controller services register accesses as normal. If the REG\_LP\_MODE field is set not equal to 2, or an SDRAM access is requested while it is in self-refresh, and T\_CKE + 1 cycles have elapsed since the SELF-REFRESH command was issued, the memory controller will bring the SDRAM out of self-refresh. The value of T\_CKE is taken from SDRAM Timing 2 register. For DDR3, memory controller will also exit self-refresh to perform incremental leveling.

**Exit sequence of self-refresh mode for LPDDR1 device:** The memory controller:

- Enables clocks.
- Drives DDR\_CKE high.
- Waits for T\_XSNR + 1 cycles. The value of T\_XSNR is taken from SDRAM Timing 2 register.
- Starts an auto-refresh cycle in the next cycle.
- Enters its idle state and can issue any commands.

**Exit sequence of self-refresh mode for DDR2 device:** The memory controller:

- Enables clocks.
- Drives DDR\_CKE high.
- Waits for T\_XSNR + 1 cycles. The value of T\_XSNR is taken from SDRAM Timing 2 register.
- If the REG\_DDR\_DISABLE\_DLL bit in the SDRAM Config register is 1, issues a LOAD MODE REGISTER command to the extended mode register 1 with the pad\_a\_o bits set as follows:

Bits	Value	Description
DDR_A[15:13]	0x0	!reg_dds2_ddqs
DDR_A[12]	0x0	Output buffer enabled
DDR_A[11]	0x0	RDQS disable
DDR_A[10]	!reg_dds2_ddqs	Differential DQS enable value from SDRAM Config register
DDR_A[9:7]	0x0	Exit OCD calibration mode
DDR_A[6]	reg_dds2_term[1]	DDR2 termination resistor value from SDRAM Config register
DDR_A[5:3]	0x0	Additive latency = 0
DDR_A[2]	reg_dds2_term[0]	DDR2 termination resistor value from SDRAM Config register

Bits	Value	Description
DDR_A[1]	reg_sdram_drive	SDRAM drive strength from SDRAM Config register
DDR_A[0]	0x1	Disable DLL

- Starts an auto-refresh cycle in the next cycle.
- Enters its idle state and can issue any other commands except a write or a read. A write or a read will only be issued after T\_XSRD + 1 clock cycles have elapsed since DDR\_CKE is driven high. The value of T\_XSRD is taken from SDRAM Timing 2 register.

Exit sequence of self-refresh mode for DDR3 device: The memory controller:

- Enables clocks.
- Drives DDR\_CKE high.
- Waits for T\_XSNR + 1 cycles. The value of T\_XSNR is taken from SDRAM Timing 2 register.
- If the REG\_DDR\_DISABLE\_DLL bit in the SDRAM Config register is 1, issues a LOAD MODE REGISTER command to the extended mode register 1 with the pad\_a\_o bits set as follows:

Bits	Value	Description
DDR_A[15:13]	0x0	Reserved
DDR_A[12]	0x0	Output buffer enabled
DDR_A[11]	0x0	TDQS disable
DDR_A[10]	0x0	Reserved
DDR_A[9]	reg_ddr_term[2]	DDR3 termination resistor value from SDRAM Config register
DDR_A[8]	0x0	Reserved
DDR_A[7]	0x0	Write leveling disabled
DDR_A[6]	reg_ddr_term[1]	DDR3 termination resistor value from SDRAM Config register
DDR_A[5]	reg_sdram_drive[1]	SDRAM drive strength from SDRAM Config register
DDR_A[4:3]	0x0	Additive latency = 0
DDR_A[2]	reg_ddr_term[0]	DDR3 termination resistor value from SDRAM Config register
DDR_A[1]	reg_sdram_drive[0]	SDRAM drive strength from SDRAM Config register
DDR_A[0]	0x1	Disable DLL

- Starts an auto-refresh cycle in the next cycle.
- Performs one write incremental leveling.
- Performs read DQS incremental training.
- Performs read data-eye incremental training.
- Enters its idle state and can issue any other commands except a write or a read. A write or a read will only be issued after T\_XSRD + 1 clock cycles have elapsed since DDR\_CKE is driven high. The value of T\_XSRD is taken from SDRAM Timing 2 register.

### 7.3.3.11.3 Power Down Mode

The memory controller also supports power-down mode for low power. The memory controller automatically puts the SDRAM into power-sDown after the memory controller is idle for REG\_PD\_TIM number of DDR clock cycles and the REG\_LP\_MODE field is set to 4. The REG\_LP\_MODE and REG\_PD\_TIM fields can be programmed in the Power Management Control register (PMCR). If the Refresh Must level is not reached before the entry into power-down, the memory controller will not precharge all banks before issuing the POWER-DOWN command. This will result in SDRAM entering active power-down mode.

If the Refresh Must level is reached before the entry into power-down, the memory controller will precharge all banks and issue refreshes until the Refresh Release Level is reached before issuing the POWER-DOWN command. This will result in SDRAM entering precharge power-down mode.

In power-down mode, the memory controller does not stop the clocks DDR\_CLK to the SDRAM. The memory controller maintains DDR\_CKE low to maintain the power-down state.

When the SDRAM is in power-down, the memory controller services register accesses as normal. If the REG\_LP\_MODE field is set not equal to 4, or an SDRAM access is requested, or the Refresh Must level is reached while the SDRAM is in power-down, the memory controller will bring the SDRAM out of power-down. For DDR3, memory controller will also exit power-down to perform incremental leveling.

Exit sequence of power-down mode for DDR2, DDR3 and LPDDR1: The memory controller

- Drives DDR\_CKE high after T\_CKE + 1 cycles have elapsed since the POWER-DOWN command was issued. The value of T\_CKE is taken from SDRAM Timing 2 register.
- Waits for T\_XP + 1 cycles. The value of T\_XP is taken from SDRAM Timing 2 register.
- Enters its idle state and can issue any commands.

#### 7.3.3.11.4 Deep Power-Down Mode

For ultimate power savings, the memory controller supports deep power-down mode for LPDDR1.

The SDRAM can be forced into deep power-down through software by setting the reg\_dpd\_en field in the Power Management Control register to 1. In this case, the memory controller will continue normal operation until all SDRAM memory access requests have been serviced. At this point the memory controller will issue a DEEP POWER-DOWN command. The memory controller then maintains pad\_cke\_o low to maintain the Deep Power-Down state. In deep power-down mode, the memory controller automatically stops the clocks to the SDRAM.

Setting the REG\_DPD\_EN field to 1 overrides the setting of REG\_LP\_MODE field. Therefore, if the SDRAM is in Clock Stop, Self Refresh, or Power-Down mode, and REG\_DPD\_EN field is set to 1, the memory controller will exit those modes and go into deep power-down mode.

When the SDRAM is in deep power-down, the memory controller services register accesses as normal.

If the REG\_DPD\_EN field is set to 0, or an SDRAM access is requested, the memory controller will bring the SDRAM out of deep power-down.

Exit sequence for LPDDR1: The memory controller:

- Performs SDRAM initialization as specified in the LPDDR1(mDDR) SDRAM Memory Initialization section.
- Enters its idle state and can issue any commands.

Since the memory controller performs initialization upon deep power-down exit, the REG\_REFRESH\_RATE field in the SDRAM Refresh Control register must be set appropriately to meet the 200 $\mu$ s wait requirement for LPDDR1.

#### 7.3.3.11.5 Save and Restore Mode

The DDR2/3/mDDR memory controller supports save and restore mechanism to completely switch off power to the DDR2/3/mDDR memory controller. The following sequence of operations is followed to put DDR2/3/mDDR memory controller in off mode:

An external master reads the following memory mapped registers and saves their value external to the DDR2/3/mDDR memory controller.

1. SDRAM Config register (SDRCR)
2. SDRAM Config 2 register
3. SDRAM Refresh Control register (SDRRCR)
4. SDRAM Refresh Control Shadow register (SDRRCRCSR)
5. SDRAM Timing 1 register (SDRTIM1)
6. SDRAM Timing 1 Shadow register (SDRTIM1SR)
7. SDRAM Timing 2 register (SDRTIM2)
8. SDRAM Timing 2 Shadow register (SDRTIM2SR)
9. SDRAM Timing 3 register (SDRTIM3)
10. SDRAM Timing 3 Shadow register (SDRTIM3SR)
11. Power Management Control register (PMCR)

12. Power Management Control Shadow register (PMCSR)
  13. Interface Configuration register (INT\_CONFIG)
  14. System OCP Interrupt Enable Set Register (SOIESR)
  15. DDR PHY Control 1 register (DDRPHYCR)
  16. DDR PHY Control 1 Shadow register (DDRPHYCSR)
- Memory controller completes all pending transactions and drains all its FIFOs.
  - Memory controller puts the SDRAM in Self Refresh.
  - Memory controller copies all shadow memory mapped registers to its main registers. It is assumed that the shadow register always has the same value as its corresponding main register.
  - Memory controller waits for all interrupts to be serviced.
  - Memory controller acknowledges assertion of internal power down request.
  - The internal module reset signal is asserted.
  - The clocks and power to the memory controller can now be switched off.

To restore power to the memory controller, the following sequence of operations is followed:

- The power and clocks to the Memory controller are switched on.
- The internal module reset signal is deasserted, indicating to the Memory controller that it is waking up from off mode.
- The memory controller does not perform SDRAM initialization and forces its state machine to be in self-refresh.
- The external master restores all of the above memory mapped registers.
- The external master restores all of the above memory mapped registers.
- The system can now perform access to the external memory.

#### 7.3.3.11.6 EMIF PHY Clock Gating

The clock to the DDR2/3/mDDR PHY can be gated off to achieve power saving. For more information, see the EMIF0/1 Clock Gate Control register (EMIF\_CLK\_GATE).

### 7.3.4 Use Cases

For details on connecting this device to mDDR/DDR2/DDR3 devices, see the device-specific data sheet, which will include specific instructions and routing guidelines for interfacing to mDDR (LPDDR), DDR2, and DDR3 devices.

### 7.3.5 EMIF4D Registers

[Table 7-110](#) lists the memory-mapped registers for the EMIF4D. All register offset addresses not listed in [Table 7-110](#) should be considered as reserved locations and the register contents should not be modified.

**Table 7-110. EMIF4D REGISTERS**

Offset	Acronym	Register Name	Section
0h	EMIF_MOD_ID_REV		<a href="#">Section 7.3.5.1</a>
4h	STATUS		<a href="#">Section 7.3.5.2</a>
8h	SDRAM_CONFIG		<a href="#">Section 7.3.5.3</a>

### 7.3.5.1 EMIF\_MOD\_ID\_REV Register (offset = 0h) [reset = 40440C03h]

EMIF\_MOD\_ID\_REV is shown in [Figure 7-91](#) and described in [Table 7-111](#).

**Figure 7-91. EMIF\_MOD\_ID\_REV Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-111. EMIF\_MOD\_ID\_REV Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-30	reg_scheme	R	1h	Used to distinguish between old and current schemes.
29-28	Reserved	R	0h	
27-16	reg_module_id	R	44h	EMIF module ID.
15-11	reg_rtl_version	R	1h	RTL Version.
10-8	reg_major_revision	R	4h	Major Revision.
7-6	Reserved	R	0h	
5-0	reg_minor_revision	R	3h	Minor Revision.

### 7.3.5.2 STATUS Register (offset = 4h) [reset = 0h]

STATUS is shown in [Figure 7-92](#) and described in [Table 7-112](#).

**Figure 7-92. STATUS Register**

31	30	29	28	27	26	25	24
reg_be	reg_dual_clk_mode	reg_fast_init	Reserved				
R-0h	R-0h	R-0h	R-0h				
23	22	21	20	19	18	17	16
Reserved							
R-0h							
15	14	13	12	11	10	9	8
Reserved							
R-0h							
7	6	5	4	3	2	1	0
Reserved					reg_phy_dll_ready	Reserved	
R-0h					R-0h	R-0h	

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-112. STATUS Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	reg_be	R	0h	Big Endian. Reflects the value on the config_big_endian port that defines whether the EMIF is in big or little endian mode. 0 = Little endian. 1 = Big endian.
30	reg_dual_clk_mode	R	0h	Dual Clock mode. Reflects the value on the config_dual_clk_mode port that defines whether the ocp_clk and m_clk are asynchronous. 0 = ocp_clk = m_clk. 1 = Asynchronous ocp_clk and m_clk.
29	reg_fast_init	R	0h	Fast Init. Reflects the value on the config_fast_init port that defines whether the EMIF fast initialization mode has been enabled. 0 = Fast init disabled. 1 = Fast init enabled.
28-3	Reserved	R	0h	
2	reg_phy_dll_ready	R	0h	DDR PHY Ready. Reflects the value on the phy_ready port (active high) that defines whether the DDR PHY is ready for normal operation.
1-0	Reserved	R	0h	

### 7.3.5.3 SDRAM\_CONFIG Register (offset = 8h) [reset = 0h]

SDRAM\_CONFIG is shown in [Figure 7-93](#) and described in [Table 7-113](#).

**Figure 7-93. SDRAM\_CONFIG Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-113. SDRAM\_CONFIG Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-29	reg_sdrām_type	R/W	0h	SDRAM Type selection. Set to 0 for DDR1, set to 1 for LPDDR1, set to 2 for DDR2, set to 3 for DDR3. All other values are reserved.
28-27	reg_ibank_pos	R/W	0h	Internal bank position. Set to 0 to assign internal bank address bits from lower OCP address bits, as shown in the tables for OCP Address to DDR2/3/mDDR Address Mapping. Set to 1, 2, or 3 to assign internal bank address bits from higher OCP address, as shown in the tables for OCP Address to DDR2/3/mDDR Address Mapping.
26-24	reg_ddr_term	R/W	0h	DDR2 and DDR3 termination resistor value. Set to 0 to disable termination. For DDR2, set to 1 for 75 ohm, set to 2 for 150 ohm, and set to 3 for 50 ohm. For DDR3, set to 1 for RZQ/4, set to 2 for RZQ/2, set to 3 for RZQ/6, set to 4 for RZQ/12, and set to 5 for RZQ/8. All other values are reserved.
23	reg_ddr2_ddqs	R/W	0h	DDR2 differential DQS enable. Set to 0 for single ended DQS. Set to 1 for differential DQS.
22-21	reg_dyn_odt	R/W	0h	DDR3 Dynamic ODT. Set to 0 to turn off dynamic ODT. Set to 1 for RZQ/4 and set to 2 for RZQ/2. All other values are reserved.
20	reg_ddr_disable_dll	R/W	0h	Disable DLL select. Set to 1 to disable DLL inside SDRAM.
19-18	reg_sdrām_drive	R/W	0h	SDRAM drive strength. For DDR1/DDR2, set to 0 for normal, and set to 1 for weak drive strength. For DDR3, set to 0 for RZQ/6 and set to 1 for RZQ/7. For LPDDR1, set to 0 for full, set to 1 for 1/2, set to 2 for 1/4, and set to 3 for 1/8 drive strength. All other values are reserved.
17-16	reg_cwl	R/W	0h	DDR3 CAS Write latency. Value of 0, 1, 2, and 3 (CAS write latency of 5, 6, 7, and 8) are supported. Use the lowest value supported for best performance. All other values are reserved.

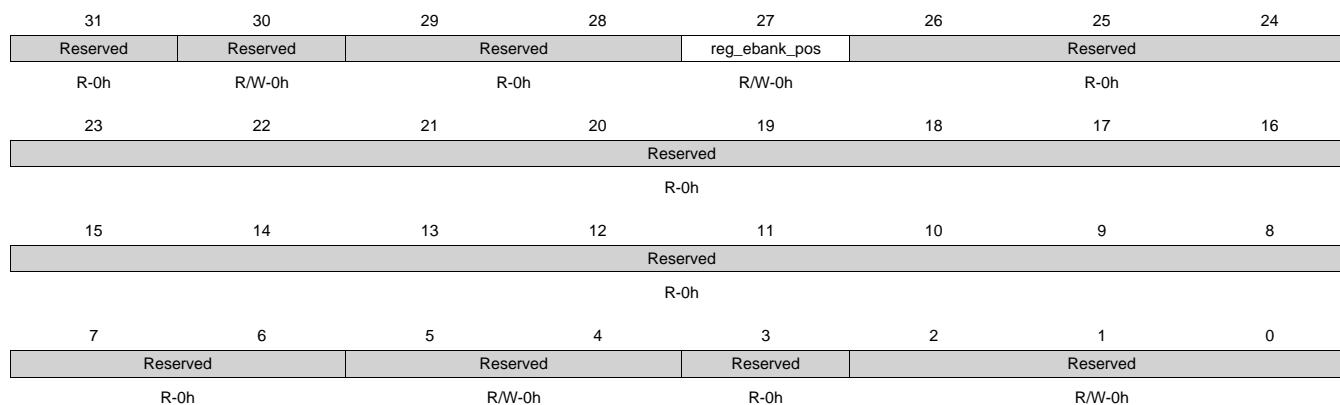

**Table 7-113. SDRAM\_CONFIG Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
15-14	reg_narrow_mode	R/W	0h	SDRAM data bus width. Set to 0 for 32-bit and set to 1 for 16-bit. All other values are reserved.
13-10	reg_cl	R/W	0h	CAS Latency. The value of this field defines the CAS latency to be used when accessing connected SDRAM devices. Value of 2, 3, 5, and 6 (CAS latency of 2, 3, 1.5, and 2.5) are supported for DDR1. Value of 2, 3, 4, and 5 (CAS latency of 2, 3, 4, and 5) are supported for DDR2. Value of 2, 4, 6, 8, 10, 12, and 14 (CAS latency of 5, 6, 7, 8, 9, 10, and 11) are supported for DDR3. Value of 2 and 3 (CAS latency of 2 and 3) are supported for LPDDR1. All other values are reserved.
9-7	reg_rowsize	R/W	0h	Row Size. Defines the number of row address bits of connected SDRAM devices. Set to 0 for 9 row bits, set to 1 for 10 row bits, set to 2 for 11 row bits, set to 3 for 12 row bits, set to 4 for 13 row bits, set to 5 for 14 row bits, set to 6 for 15 row bits, and set to 7 for 16 row bits. This field is only used when reg_ibank_pos field in SDRAM Config register is set to 1, 2, or 3, or reg_ebank_pos field in SDRAM Config_2 register is set to 1.
6-4	reg_ibank	R/W	0h	Internal Bank setup. Defines number of banks inside connected SDRAM devices. Set to 0 for 1 bank, set to 1 for 2 banks, set to 2 for 4 banks, and set to 3 for 8 banks. All other values are reserved.
3	reg_ebank	R/W	0h	External chip select setup. Defines whether SDRAM accesses will use 1 or 2 chip select lines. Set to 0 to use pad_cs_o_n[0] only. All other values reserved.
2-0	reg_pagesize	R/W	0h	Page Size. Defines the internal page size of connected SDRAM devices. Set to 0 for 256-word page (8 column bits), set to 1 for 512-word page (9 column bits), set to 2 for 1024-word page (10 column bits), and set to 3 for 2048-word page (11 column bits). All other values are reserved.

### 7.3.5.4 SDRAM\_CONFIG\_2 Register (offset = Ch) [reset = 0h]

SDRAM\_CONFIG\_2 is shown in [Figure 7-94](#) and described in [Table 7-114](#).

**Figure 7-94. SDRAM\_CONFIG\_2 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-114. SDRAM\_CONFIG\_2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	Reserved	R	0h	
30	Reserved	R/W	0h	Reserved.
29-28	Reserved	R	0h	
27	reg_ebank_pos	R/W	0h	External bank position. Set to 0 to assign external bank address bits from lower OCP address, as shown in the tables for OCP Address to DDR2/3/mDDR Address Mapping. Set to 1 to assign external bank address bits from higher OCP address bits, as shown in the tables for OCP Address to DDR2/3/mDDR Address Mapping.
26-6	Reserved	R	0h	
5-4	Reserved	R/W	0h	Reserved.
3	Reserved	R	0h	
2-0	Reserved	R/W	0h	Reserved.

### 7.3.5.5 SDRAM\_REF\_CTRL Register (offset = 10h) [reset = 0h]

SDRAM\_REF\_CTRL is shown in [Figure 7-95](#) and described in [Table 7-115](#).

**Figure 7-95. SDRAM\_REF\_CTRL Register**

31	30	29	28	27	26	25	24
reg_initref_dis	Reserved	reg_srt	reg_asr	Reserved	reg_pasr		
R/W-0h	R-0h	R/W-0h	R/W-0h	R-0h	R/W-0h		
23	22	21	20	19	18	17	16
Reserved							
R-0h							
15	14	13	12	11	10	9	8
reg_refresh_rate							
R/W-0h							
7	6	5	4	3	2	1	0
reg_refresh_rate							
R/W-0h							

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

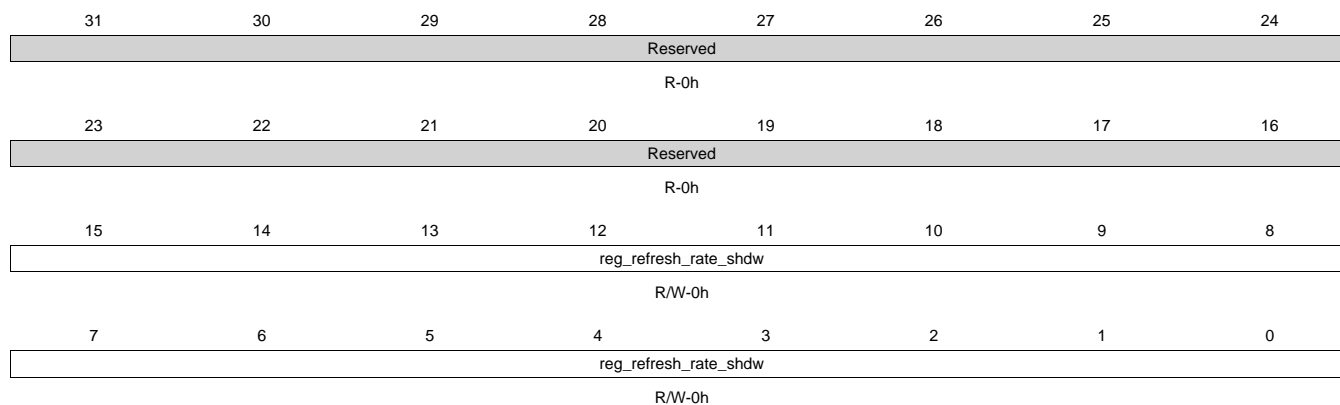

**Table 7-115. SDRAM\_REF\_CTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	reg_initref_dis	R/W	0h	Initialization and Refresh disable. When set to 1, EMIF will disable SDRAM initialization and refreshes, but will carry out SDRAM write/read transactions.
30	Reserved	R	0h	
29	reg_srt	R/W	0h	DDR3 Self Refresh temperature range. Set to 0 for normal operating temperature range and set to 1 for extended operating temperature range when the reg_asr field is set to 0. This bit must be set to 0 if the reg_asr field is set to 1. A write to this field will cause the EMIF to start the SDRAM initialization sequence.
28	reg_asr	R/W	0h	DDR3 Auto Self Refresh enable. Set to 1 for auto Self Refresh enable. Set to 0 for manual Self Refresh reference indicated by the reg_srt field. A write to this field will cause the EMIF to start the SDRAM initialization sequence.
27	Reserved	R	0h	
26-24	reg_pasr	R/W	0h	Partial Array Self Refresh. These bits get loaded into the Extended Mode Register of an LPDDR1 or DDR3 during initialization. For LPDDR1, set to 0 for full array, set to 1 for 1/2 array, set to 2 for 1/4 array, set to 5 for 1/8 array, and set to 6 for 1/16 array to be refreshed. For DDR3, set to 0 for full array, set to 1 or 5 for 1/2 array, set to 2 or 6 for 1/4 array, set to 3 or 7 for 1/8 array, and set to 4 for 3/4 array to be refreshed. All other values are reserved. A write to this field will cause the EMIF to start the SDRAM initialization sequence.
23-16	Reserved	R	0h	
15-0	reg_refresh_rate	R/W	0h	Refresh Rate. Value in this field is used to define the rate at which connected SDRAM devices will be refreshed. SDRAM refresh rate = EMIF rate / reg_refresh_rate where EMIF rate is equal to DDR clock rate. If $reg\_refresh\_rate < (8 * reg\_t\_rfc) + reg\_t\_rp + reg\_t\_rcd + 20$ then it will be loaded with $(8 * reg\_t\_rfc) + reg\_t\_rp + reg\_t\_rcd + 20$ . This is done to avoid lock-up situations when illegal values are programmed.

### 7.3.5.6 SDRAM\_REF\_CTRL\_SHDW Register (offset = 14h) [reset = 0h]

SDRAM\_REF\_CTRL\_SHDW is shown in [Figure 7-96](#) and described in [Table 7-116](#).

**Figure 7-96. SDRAM\_REF\_CTRL\_SHDW Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-116. SDRAM\_REF\_CTRL\_SHDW Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	Reserved	R	0h	
15-0	reg_refresh_rate_shdw	R/W	0h	Shadow field for reg_refresh_rate. This field is loaded into reg_refresh_rate field in SDRAM Refresh Control register when SideAck is asserted. This register is not auto corrected when the value is invalid.

### 7.3.5.7 SDRAM\_TIM\_1 Register (offset = 18h) [reset = 0h]

SDRAM\_TIM\_1 is shown in [Figure 7-97](#) and described in [Table 7-117](#).

**Figure 7-97. SDRAM\_TIM\_1 Register**

31	30	29	28	27	26	25	24
Reserved			reg_t_rp			reg_t_rcd

R/W-0h				R/W-0h			
7	6	5	4	3	2	1	0
reg_t_rc		reg_t_rrd			reg_t_wtr		
R/W-0h		R/W-0h			R/W-0h		

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

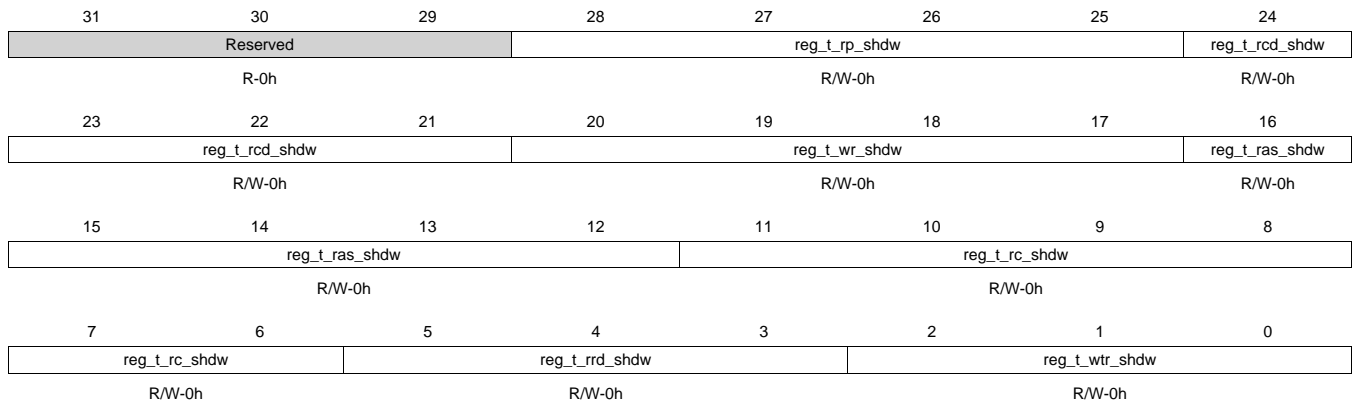

**Table 7-117. SDRAM\_TIM\_1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-29	Reserved	R	0h	
28-25	reg_t_rp	R/W	0h	Minimum number of DDR clock cycles from Precharge to Activate or Refresh, minus one.
24-21	reg_t_rcd	R/W	0h	Minimum number of DDR clock cycles from Activate to Read or Write, minus one.
20-17	reg_t_wr	R/W	0h	Minimum number of DDR clock cycles from last Write transfer to Pre-charge, minus one. The SDRAM initialization sequence will be started when the value of this field is changed from the previous value and the EMIF is in DDR2 mode.
16-12	reg_t_ras	R/W	0h	Minimum number of DDR clock cycles from Activate to Pre-charge, minus one. $reg\_t\_ras \geq reg\_t\_rcd$ .
11-6	reg_t_rc	R/W	0h	Minimum number of DDR clock cycles from Activate to Activate, minus one.
5-3	reg_t_rrd	R/W	0h	Minimum number of DDR clock cycles from Activate to Activate for a different bank, minus one. For an 8-bank DDR2 and DDR3, this field must be equal to $((tFAW)/(4*tCK))-1$ .
2-0	reg_t_wtr	R/W	0h	Minimum number of DDR clock cycles from last Write to Read, minus one.

### 7.3.5.8 SDRAM\_TIM\_1\_SHDW Register (offset = 1Ch) [reset = 0h]

SDRAM\_TIM\_1\_SHDW is shown in [Figure 7-98](#) and described in [Table 7-118](#).

**Figure 7-98. SDRAM\_TIM\_1\_SHDW Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-118. SDRAM\_TIM\_1\_SHDW Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-29	Reserved	R	0h	
28-25	reg_t_rp_shdw	R/W	0h	Shadow field for reg_t_rp. This field is loaded into reg_t_rp field in SDRAM Timing 1 register when SldleAck is asserted.
24-21	reg_t_rcd_shdw	R/W	0h	Shadow field for reg_t_rcd. This field is loaded into reg_t_rcd field in SDRAM Timing 1 register when SldleAck is asserted.
20-17	reg_t_wr_shdw	R/W	0h	Shadow field for reg_t_wr. This field is loaded into reg_t_wr field in SDRAM Timing 1 register when SldleAck is asserted. initialization sequence will be started when the value of this field is changed from the previous value and the EMIF is in DDR2 mode.
16-12	reg_t_ras_shdw	R/W	0h	Shadow field for reg_t_ras. This field is loaded into reg_t_ras field in SDRAM Timing 1 register when SldleAck is asserted.
11-6	reg_t_rc_shdw	R/W	0h	Shadow field for reg_t_rc. This field is loaded into reg_t_rc field in SDRAM Timing 1 register when SldleAck is asserted.
5-3	reg_t_rrd_shdw	R/W	0h	Shadow field for reg_t_rrd. This field is loaded into reg_t_rrd field in SDRAM Timing 1 register when SldleAck is asserted.
2-0	reg_t_wtr_shdw	R/W	0h	Shadow field for reg_t_wtr. This field is loaded into reg_t_wtr field in SDRAM Timing 1 register when SldleAck is asserted.

### 7.3.5.9 SDRAM\_TIM\_2 Register (offset = 20h) [reset = 0h]

SDRAM\_TIM\_2 is shown in [Figure 7-99](#) and described in [Table 7-119](#).

**Figure 7-99. SDRAM\_TIM\_2 Register**

31	30	29	28	27	26	25	24

R/W-0h		R/W-0h			R/W-0h		

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

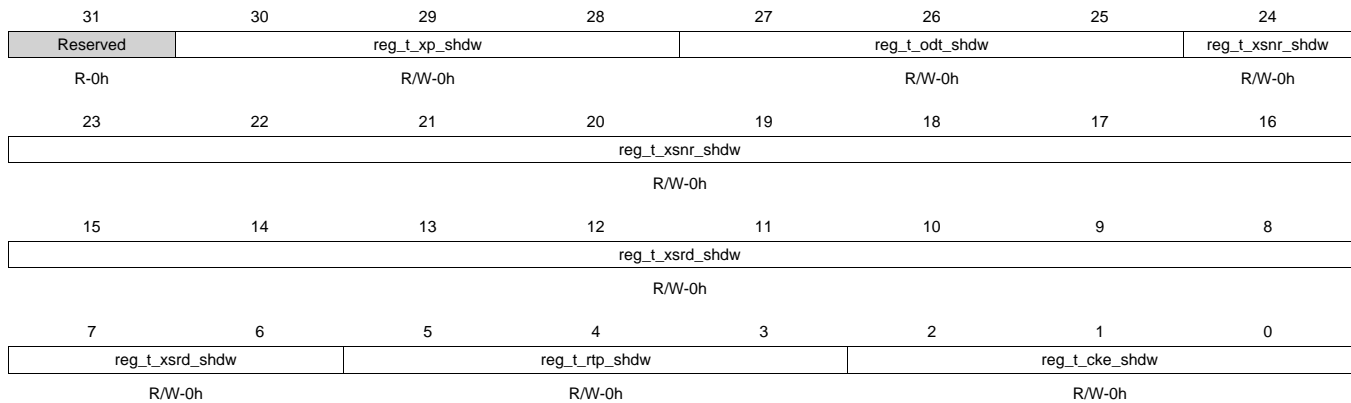

**Table 7-119. SDRAM\_TIM\_2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	Reserved	R	0h	
30-28	reg_t_xp	R/W	0h	Minimum number of DDR clock cycles from Powerdown exit to any command other than a Read command, minus one. For DDR2 and LPDDR1, this field must satisfy greater of tXP or tCKE.
27-25	reg_t_odt	R/W	0h	Minimum number of DDR clock cycles from ODT enable to write data driven for DDR2 and DDR3. reg_t_odt must be equal to tAOND.
24-16	reg_t_xsnr	R/W	0h	Minimum number of DDR clock cycles from Self-Refresh exit to any command other than a Read command, minus one.
15-6	reg_t_xsrd	R/W	0h	Minimum number of DDR clock cycles from Self-Refresh exit to a Read command, minus one.
5-3	reg_t_rtp	R/W	0h	Minimum number of DDR clock cycles from the last Read command to a Pre-charge command for DDR2 and DDR3, minus one.
2-0	reg_t_cke	R/W	0h	Minimum number of DDR clock cycles between pad_cke_o changes, minus one.

### 7.3.5.10 SDRAM\_TIM\_2\_SHDW Register (offset = 24h) [reset = 0h]

SDRAM\_TIM\_2\_SHDW is shown in [Figure 7-100](#) and described in [Table 7-120](#).

**Figure 7-100. SDRAM\_TIM\_2\_SHDW Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-120. SDRAM\_TIM\_2\_SHDW Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	Reserved	R	0h	
30-28	reg_t_xp_shdw	R/W	0h	Shadow field for reg_t_xp. This field is loaded into reg_t_xp field in SDRAM Timing 2 register when SldleAck is asserted.
27-25	reg_t_odt_shdw	R/W	0h	Shadow field for reg_t_odt. This field is loaded into reg_t_odt field in SDRAM Timing 2 register when SldleAck is asserted.
24-16	reg_t_xsnr_shdw	R/W	0h	Shadow field for reg_t_xsnr. This field is loaded into reg_t_xsnr field in SDRAM Timing 2 register when SldleAck is asserted.
15-6	reg_t_xsrdd_shdw	R/W	0h	Shadow field for reg_t_xsrdd. This field is loaded into reg_t_xsrdd field in SDRAM Timing 2 register when SldleAck is asserted.
5-3	reg_t_rtp_shdw	R/W	0h	Shadow field for reg_t_rtp. This field is loaded into reg_t_rtp field in SDRAM Timing 2 register when SldleAck is asserted.
2-0	reg_t_cke_shdw	R/W	0h	Shadow field for reg_t_cke. This field is loaded into reg_t_cke field in SDRAM Timing 2 register when SldleAck is asserted.

### 7.3.5.11 SDRAM\_TIM\_3 Register (offset = 28h) [reset = 0h]

SDRAM\_TIM\_3 is shown in [Figure 7-101](#) and described in [Table 7-121](#).

**Figure 7-101. SDRAM\_TIM\_3 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-121. SDRAM\_TIM\_3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-28	reg_t_pdll_ul	R/W	0h	Minimum number of DDR clock cycles for PHY DLL to unlock. A value of N will be equal to N x 128 clocks.
27-24	Reserved	R	0h	
23-21	Reserved	R/W	0h	Reserved.
20-15	reg_zq_zqcs	R/W	0h	Number of DDR clock cycles for a ZQCS command, minus one.
14-13	Reserved	R/W	0h	Reserved.
12-4	reg_t_rfc	R/W	0h	Minimum number of DDR clock cycles from Refresh or Load Mode to Refresh or Activate, minus one.
3-0	reg_t_ras_max	R/W	0h	Maximum number of reg_refresh_rate intervals from Activate to Precharge command. This field must be equal to ((tRASmax / tREFI)-1) rounded down to the next lower integer. This field is only applicable for mDDR. This field must be programmed to 0xF for other SDRAM types.

### 7.3.5.12 SDRAM\_TIM\_3\_SHDW Register (offset = 2Ch) [reset = 0h]

SDRAM\_TIM\_3\_SHDW is shown in [Figure 7-102](#) and described in [Table 7-122](#).

**Figure 7-102. SDRAM\_TIM\_3\_SHDW Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

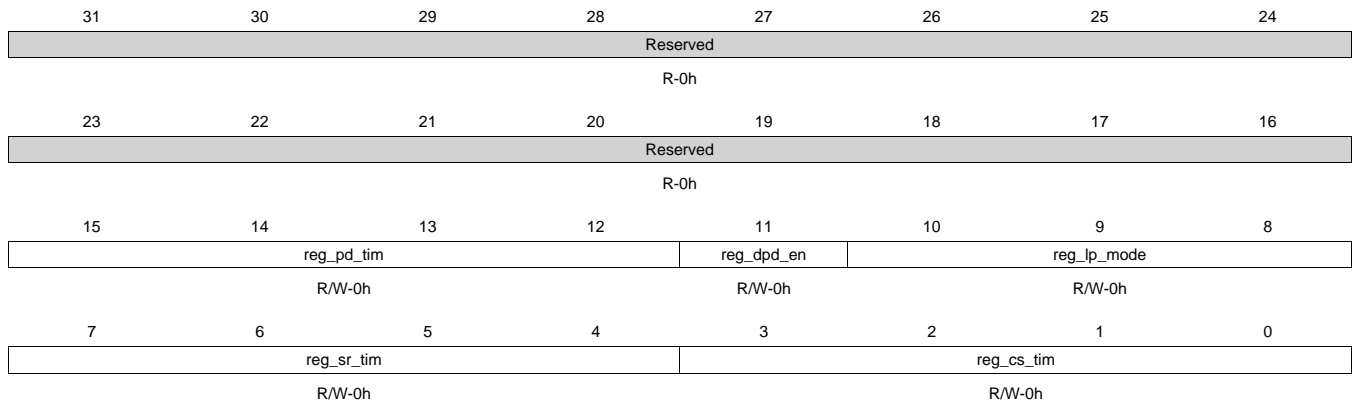

**Table 7-122. SDRAM\_TIM\_3\_SHDW Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-28	reg_t_pdll_ul_shdw	R/W	0h	Shadow field for reg_t_pdll_ul. This field is loaded into reg_t_pdll_ul field in SDRAM Timing 3 register when SldleAck is asserted.
27-24	Reserved	R	0h	
23-21	Reserved	R/W	0h	Reserved.
20-15	reg_zq_zqcs_shdw	R/W	0h	Shadow field for reg_zq_zqcs. This field is loaded into reg_zq_zqcs field in SDRAM Timing 3 register when SldleAck is asserted.
14-13	Reserved	R/W	0h	Reserved.
12-4	reg_t_rfc_shdw	R/W	0h	Shadow field for reg_t_rfc. This field is loaded into reg_t_rfc field in SDRAM Timing 3 register when SldleAck is asserted.
3-0	reg_t_ras_max_shdw	R/W	0h	Shadow field for reg_t_ras_max. This field is loaded into reg_t_ras_max field in SDRAM Timing 3 register when SldleAck is asserted.

### 7.3.5.13 PWR\_MGMT\_CTRL Register (offset = 38h) [reset = 0h]

PWR\_MGMT\_CTRL is shown in [Figure 7-103](#) and described in [Table 7-123](#).

**Figure 7-103. PWR\_MGMT\_CTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-123. PWR\_MGMT\_CTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	Reserved	R	0h	
15-12	reg_pd_tim	R/W	0h	Power Management timer for Power-Down. The EMIF will put the external SDRAM in Power-Down mode after the EMIF is idle for these number of DDR clock cycles and if reg_lp_mode field is set to 4. Set to 0 to immediately enter Power-Down mode. Set to 1 for 16 clocks. Set to 2 for 32 clocks. Set to 3 for 64 clocks. Set to 4 for 128 clocks. Set to 5 for 256 clocks. Set to 6 for 512 clocks. Set to 7 for 1024 clocks. Set to 8 for 2048 clocks. Set to 9 for 4096 clocks. Set to 10 for 8192 clocks. Set to 11 for 16384 clocks. Set to 12 for 32768 clocks. Set to 13 for 65536 clocks. Set to 14 for 131072 clocks. Set to 15 for 262144 clocks. Note: After updating this field, at least one dummy read access to SDRAM is required for the new value to take affect.
11	reg_dpd_en	R/W	0h	Deep Power Down enable. Set to 0 for normal operation. Set to 1 to enter deep power down mode. This mode will override the reg_lp_mode field setting.
10-8	reg_lp_mode	R/W	0h	Automatic Power Management enable. Set to 1 for Clock Stop, set to 2 for Self Refresh, and set to 4 for Power-Down. All other values will disable automatic power management.

**Table 7-123. PWR\_MGMT\_CTRL Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
7-4	reg_sr_tim	R/W	0h	<p>Power Management timer for Self Refresh. The EMIF will put the external SDRAM in Self Refresh mode after the EMIF is idle for these number of DDR clock cycles and if reg_lp_mode field is set to 2. Set to 0 to immediately enter Self Refresh mode. Set to 1 for 16 clocks. Set to 2 for 32 clocks. Set to 3 for 64 clocks. Set to 4 for 128 clocks. Set to 5 for 256 clocks. Set to 6 for 512 clocks. Set to 7 for 1024 clocks. Set to 8 for 2048 clocks. Set to 9 for 4096 clocks. Set to 10 for 8192 clocks. Set to 11 for 16384 clocks. Set to 12 for 32768 clocks. Set to 13 for 65536 clocks. Set to 14 for 131072 clocks. Set to 15 for 262144 clocks. Note: After updating this field, at least one dummy read access to SDRAM is required for the new value to take affect.</p>
3-0	reg_cs_tim	R/W	0h	<p>Power Management timer for Clock Stop. The EMIF will put the external SDRAM in Clock Stop mode after the EMIF is idle for these number of DDR clock cycles and if reg_lp_mode field is set to 1. Set to 0 to immediately enter Clock Stop mode. Set to 1 for 16 clocks. Set to 2 for 32 clocks. Set to 3 for 64 clocks. Set to 4 for 128 clocks. Set to 5 for 256 clocks. Set to 6 for 512 clocks. Set to 7 for 1024 clocks. Set to 8 for 2048 clocks. Set to 9 for 4096 clocks. Set to 10 for 8192 clocks. Set to 11 for 16384 clocks. Set to 12 for 32768 clocks. Set to 13 for 65536 clocks. Set to 14 for 131072 clocks. Set to 15 for 262144 clocks. Note: After updating this field, at least one dummy read access to SDRAM is required for the new value to take affect.</p>

### 7.3.5.14 PWR\_MGMT\_CTRL\_SHDW Register (offset = 3Ch) [reset = 0h]

PWR\_MGMT\_CTRL\_SHDW is shown in [Figure 7-104](#) and described in [Table 7-124](#).

**Figure 7-104. PWR\_MGMT\_CTRL\_SHDW Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-124. PWR\_MGMT\_CTRL\_SHDW Register Field Descriptions**

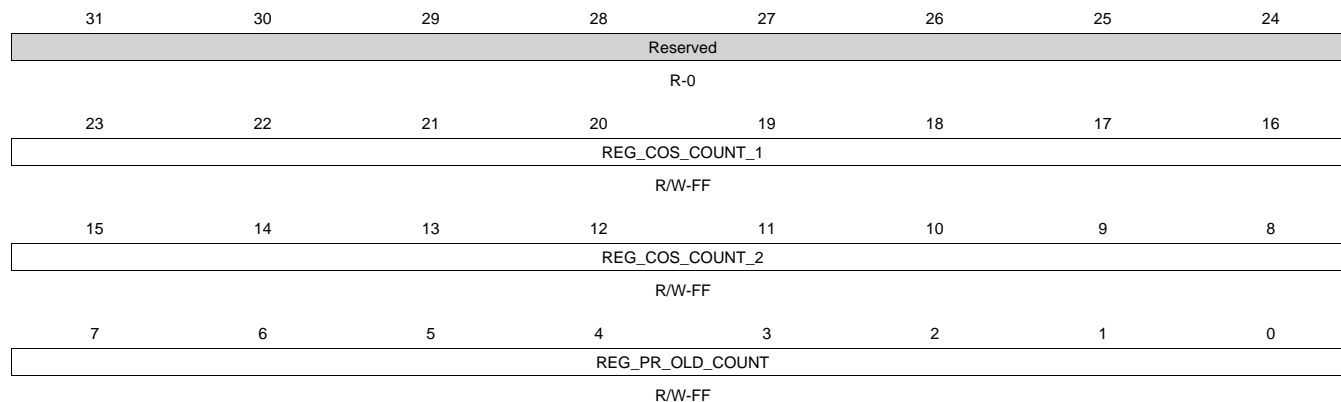

Bit	Field	Type	Reset	Description
31-12	Reserved	R	0h	
11-8	reg_pd_tim_shdw	R/W	0h	Shadow field for reg_pd_tim. This field is loaded into reg_pd_tim field in Power Management Control register when SldeAck is asserted.
7-4	reg_sr_tim_shdw	R/W	0h	Shadow field for reg_sr_tim. This field is loaded into reg_sr_tim field in Power Management Control register when SldeAck is asserted.
3-0	reg_cs_tim_shdw	R/W	0h	Shadow field for reg_cs_tim. This field is loaded into reg_cs_tim field in Power Management Control register when SldeAck is asserted.

### 7.3.5.15 INT\_CONFIG Register (offset = 54h) [reset = 0h]

Interface Configuration Register

Interface Configuration Register is shown in [Figure 7-105](#) and described in [Table 7-125](#).

**Figure 7-105. Interface Configuration Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-125. Interface Configuration Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	Reserved	R	R	Reserved for future use.
23-16	REG_COS_COUNT_1	R/W	0xFF	Priority Raise Counter for class of service 1. Number of m_clk cycles after which the EMIF momentarily raises the priority of the class of service 1 commands in the Command FIFO. A value of N will be equal to N x 16 clocks.
15-8	REG_COS_COUNT_2	R/W	0xFF	Priority Raise Counter for class of service 2. Number of m_clk cycles after which the EMIF momentarily raises the priority of the class of service 2 commands in the Command FIFO. A value of N will be equal to N x 16 clocks.
7-0	REG_PR_OLD_COUNT	R/W	0xFF	Priority Raise Old Counter. Number of m_clk cycles after which the EMIF momentarily raises the priority of the oldest command in the OCP Command FIFO. A value of N will be equal to N x 16 clocks.

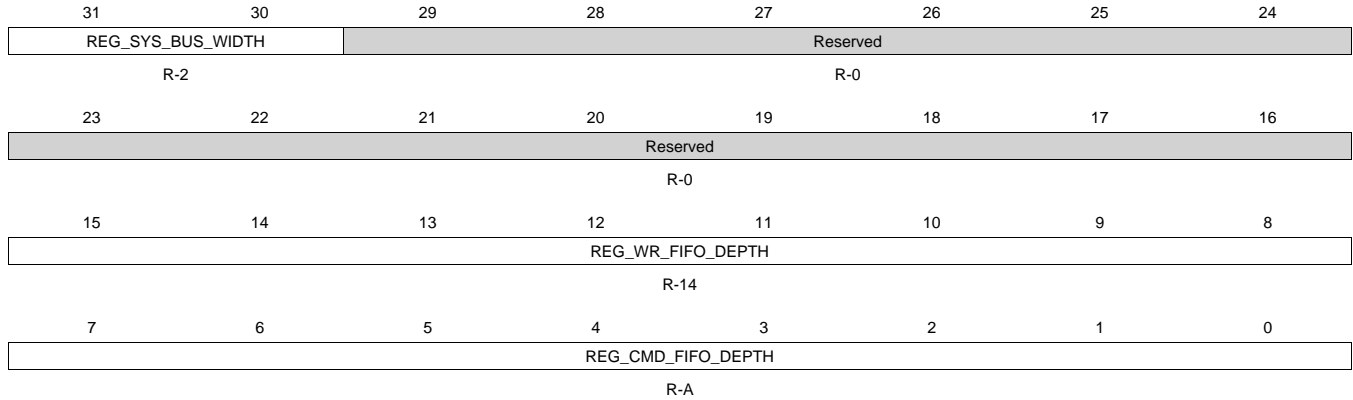

### 7.3.5.16 INT\_CFG\_VAL\_1 Register (offset = 58h) [reset = 0h]

Interface Configuration Value 1 Register

Interface Configuration Value 1 Register is shown in [Figure 7-106](#) and described in [Table 7-126](#).

**Figure 7-106. Interface Configuration Value 1 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-126. Interface Configuration Value 1 Register Field Descriptions**

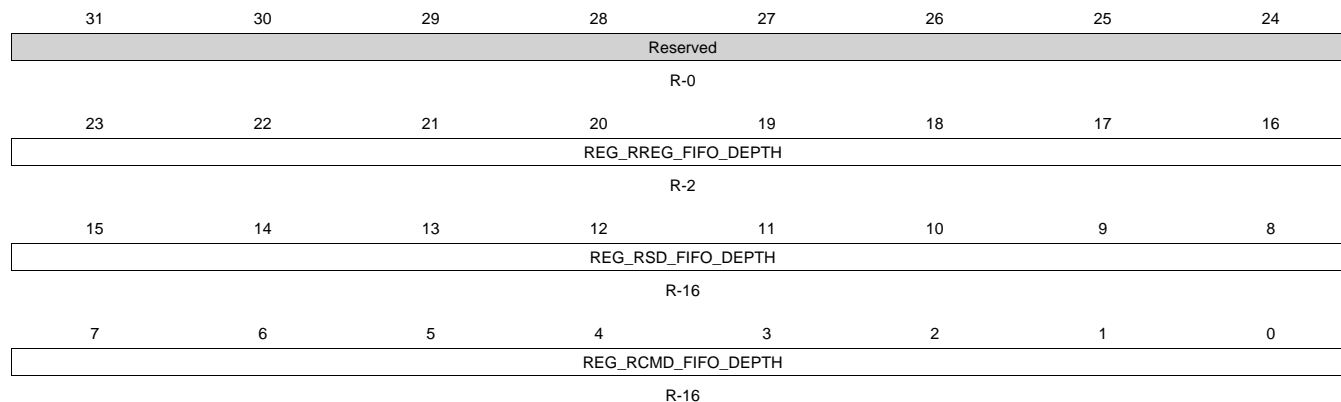

Bit	Field	Type	Reset	Description
31-30	REG_SYS_BUS_WIDTH	R	2	L3 OCP data bus width for a particular configuration. 0 = 32 bit wide. 1 = 64 bit wide. 2 = 128 bit wide. 3 = 256 bit wide.
29-16	Reserved	R	0	Reserved for future use.
15-8	REG_WR_FIFO_DEPTH	R	0x14	Write Data FIFO depth for a particular configuration.
7-0	REG_CMD_FIFO_DEPTH	R	0xA	Command FIFO depth for a particular configuration.

### 7.3.5.17 INT\_CFG\_VAL\_2 Register (offset = 5Ch) [reset = 0h]

Interface Configuration Value 2 Register

Interface Configuration Value 2 Register is shown in [Figure 7-107](#) and described in [Table 7-127](#).

**Figure 7-107. Interface Configuration Value 2 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-127. Interface Configuration Value 2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	Reserved	R	0	Reserved for future use.
23-16	REG_RREG_FIFO_DEPTH	R	0x2	Register Read Data FIFO depth for a particular configuration.
15-8	REG_RSD_FIFO_DEPTH	R	0x16	SDRAM Read Data FIFO depth for a particular configuration.
7-0	REG_RCMD_FIFO_DEPTH	R	0x16	Read Command FIFO depth for a particular configuration.

### 7.3.5.18 PERF\_CNT\_1 Register (offset = 80h) [reset = 0h]

PERF\_CNT\_1 is shown in [Figure 7-108](#) and described in [Table 7-128](#).

**Figure 7-108. PERF\_CNT\_1 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-128. PERF\_CNT\_1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	reg_counter1	R	0h	32-bit counter that can be configured as specified in the Performance Counter Config Register and Performance Counter Master Region Select Register.

### 7.3.5.19 PERF\_CNT\_2 Register (offset = 84h) [reset = 0h]

PERF\_CNT\_2 is shown in [Figure 7-109](#) and described in [Table 7-129](#).

**Figure 7-109. PERF\_CNT\_2 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-129. PERF\_CNT\_2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	reg_counter2	R	0h	32-bit counter that can be configured as specified in the Performance Counter Config Register and Performance Counter Master Region Select Register.

### 7.3.5.20 PERF\_CNT\_CFG Register (offset = 88h) [reset = 10000h]

PERF\_CNT\_CFG is shown in [Figure 7-110](#) and described in [Table 7-130](#).

**Figure 7-110. PERF\_CNT\_CFG Register**

31	30	29	28	27	26	25	24
reg_cntr2_mconnid_en	reg_cntr2_region_en	Reserved					
R/W-0h	R/W-0h	R-0h					
23	22	21	20	19	18	17	16
Reserved				reg_cntr2_cfg			
R-0h				R/W-1h			
15	14	13	12	11	10	9	8
reg_cntr1_mconnid_en	reg_cntr1_region_en	Reserved					
R/W-0h	R/W-0h	R-0h					
7	6	5	4	3	2	1	0
Reserved				reg_cntr1_cfg			
R-0h				R/W-0h			

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

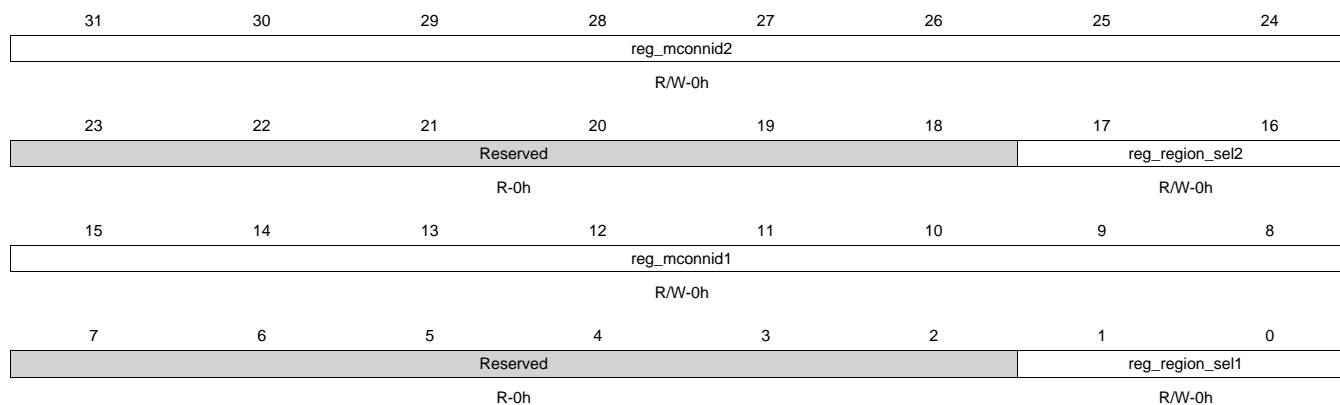

**Table 7-130. PERF\_CNT\_CFG Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	reg_cntr2_mconnid_en	R/W	0h	MConnID filter enable for Performance Counter 2 register.
30	reg_cntr2_region_en	R/W	0h	Chip Select filter enable for Performance Counter 2 register.
29-20	Reserved	R	0h	
19-16	reg_cntr2_cfg	R/W	1h	Filter configuration for Performance Counter 2. For details, see the table titled "Filter Configurations for Performance Counters".
15	reg_cntr1_mconnid_en	R/W	0h	MConnID filter enable for Performance Counter 1 register.
14	reg_cntr1_region_en	R/W	0h	Chip Select filter enable for Performance Counter 1 register.
13-4	Reserved	R	0h	
3-0	reg_cntr1_cfg	R/W	0h	Filter configuration for Performance Counter 1. For details, see the table titled "Filter Configurations for Performance Counters".

### 7.3.5.21 PERF\_CNT\_SEL Register (offset = 8Ch) [reset = 0h]

PERF\_CNT\_SEL is shown in [Figure 7-111](#) and described in [Table 7-131](#).

**Figure 7-111. PERF\_CNT\_SEL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-131. PERF\_CNT\_SEL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	reg_mconnid2	R/W	0h	MConnID for Performance Counter 2 register.
23-18	Reserved	R	0h	
17-16	reg_region_sel2	R/W	0h	MAddrSpace for Performance Counter 2 register.
15-8	reg_mconnid1	R/W	0h	MConnID for Performance Counter 1 register.
7-2	Reserved	R	0h	
1-0	reg_region_sel1	R/W	0h	MAddrSpace for Performance Counter 1 register.

**7.3.5.22 PERF\_CNT\_TIM Register (offset = 90h) [reset = 0h]**

PERF\_CNT\_TIM is shown in [Figure 7-112](#) and described in [Table 7-132](#).

**Figure 7-112. PERF\_CNT\_TIM Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-132. PERF\_CNT\_TIM Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	reg_total_time	R	0h	32-bit counter that continuously counts number for m_clk cycles elapsed after EMIF is brought out of reset.

### 7.3.5.23 READ\_IDLE\_CTRL Register (offset = 98h) [reset = 50000h]

READ\_IDLE\_CTRL is shown in [Figure 7-113](#) and described in [Table 7-133](#).

**Figure 7-113. READ\_IDLE\_CTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-133. READ\_IDLE\_CTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-20	Reserved	R	0h	
19-16	reg_read_idle_len	R/W	5h	The Read Idle Length field determines the minimum size (reg_read_idle_len-1 clock cycles) of Read Idle window for the read idle detection as well as the force read idle time.
15-9	Reserved	R	0h	
8-0	reg_read_idle_interval	R/W	0h	The Read Idle Interval field determines the maximum interval ((reg_read_idle_interval-1)*64 clock cycles) between read idle detections or force. A value of zero disables the read idle function.

### 7.3.5.24 READ\_IDLE\_CTRL\_SHDW Register (offset = 9Ch) [reset = 5000h]

READ\_IDLE\_CTRL\_SHDW is shown in [Figure 7-114](#) and described in [Table 7-134](#).

**Figure 7-114. READ\_IDLE\_CTRL\_SHDW Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-134. READ\_IDLE\_CTRL\_SHDW Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-20	Reserved	R	0h	
19-16	reg_read_idle_len_shdw	R/W	5h	Shadow field for reg_read_idle_len. This field is loaded into reg_read_idle_len field in Read Idle Control register when SideAck is asserted
15-9	Reserved	R	0h	
8-0	reg_read_idle_interval_shdw	R/W	0h	Shadow field for reg_read_idle_interval. This field is loaded into reg_read_idle_interval field in Read Idle Control register when SideAck is asserted.

### 7.3.5.25 IRQSTATUS\_RAW\_SYS Register (offset = A4h) [reset = 0h]

IRQSTATUS\_RAW\_SYS is shown in [Figure 7-115](#) and described in [Table 7-135](#).

**Figure 7-115. IRQSTATUS\_RAW\_SYS Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-135. IRQSTATUS\_RAW\_SYS Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2	Reserved	R/W	0h	Reserved.
1	reg_ta_sys	R/W	0h	Raw status of system OCP interrupt. Write 1 to set the (raw) status, mostly for debug. Writing a 0 has no effect.
0	reg_err_sys	R/W	0h	Raw status of system OCP interrupt. Write 1 to set the (raw) status, mostly for debug. Writing a 0 has no effect.

### 7.3.5.26 IRQSTATUS\_SYS Register (offset = ACh) [reset = 0h]

IRQSTATUS\_SYS is shown in [Figure 7-116](#) and described in [Table 7-136](#).

**Figure 7-116. IRQSTATUS\_SYS Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-136. IRQSTATUS\_SYS Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2	Reserved	R/W	0h	Reserved.
1	reg_ta_sys	R/W	0h	Enabled status of system OCP interrupt. Write 1 to clear the status after interrupt has been serviced (raw status gets cleared, i.e. even if not enabled). Writing a 0 has no effect.
0	reg_err_sys	R/W	0h	Enabled status of system OCP interrupt. Write 1 to clear the status after interrupt has been serviced (raw status gets cleared, i.e. even if not enabled). Writing a 0 has no effect.

### 7.3.5.27 IRQENABLE\_SET\_SYS Register (offset = B4h) [reset = 0h]

IRQENABLE\_SET\_SYS is shown in [Figure 7-117](#) and described in [Table 7-137](#).

**Figure 7-117. IRQENABLE\_SET\_SYS Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-137. IRQENABLE\_SET\_SYS Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2	Reserved	R/W	0h	Reserved.
1	reg_en_ta_sys	R/W	0h	Enable set for system OCP interrupt. Writing a 1 will enable the interrupt, and set this bit as well as the corresponding Interrupt Enable Clear Register. Writing a 0 has no effect.
0	reg_en_err_sys	R/W	0h	Enable set for system OCP interrupt. Writing a 1 will enable the interrupt, and set this bit as well as the corresponding Interrupt Enable Clear Register. Writing a 0 has no effect.

**7.3.5.28 IRQENABLE\_CLR\_SYS Register (offset = BCh) [reset = 0h]**

 IRQENABLE\_CLR\_SYS is shown in [Figure 7-118](#) and described in [Table 7-138](#).

**Figure 7-118. IRQENABLE\_CLR\_SYS Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-138. IRQENABLE\_CLR\_SYS Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2	Reserved	R/W	0h	Reserved.
1	reg_en_ta_sys	R/W	0h	Enable clear for system OCP interrupt. Writing a 1 will disable the interrupt, and clear this bit as well as the corresponding Interrupt Enable Set Register. Writing a 0 has no effect.
0	reg_en_err_sys	R/W	0h	Enable clear for system OCP interrupt. Writing a 1 will disable the interrupt, and clear this bit as well as the corresponding Interrupt Enable Set Register. Writing a 0 has no effect.

### 7.3.5.29 ZQ\_CONFIG Register (offset = C8h) [reset = 0h]

ZQ\_CONFIG is shown in [Figure 7-119](#) and described in [Table 7-139](#).

**Figure 7-119. ZQ\_CONFIG Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-139. ZQ\_CONFIG Register Field Descriptions**

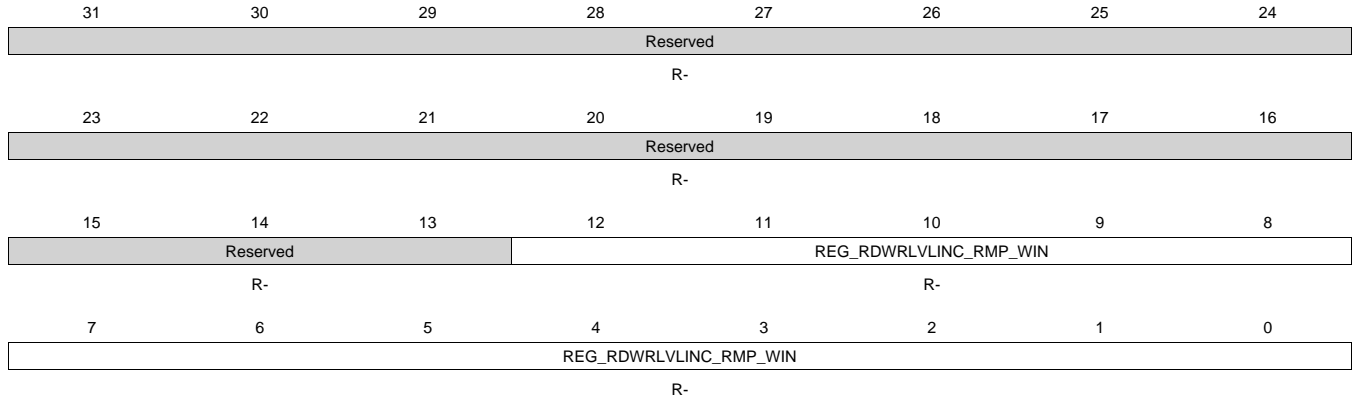

Bit	Field	Type	Reset	Description
31	reg_zq_cs1en	R/W	0h	Writing a 1 enables ZQ calibration for CS1.
30	reg_zq_cs0en	R/W	0h	Writing a 1 enables ZQ calibration for CS0.
29	reg_zq_dualcalen	R/W	0h	ZQ Dual Calibration enable. Allows both ranks to be ZQ calibrated simultaneously. Setting this bit requires both chip selects to have a seerate calibration resistor per device.
28	reg_zq_sfexiten	R/W	0h	ZQCL on Self Refresh, Active Power-Down, and Precharge Power-Down exit enable. Writing a 1 enables the issuing of ZQCL on Self-Refresh, Active Power-Down, and Precharge Power-Down exit.
27-20	Reserved	R	0h	
19-18	reg_zq_zqinit_mult	R/W	0h	Indicates the number of ZQCL intervals that make up a ZQINIT interval, minus one.
17-16	reg_zq_zqcl_mult	R/W	0h	Indicates the number of ZQCS intervals that make up a ZQCL interval, minus one. ZQCS interval is defined by reg_zq_zqcs in SDRAM Timing 3 Register.
15-0	reg_zq_refinterval	R/W	0h	Number of refresh periods between ZQCS commans. This field supports between one refresh period to 256 ms between ZQCS calibration commands. Refresh period is defined by reg_refresh_rate in SDRAM Refresh Control register.

**7.3.5.30 RDWR\_LVL\_RMP\_WIN Register (offset = D4h) [reset = 0h]**

Read-Write Leveling Ramp Window Register

Read-Write Leveling Ramp Window Register is shown in [Figure 7-120](#) and described in [Table 7-140](#).

**Figure 7-120. Read-Write Leveling Ramp Window Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-140. Read-Write Leveling Ramp Window Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-13	Reserved	R		Reserved.
12-0	REG_RDWRLVLINC_RMP_WIN	R		Incremental leveling ramp window in number of refresh periods. The value programmed is minus one the required value. Refresh period is defined by reg_refresh_rate in SDRAM Refresh Control register.

### 7.3.5.31 RDWR\_LVL\_RMP\_CTRL Register (offset = D8h) [reset = 0h]

Read-Write Leveling Ramp Control Register

Read-Write Leveling Ramp Control Register is shown in [Figure 7-121](#) and described in [Table 7-141](#).

**Figure 7-121. Read-Write Leveling Ramp Control Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-141. Read-Write Leveling Ramp Control Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	REG_RDWRLVL_EN	R/W		Read-Write Leveling enable. Set 1 to enable leveling. Set 0 to disable leveling.
30-24	REG_RDWRLVLINC_RMP_PRE			Incremental leveling pre-scalar in number of refresh periods during ramp window. The value programmed is minus one the required value. Refresh period is defined by reg_refresh_rate in SDRAM Refresh Control register.
23-16	REG_RDLVLINC_RMP_INT	R/W		Incremental read data eye training interval during ramp window. Number of reg_rdwrvlinc_rmp_pre intervals between incremental read data eye training. A value of 0 will disable incremental read data eye training during ramp window.
15-8	REG_RDLVLGATEINC_RMP_INT	R/W		Incremental read DQS gate training interval during ramp window. Number of reg_rdwrvlinc_rmp_pre intervals between incremental read DQS gate training. A value of 0 will disable incremental read DQS gate training during ramp window.
7-0	REG_WRLVLINC_RMP_INT			Incremental write leveling interval during ramp window. Number of reg_rdwrvlinc_rmp_pre intervals between incremental write leveling. A value of 0 will disable incremental write leveling during ramp window.

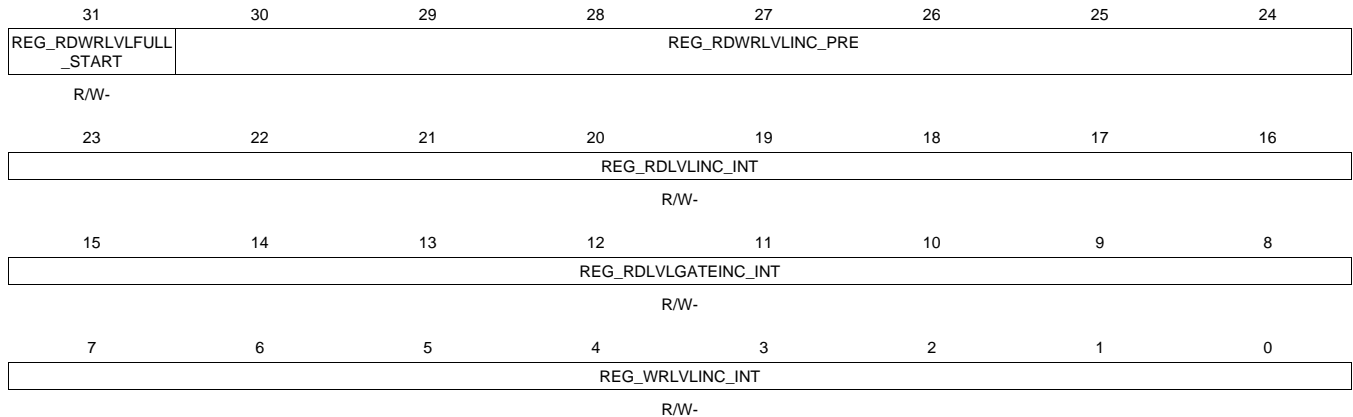

### 7.3.5.32 RDWR\_LVL\_CTRL Register (offset = DCh) [reset = 0h]

Read-Write Leveling Control Register

Read-Write Leveling Control Register is shown in [Figure 7-122](#) and described in [Table 7-142](#).

Read-Write Leveling Control Register

**Figure 7-122. Read-Write Leveling Control Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-142. Read-Write Leveling Control Register Field Descriptions**

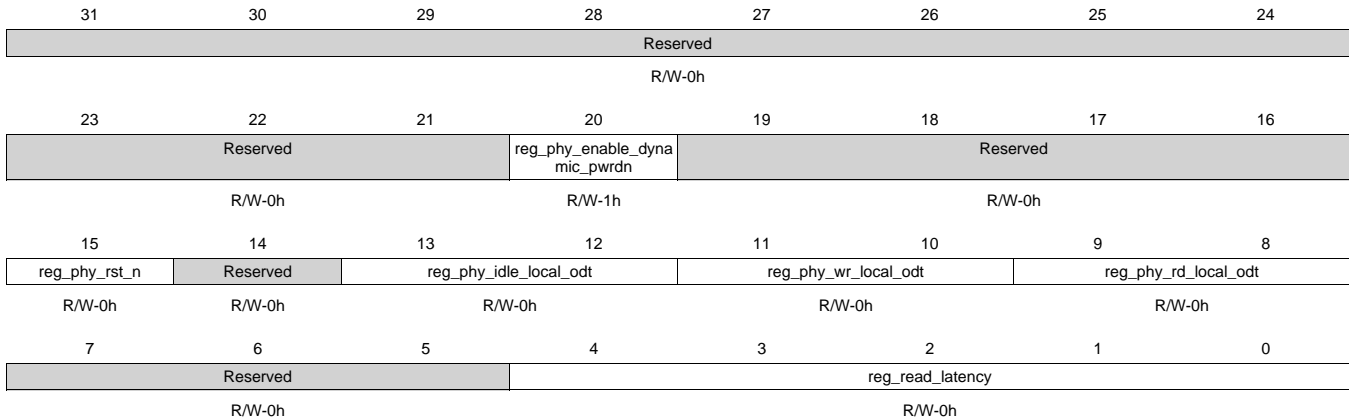

Bit	Field	Type	Reset	Description
31	REG_RDWRLVLFULL_START	R/W		Full leveling trigger. Writing a 1 to this field triggers full read and write leveling. This bit will self-clear to 0.
30-24	REG_RDWRLVLINC_PRE			Incremental leveling pre-scalar in number of refresh periods. The value programmed is minus one the required value. Refresh period is defined by reg_refresh_rate in SDRAM Refresh Control register.
23-16	REG_RDLVLINC_INT	R/W		Incremental read data eye training interval. Number of reg_rdwrlvlinc_pre intervals between incremental read data eye training. A value of 0 will disable incremental read data eye training.
15-8	REG_RDLVLGATEINC_INT	R/W		Incremental read DQS gate training interval. Number of reg_rdwrlvlinc_pre intervals between incremental read DQS gate training. A value of 0 will disable incremental read DQS gate training.
7-0	REG_WRLVLINC_INT	R/W		Incremental write leveling interval. Number of reg_rdwrlvlinc_pre intervals between incremental write leveling. A value of 0 will disable incremental write leveling.

### 7.3.5.33 DDR\_PHY\_CTRL\_1 Register (offset = E4h) [reset = 0h]

DDR\_PHY\_CTRL\_1 is shown in Figure 7-123 and described in Table 7-143.

A write to the DDR PHY Control 1 register must be followed by a write to the SDRAM\_CONFIG register to ensure that the control update/acknowledge protocol is performed on the DID. If CAS latency = 5, the minimum read latency = 5 + 2 = 7 and reg\_read\_latency must be programmed as 7 - 1 = 6. The maximum read latency = 5 + 7 = 12 and reg\_read\_latency must be programmed as 12 - 1 = 11.

**Figure 7-123. DDR\_PHY\_CTRL\_1 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-143. DDR\_PHY\_CTRL\_1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-21	Reserved	R/W	0h	Reserved.
20	reg_phy_enable_dynamic_pwrdn	R/W	1h	Dynamically enables powering down the IO receiver when not performing a read. 0 = IO receivers always powered up. 1 = IO receivers only powered up during a read.
19-16	Reserved	R/W	0h	Reserved.
15	reg_phy_rst_n	R/W	0h	Writing a 1 to this bit will hold the PHY macros in reset. Writing a 0 will bring PHY macros out of reset.
14	Reserved	R/W	0h	Reserved.
13-12	reg_phy_idle_local_odt	R/W	0h	Value to drive on the 2-bit local_odt (On-Die Termination) PHY outputs when reg_phy_dynamic_pwrdn_enable is asserted and a read is not in progress and reg_phy_dynamic_pwrdn_enable. Typically this is the value required to disable termination (00) to save power when idle.
11-10	reg_phy_wr_local_odt	R/W	0h	This bit controls the value assigned to the reg_phy_wr_local_odt input on the data macros. Always set to 00.
9-8	reg_phy_rd_local_odt	R/W	0h	Value to drive on the 2-bit local_odt (On-Die Termination) PHY outputs when output enable is not asserted and a read is in progress (where in progress is defined as after a read command is issued and until all read data has been returned all the way to the controller.) Typically this is set to the value required to enable termination at the desired strength for read usage. 00 = ODT off. 01 = ODT off. 10 = Full thevenin load. Effective ODT is equivalent to 1x the output driver impedance setting in DDR_DATAx_IOCTRL.io_config_i register bits. 11 = Half thevenin load. Effective ODT is equivalent to 2x the output driver impedance setting in DDR_DATAx_IOCTRL.io_config_i register bits.
7-5	Reserved	R/W	0h	Reserved.

**Table 7-143. DDR\_PHY\_CTRL\_1 Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
4-0	reg_read_latency	R/W	0h	This field defines the latency for read data from DDR SDRAM in number of DDR clock cycles. The value applied should be equal to the required value minus one. The maximum read latency supported by the DDR PHY is equal to CAS latency plus 7 clock cycles. The minimum read latency must be equal to CAS latency plus 2 clock cycle.

### 7.3.5.34 DDR\_PHY\_CTRL\_1\_SHDW Register (offset = E8h) [reset = 0h]

DDR\_PHY\_CTRL\_1\_SHDW is shown in [Figure 7-124](#) and described in [Table 7-144](#).

A write to the DDR PHY Control 1 register must be followed by a write to the SDRAM\_CONFIG register to ensure that the control update/acknowledge protocol is performed on the DID. If CAS latency = 5, the minimum read latency = 5 + 2 = 7 and reg\_read\_latency must be programmed as 7 - 1 = 6. The maximum read latency = 5 + 7 = 12 and reg\_read\_latency must be programmed as 12 - 1 = 11.

**Figure 7-124. DDR\_PHY\_CTRL\_1\_SHDW Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-144. DDR\_PHY\_CTRL\_1\_SHDW Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-21	Reserved	R/W	0h	Reserved.
20	reg_phy_enable_dynamic_pwrdn	R/W	1h	Dynamically enables powering down the IO receiver when not performing a read. 0 = IO receivers always powered up. 1 = IO receivers only powered up during a read.
19-16	Reserved	R/W	0h	Reserved.
15	reg_phy_rst_n	R/W	0h	Writing a 1 to this bit will hold the PHY macros in reset. Writing a 0 will bring PHY macros out of reset.
14	Reserved	R/W	0h	Reserved.
13-12	reg_phy_idle_local_odt	R/W	0h	Value to drive on the 2-bit local_odt PHY outputs when reg_phy_dynamic_pwrdn_enable is asserted and a read is not in progress and reg_phy_dynamic_pwrdn_enable. Typically this is the value required to disable termination (00) to save power when idle.
11-10	reg_phy_wr_local_odt	R/W	0h	This bit controls the value assigned to the reg_phy_wr_local_odt input on the data macros. Always set to 00.
9-8	reg_phy_rd_local_odt	R/W	0h	Value to drive on the 2-bit local_odt PHY outputs when output enable is not asserted and a read is in progress (where in progress is defined as after a read command is issued and until all read data has been returned all the way to the controller.) Typically this is set to the value required to enable termination at the desired strength for read usage. 00 = ODT off. 01 = ODT off. 10 = Full thevenin load. 11 = Half thevenin load.
7-5	Reserved	R/W	0h	Reserved.

**Table 7-144. DDR\_PHY\_CTRL\_1\_SHDW Register Field Descriptions (continued)**

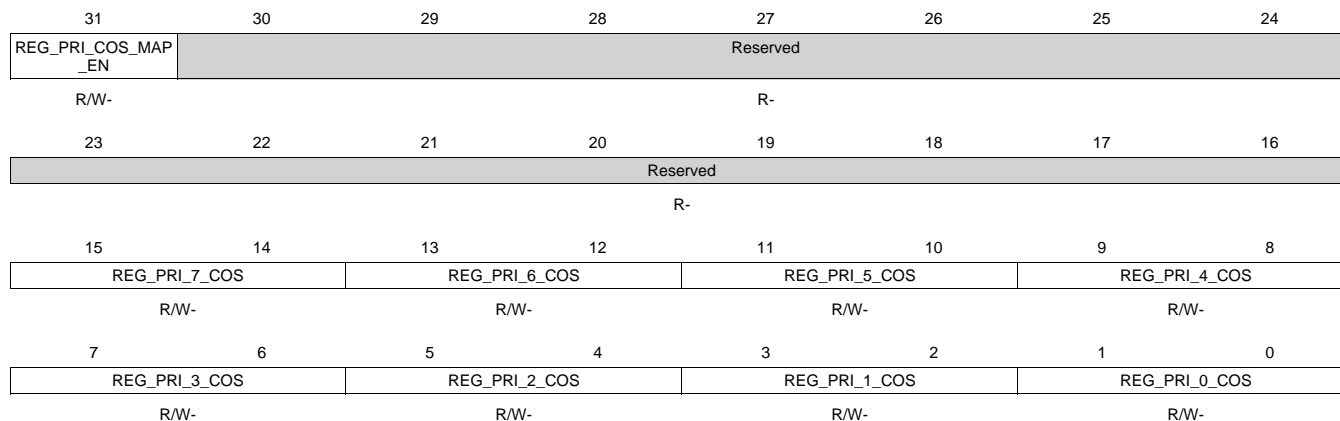

Bit	Field	Type	Reset	Description
4-0	reg_read_latency	R/W	0h	This field defines the latency for read data from DDR SDRAM in number of DDR clock cycles. The value applied should be equal to the required value minus one. The maximum read latency supported by the DDR PHY is equal to CAS latency plus 7 clock cycles. The minimum read latency must be equal to CAS latency plus 2 clock cycle.

### 7.3.5.35 PRI\_COS\_MAP Register (offset = 100h) [reset = 0h]

Priority to Class of Service Mapping Register

Priority to Class of Service Mapping Register is shown in [Figure 7-125](#) and described in [Table 7-145](#).

**Figure 7-125. Priority to Class of Service Mapping Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-145. Priority to Class of Service Mapping Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	REG_PRI_COS_MAP_EN	R/W		Set 1 to enable priority to class of service mapping. Set 0 to disable mapping.
30-16	Reserved	R		Reserved.
15-14	REG_PRI_7_COS	R/W		Class of service for commands with priority of 7. Value can be 1 or 2. Setting a value of 0 or 3 will not assign any class of service.
13-12	REG_PRI_6_COS	R/W		Class of service for commands with priority of 6. Value can be 1 or 2. Setting a value of 0 or 3 will not assign any class of service.
11-10	REG_PRI_5_COS	R/W		Class of service for commands with priority of 5. Value can be 1 or 2. Setting a value of 0 or 3 will not assign any class of service.
9-8	REG_PRI_4_COS	R/W		Class of service for commands with priority of 4. Value can be 1 or 2. Setting a value of 0 or 3 will not assign any class of service.
7-6	REG_PRI_3_COS	R/W		Class of service for commands with priority of 3. Value can be 1 or 2. Setting a value of 0 or 3 will not assign any class of service.
5-4	REG_PRI_2_COS	R/W		Class of service for commands with priority of 2. Value can be 1 or 2. Setting a value of 0 or 3 will not assign any class of service.
3-2	REG_PRI_1_COS	R/W		Class of service for commands with priority of 1. Value can be 1 or 2. Setting a value of 0 or 3 will not assign any class of service.
1-0	REG_PRI_0_COS	R/W		Class of service for commands with priority of 0. Value can be 1 or 2. Setting a value of 0 or 3 will not assign any class of service.

### 7.3.5.36 CONNID\_COS\_1\_MAP Register (offset = 104h) [reset = 0h]

Connection ID to Class of Service 1 Mapping Register

Connection ID to Class of Service 1 Mapping Register is shown in [Figure 7-126](#) and described in [Table 7-146](#).

**Figure 7-126. Connection ID to Class of Service 1 Mapping Register**

31	30	29	28	27	26	25	24

1-0	REG_MSK_3_COS_2	R/W		Mask for connection ID. Value 3 for class of service 2. 0 = disable masking. 1 = mask connection ID bit 0. 2 = mask connection ID bits 1:0. 3 = mask connection ID bits 2:0.

### 7.3.5.38 RD\_WR\_EXEC\_THRSH Register (offset = 120h) [reset = 0h]

Read Write Execution Threshold Register

Read Write Execution Threshold Register is shown in [Figure 7-128](#) and described in [Table 7-148](#).

**Figure 7-128. Read Write Execution Threshold Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-148. Read Write Execution Threshold Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-13	Reserved	R		Reserved.
12-8	REG_WR_THRSH	R/W		Write Threshold. Number of SDRAM write bursts after which the EMIF arbitration will switch to executing read commands. The value programmed is always minus one the required number.
7-5	Reserved	R		Reserved.
4-0	REG_RD_THRSH	R/W		Read Threshold. Number of SDRAM read bursts after which the EMIF arbitration will switch to executing write commands. The value programmed is always minus one the required number.

### 7.3.6 DDR2/3/mDDR PHY Registers

Table 7-149 lists the memory-mapped registers for the DDR2/3 mDDR PHY. Configure the DDR PHY Control Register for calibration of board delay and other parameters to get the SDRAM device working at a different speed.

Note: These registers are write-only due to a silicon bug. The contents of these registers cannot be read.

**Table 7-149. Memory-Mapped Registers for DDR2/3/mDDR PHY**

Register Name	Type	Register	Register	Address
		Description	Reset	Offset
CMD0_REG_PHY_CTRL_SLAVE_RATIO_0	W	DDR PHY Command 0 Address/Command Slave Ratio Register	0x80	0x01C
CMD0_REG_PHY_DLL_LOCK_DIFF_0	W	DDR PHY Command 0 Address/Command DLL Lock Difference Register	0x4	0x028

### 7.3.6.1 DDR PHY Command 0/1/2 Address/Command Slave Ratio Register (CMD0/1/2\_REG\_PHY\_CTRL\_SLAVE\_RATIO\_0)

The DDR PHY Command 0/1/2 Address/Command Slave Ratio Register (CMD0/1/2\_REG\_PHY\_CTRL\_SLAVE\_RATIO\_0) is shown in the figure and table below.

**Figure 7-129. DDR PHY Command 0/1/2 Address/Command Slave Ratio Register  
(CMD0/1/2\_REG\_PHY\_CTRL\_SLAVE\_RATIO\_0)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-150. DDR PHY Command 0/1/2 Address/Command Slave Ratio Register  
(CMD0/1/2\_REG\_PHY\_CTRL\_SLAVE\_RATIO\_0) Field Descriptions**

Bit	Field	Value	Description
31-10	Reserved		Reserved
9-0	CMD_SLAVE_RATIO	0-80h	Ratio value for address/command launch timing in DDR PHY macro. This is the fraction of a clock cycle represented by the shift to be applied to the read DQS in units of 256ths. In other words, the full-cycle tap value from the master DLL will be scaled by this number over 256 to get the delay value for the slave delay line.

### 7.3.6.2 DDR PHY Command 0/1/2 Address/Command DLL Lock Difference Register (CMD0/1/2\_REG\_PHY\_DLL\_LOCK\_DIFF\_0)

The DDR PHY Command 0/1/2 Address/Command DLL Lock Difference Register (CMD0/1/2\_REG\_PHY\_DLL\_LOCK\_DIFF\_0) is shown in the figure and table below.

**Figure 7-130. DDR PHY Command 0/1/2 Address/Command DLL Lock Difference Register  
(CMD0/1/2\_REG\_PHY\_DLL\_LOCK\_DIFF\_0)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-151. DDR PHY Command 0/1/2 Address/Command DLL Lock Difference Register  
(CMD0/1/2\_REG\_PHY\_DLL\_LOCK\_DIFF\_0) Field Descriptions**

Bit	Field	Value	Description
31-4	Reserved		Reserved
3-0	DLL_LOCK_DIFF	0-4h	The max number of delay line taps variation allowed while maintaining the master DLL lock. This is calculated as total jitter/ delay line tap size, where total jitter is half of (incoming clock jitter (pp) + delay line jitter (pp)).

### 7.3.6.3 DDR PHY Command 0/1/2 Invert Clockout Selection Register( CMD0/1/2\_REG\_PHY\_INVERT\_CLKOUT\_0)

The CDDR PHY Command 0/1/2 Invert Clockout Selection Register(  
CMD0/1/2\_REG\_PHY\_INVERT\_CLKOUT\_0) is shown in the figure and table below.

**Figure 7-131. DDR PHY Command 0/1/2 Invert Clockout Selection Register(  
CMD0/1/2\_REG\_PHY\_INVERT\_CLKOUT\_0)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-152. DDR PHY Command 0/1/2 Invert Clockout Selection Register(  
CMD0/1/2\_REG\_PHY\_INVERT\_CLKOUT\_0) Field Descriptions**

Bit	Field	Value	Description
31-1	Reserved	0	Reserved
0	INVERT_CLK_SEL	0	Inverts the polarity of DRAM clock. Core clock is passed on to DRAM
		1	inverted core clock is passed on to DRAM

### 7.3.6.4 DDR PHY Data Macro 0/1 Read DQS Slave Ratio Register (DATA0/1\_REG\_PHY\_RD\_DQS\_SLAVE\_RATIO\_0)

The DDR PHY Data Macro 0/1 Read DQS Slave Ratio  
Register(DATA0/1\_REG\_PHY\_RD\_DQS\_SLAVE\_RATIO\_0) is shown in the figure and table below.

**Figure 7-132. DDR PHY Data Macro 0/1 Read DQS Slave Ratio Register  
(DATA0/1\_REG\_PHY\_RD\_DQS\_SLAVE\_RATIO\_0)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-153. DDR PHY Data Macro 0/1 Read DQS Slave Ratio Register  
(DATA0/1\_REG\_PHY\_RD\_DQS\_SLAVE\_RATIO\_0) Field Descriptions**

Bit	Field	Value	Description
31-20	Reserved		Reserved
19-10	Reserved	0h	Reserved
9-0	RD_DQS_SLAVE_RATIO_CS0	40h	Ratio value for Read DQS slave DLL for CS0. This is the fraction of a clock cycle represented by the shift to be applied to the read DQS in units of 256ths. In other words, the full-cycle tap value from the master DLL will be scaled by this number over 256 to get the delay value for the slave delay line.

**7.3.6.5 DDR PHY Data Macro 0/1 Write DQS Slave Ratio Register (DATA0/1\_REG\_PHY\_WR\_DQS\_SLAVE\_RATIO\_0)**

The DDR PHY Data Macro 0/1 Write DQS Slave Ratio Register(DATA0/1\_REG\_PHY\_WR\_DQS\_SLAVE\_RATIO\_0) is shown in the figure and table below.

**Table 7-154. DDR PHY Data Macro 0/1 Write DQS Slave Ratio Register (DATA0/1\_REG\_PHY\_WR\_DQS\_SLAVE\_RATIO\_0)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-155. DDR PHY Data Macro 0/1 Write DQS Slave Ratio Register (DATA0/1\_REG\_PHY\_WR\_DQS\_SLAVE\_RATIO\_0) Field Descriptions**

Bit	Field	Value	Description
31-20	Reserved	0	Reserved
19-10	Reserved		Reserved
9-0	WR_DQS_SLAVE_RATIO_CS0		Ratio value for Write DQS slave DLL for CS0. This is the fraction of a clock cycle represented by the shift to be applied to the write DQS in units of 256ths. In other words, the full-cycle tap value from the master DLL will be scaled by this number over 256 to get the delay value for the slave delay line.

**7.3.6.6 DDR PHY Data Macro 0/1 Write Leveling Init Ratio Register (DATA0/1\_REG\_PHY\_WRLVL\_INIT\_RATIO\_0)**

The DDR PHY Data Macro 0/1 Write Leveling Init Ratio Register (DATA0/1\_REG\_PHY\_WRLVL\_INIT\_RATIO\_0) is shown in the figure and table below.

**Figure 7-133. DDR PHY Data Macro 0/1 Write Leveling Init Ratio Register (DATA0/1\_REG\_PHY\_WRLVL\_INIT\_RATIO\_0)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-156. DDR PHY Data Macro 0/1 Write Leveling Init Ratio Register (DATA0/1\_REG\_PHY\_WRLVL\_INIT\_RATIO\_0) Field Descriptions**

Bit	Field	Value	Description
31-20	Reserved	0	Reserved
19-10	Reserved	0h	Reserved
9-0	WRLVL_INIT_RATIO_CS0	0h	The user programmable init ratio used by Write Leveling FSM when DATA0/1_REG_PHY_WRLVL_INIT_MODE_0 register value set to 1

### 7.3.6.7 DDR PHY Data Macro 0 Write Leveling Init Mode Ratio Selection Register (DATA0/1\_REG\_PHY\_WRLVL\_INIT\_MODE\_0)

The DDR PHY Data Macro 0 Write Leveling Init Mode Ratio Selection Register (DATA0/1\_REG\_PHY\_WRLVL\_INIT\_MODE\_0) is shown in the figure and table below.

**Figure 7-134. DDR PHY Data Macro 0 Write Leveling Init Mode Ratio Selection Register (DATA0/1\_REG\_PHY\_WRLVL\_INIT\_MODE\_0)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-157. DDR PHY Data Macro 0 Write Leveling Init Mode Ratio Selection Register (DATA0/1\_REG\_PHY\_WRLVL\_INIT\_MODE\_0)**

Bit	Field	Value	Description
31-1	Reserved	0	Reserved
0	WRLVL_INIT_MODE_SEL	0	The user programmable init ratio selection mode for Write Leveling FSM. Selects a starting ratio value based on Write Leveling of previous data slice.
		1	Selects a starting ratio value based in register DATA0/1_REG_PHY_WRLVL_INIT_RATIO_0 value programmed by the user.

### 7.3.6.8 DDR PHY Data Macro 0 DQS Gate Training Init Ratio Register (DATA0\_REG\_PHY\_GATELVL\_INIT\_RATIO\_0)

The DDR PHY Data Macro 0 DQS Gate Training Init Ratio Register (DATA0\_REG\_PHY\_GATELVL\_INIT\_RATIO\_0) is shown in the figure and table below.

**Figure 7-135. DDR PHY Data Macro 0 DQS Gate Training Init Ratio Register (DATA0\_REG\_PHY\_GATELVL\_INIT\_RATIO\_0)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-158. DDR PHY Data Macro 0 DQS Gate Training Init Ratio Register (DATA0\_REG\_PHY\_GATELVL\_INIT\_RATIO\_0) Field Descriptions**

Bit	Field	Value	Description
31-20	Reserved		Reserved
19-10	Reserved	0h	Reserved
9-0	GATELVL_INIT_RATIO_CS0	0h	The user programmable init ratio used by DQS Gate Training FSM when DATA0/1_REG_PHY_GATELVL_INIT_MODE_0 register value set to 1.

**7.3.6.9 DDR PHY Data Macro 0/1 DQS Gate Training Init Mode Ratio Selection Register (DATA0/1\_REG\_PHY\_GATELVL\_INIT\_MODE\_0)**

The DDR PHY Data Macro 0/1 DQS Gate Training Init Mode Ratio Selection Register(DATA0/1\_REG\_PHY\_GATELVL\_INIT\_MODE\_0) is shown in the figure and table below.

**Figure 7-136. DDR PHY Data Macro 0/1 DQS Gate Training Init Mode Ratio Selection Register (DATA0/1\_REG\_PHY\_GATELVL\_INIT\_MODE\_0)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-159. DDR PHY Data Macro 0/1 DQS Gate Training Init Mode Ratio Selection Register (DATA0/1\_REG\_PHY\_GATELVL\_INIT\_MODE\_0) Field Descriptions**

Bit	Field	Value	Description
31-1	Reserved	0	Reserved
0	GATELVL_INIT_MODE_SEL	0 1	User programmable init ratio selection mode for DQS Gate Training FSM. Selects a starting ratio value based on Write Leveling of the same data slice. selects a starting ratio value based on DATA0/1_REG_PHY_GATELVL_INIT_RATIO_0 value programmed by the user.

**7.3.6.10 DDR PHY Data Macro 0/1 DQS Gate Slave Ratio Register (DATA0/1\_REG\_PHY\_FIFO\_WE\_SLAVE\_RATIO\_0)**

The DDR PHY Data Macro 0/1 DQS Gate Slave Ratio Register (DATA0/1\_REG\_PHY\_FIFO\_WE\_SLAVE\_RATIO\_0) is shown in the figure and table below.

**Figure 7-137. DDR PHY Data Macro 0/1 DQS Gate Slave Ratio Register (DATA0/1\_REG\_PHY\_FIFO\_WE\_SLAVE\_RATIO\_0)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-160. DDR PHY Data Macro 0/1 DQS Gate Slave Ratio Register (DATA0/1\_REG\_PHY\_FIFO\_WE\_SLAVE\_RATIO\_0) Field Descriptions**

Bit	Field	Value	Description
31-20	Reserved	0	Reserved
19-10	Reserved	0h	Reserved
9-0	RD_DQS_GATE_SLAVE_RATIO_CS0	0h	Ratio value for fifo we for CS0.

### 7.3.6.11 DDR PHY Data Macro 0/1 Write Data Slave Ratio Register (DATA0/1\_REG\_PHY\_WR\_DATA\_SLAVE\_RATIO\_0)

The DDR PHY Data Macro 0/1 Write Data Slave Ratio Register (DATA0/1\_REG\_PHY\_WR\_DATA\_SLAVE\_RATIO\_0) is shown in the figure and table below.

**Figure 7-138. DDR PHY Data Macro 0/1 Write Data Slave Ratio Register  
(DATA0/1\_REG\_PHY\_WR\_DATA\_SLAVE\_RATIO\_0)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-161. DDR PHY Data Macro 0/1 Write Data Slave Ratio Register  
(DATA0/1\_REG\_PHY\_WR\_DATA\_SLAVE\_RATIO\_0) Field Descriptions**

Bit	Field	Value	Description
31-20	Reserved	40h	Reserved
19-10	Reserved	0	
9-0	WR_DATA_SLAVE_RATIO_CS0	40h	Ratio value for write data slave DLL for CS0.  This is the fraction of a clock cycle represented by the shift to be applied to the write DQ muxes in units of 256ths. In other words, the full-cycle tap value from the master DLL will be scaled by this number over 256 to get the delay value for the slave delay line.

### 7.3.6.12 DDR PHY Data Macro 0/1 Delay Selection Register (DATA0/1\_REG\_PHY\_USE\_RANK0\_DELAYS)

The DATA0/1\_REG\_PHY\_USE\_RANK0\_DELAYS is shown in [Figure 7-139](#) and described in [Table 7-162](#).

**Figure 7-139. DDR PHY Data Macro 0/1 Delay Selection Register (DATA0/1\_REG\_PHY\_USE\_RANK0\_DELAYS)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-162. DDR PHY Data Macro 0/1 Delay Selection Register (DATA0/1\_REG\_PHY\_USE\_RANK0\_DELAYS) Field Descriptions**

Bit	Field	Value	Description
31-1	Reserved	0	Reserved
0	PHY_USE_RANK0_DELAYS_0	0	Delay Selection Each Rank uses its own delay. (Recommended). This is applicable only in case of DDR3
		1	Rank 0 delays are used for all ranks. This must be set to 1 for DDR2 and mDDR.

## 7.4 ELM

### 7.4.1 Introduction

Non-managed NAND flash memories can be dense and nonvolatile in their own nature, but error-prone. When reading from NAND flash memories, some level of error-correction is required. In the case of NAND modules with no internal correction capability, sometimes referred to as bare NANDs, the correction process is delegated to the memory controller.

The general-purpose memory controller (GPMC) probes data read from an external NAND flash and uses this to compute checksum-like information, called syndrome polynomials, on a per-block basis. Each syndrome polynomial gives a status of the read operations for a full block, including 512 bytes of data, parity bits, and an optional spare-area data field, with a maximum block size of 1023 bytes. Computation is based on a Bose-Chaudhuri-Hocquenghem (BCH) algorithm. The error-location module (ELM) extracts error addresses from these syndrome polynomials.

Based on the syndrome polynomial value, the ELM can detect errors, compute the number of errors, and give the location of each error bit. The actual data is not required to complete the error-correction algorithm. Errors can be reported anywhere in the NAND flash block, including in the parity bits.

The maximum acceptable number of errors that can be corrected depends on a programmable configuration parameter. 4-, 8-, and 16-bit error-correction levels are supported. The ELM relies on a static and fixed definition of the generator polynomial for each error-correction level that corresponds to the generator polynomials defined in the GPMC (there are three fixed polynomials for the three correction error levels). A larger number of errors than the programmed error-correction level may be detected, but the ELM cannot correct them all. The offending block is then tagged as uncorrectable in the associated computation exit status register. If the computation is successful, that is, if the number of errors detected does not exceed the maximum value authorized for the chosen correction capability, the exit status register contains the information on the number of detected errors.

When the error-location process completes, an interrupt is triggered to inform the central processing unit (CPU) that its status can be checked. The number of detected errors and their locations in the NAND block can be retrieved from the module through register accesses.

#### 7.4.1.1 ELM Features

The ELM has the following features:

- 4, 8, and 16 bits per 512-byte block error-location based on BCH algorithms
- Eight simultaneous processing contexts
- Page-based and continuous modes
- Interrupt generation on error-location process completion:
  - When the full page has been processed in page mode
  - For each syndrome polynomial in continuous mode

#### 7.4.1.2 Unsupported ELM Features

There are no unsupported ELM features in this device.

### 7.4.2 Integration

The error location module (ELM) is used to extract error addresses from syndrome polynomials generated using a BCH algorithm. Each of these polynomials gives a status of the read operations for a 512 bytes block from a NAND flash and its associated BCH parity bits, plus optionally some spare area information.

The ELM is intended to be used in conjunction with the GPMC. Syndrome polynomials generated on-the-fly when reading a NAND Flash page and stored in GPMC registers are passed to the ELM module. The MPU can then easily correct the data block by flipping the bits pointed to by the ELM error locations outputs.

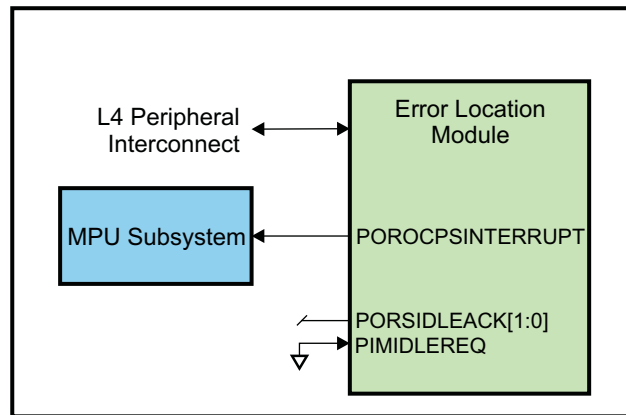

Figure 7-140. ELM Integration

#### 7.4.2.1 ELM Connectivity Attributes

The general connectivity for the ELM module in this device is summarized in [Table 7-163](#).

Table 7-163. ELM Connectivity Attributes

Attributes	Type
Power Domain	Peripheral Domain
Clock Domain	L4PER_L4LS_GCLK
Reset Signals	PER_DOM_RST_N
Idle/Wakeup Signals	Smart Idle
Interrupt Requests	1 interrupt to MPU Subsystem
DMA Requests	None
Physical Address	L4 Peripheral slave port

#### 7.4.2.2 ELM Clock and Reset Management

The ELM operates from a single OCP interface clock.

Table 7-164. ELM Clock Signals

Clock Signal	Max Freq	Reference / Source	Comments
Functional/interface clock	100 MHz	CORE_CLKOUTM4 / 2	pd_per_l4ls_gclk From PRCM

#### 7.4.2.3 ELM Pin List

The ELM module does not include any external interface pins.

### 7.4.3 Functional Description

The ELM is designed around the error-location engine, which handles the computation based on the input syndrome polynomials.

The ELM maps the error-location engine to a standard interconnect interface by using a set of registers to control inputs and outputs.

#### 7.4.3.1 ELM Software Reset

To perform a software reset, write a 1 to the ELM\_SYSCONFIG[1] SOFTRESET bit. The ELM\_SYSSTATUS[0] RESETDONE bit indicates that the software reset is complete when its value is 1. When the software reset completes, the ELM\_SYSCONFIG[1] SOFTRESET bit is automatically reset.

#### 7.4.3.2 ELM Power Management

Table 7-165 describes the power-management features available to the ELM module.

**Table 7-165. Local Power Management Features**

Feature	Registers	Description
Clock autogating	ELM_SYSCONFIG[0] AUTOGATING bit	This bit allows a local power optimization inside the module by gating the ELM_FCLK clock upon the interface activity.
Slave idle modes	ELM_SYSCONFIG[4:3] SIDLEMODE bit field	Force-idle, No-idle, and Smart-idle modes are available.
Clock activity	ELM_SYSCONFIG[8] CLOCKACTIVITY bit	The clock can be switched-off or maintained during the wake-up period.
Master Standby modes	N/A	
Global Wake-up Enable	N/A	
Wake-up Sources Enable	N/A	

#### CAUTION

The PRCM module has no hardware means of reading CLOCKACTIVITY settings. Thus, software must ensure consistent programming between the ELM CLOCKACTIVITY and ELM clock PRCM control bits.

#### 7.4.3.3 ELM Interrupt Requests

Table 7-166 lists the event flags, and their masks, that can cause module interrupts.

**Table 7-166. Events**

Event Flag	Event Mask	Map to	Description
ELM_IRQSTATUS[8] PAGE_VALID	ELM_IRQENABLE[8] PAGE_MASK	ELM_IRQ	Page interrupt
ELM_IRQSTATUS[7] LOC_VALID_7	ELM_IRQENABLE[7] LOCATION_MASK_7	ELM_IRQ	Error-location interrupt for syndrome polynomial 7
ELM_IRQSTATUS[6] LOC_VALID_6	ELM_IRQENABLE[6] LOCATION_MASK_6	ELM_IRQ	Error-location interrupt for syndrome polynomial 6
ELM_IRQSTATUS[5] LOC_VALID_5	ELM_IRQENABLE[5] LOCATION_MASK_5	ELM_IRQ	Error-location interrupt for syndrome polynomial 5
ELM_IRQSTATUS[4] LOC_VALID_4	ELM_IRQENABLE[4] LOCATION_MASK_4	ELM_IRQ	Error-location interrupt for syndrome polynomial 4
ELM_IRQSTATUS[3] LOC_VALID_3	ELM_IRQENABLE[3] LOCATION_MASK_3	ELM_IRQ	Error-location interrupt for syndrome polynomial 3
ELM_IRQSTATUS[2] LOC_VALID_2	ELM_IRQENABLE[2] LOCATION_MASK_2	ELM_IRQ	Error-location interrupt for syndrome polynomial 2

**Table 7-166. Events (continued)**

Event Flag	Event Mask	Map to	Description
ELM_IRQSTATUS[1] LOC_VALID_1	ELM_IRQENABLE[1] LOCATION_MASK_1	ELM_IRQ	Error-location interrupt for syndrome polynomial 1
ELM_IRQSTATUS[0] LOC_VALID_0	ELM_IRQENABLE[0] LOCATION_MASK_0	ELM_IRQ	Error-location interrupt for syndrome polynomial 0

#### 7.4.3.4 Processing Initialization

ELM\_LOCATION\_CONFIG global setting parameters must be set before using the error-location engine. The ELM\_LOCATION\_CONFIG[1:0] ECC\_BCH\_LEVEL bit defines the error-correction level used (4-, 8-, or 16-bit error-correction). The ELM\_LOCATION\_CONFIG[26:16] ECC\_SIZE bit field defines the maximum buffer length beyond which the engine processing no longer looks for errors.

The CPU can choose to use the ELM in continuous mode or page mode. If all ELM\_PAGE\_CTRL[i] SECTOR\_i bits are reset (i is the syndrome polynomial number, i = 0 to 7), continuous mode is used. In any other case, page mode is implicitly selected.

- Continuous mode: Each syndrome polynomial is processed independently – results for a syndrome can be retrieved and acknowledged at any time, whatever the status of the other seven processing contexts.
- Page mode: Syndrome polynomials are grouped into atomic entities – only one page can be processed at any given time, even if all eight contexts are not used for this page. Unused contexts are lost and cannot be affected to any other processing. The full page must be acknowledged and cleared before moving to the next page.

For completion interrupts to be generated correctly, all ELM\_IRQENABLE[i] LOCATION\_MASK\_i bits (i = 0 to 7) must be forced to 0 when in page mode, and set to 1 in continuous mode. Additionally, the ELM\_IRQENABLE[8] PAGE\_MASK bit must be set to 1 when in page mode.

The CPU initiates error-location processing by writing a syndrome polynomial into one of the eight possible register sets. Each of these register sets includes seven registers: ELM\_SYNDROME\_FRAGMENT\_0\_i to ELM\_SYNDROME\_FRAGMENT\_6\_i. The first six registers can be written in any order, but ELM\_SYNDROME\_FRAGMENT\_6\_i must be written last because it includes the validity bit, which instructs the ELM that this syndrome polynomial must be processed (the ELM\_SYNDROME\_FRAGMENT\_6\_i[16] SYNDROME\_VALID bit).

As soon as one validity bit is asserted (ELM\_SYNDROME\_FRAGMENT\_6\_i[16] SYNDROME\_VALID = 0x1, with i = 0 to 7), error-location processing can start for the corresponding syndrome polynomial. The associated ELM\_LOCATION\_STATUS\_i and ELM\_ERROR\_LOCATION\_0\_i to ELM\_ERROR\_LOCATION\_15\_i registers are not reset (i = 0 to 7). The software must not consider them until the corresponding ELM\_IRQSTATUS[i] LOC\_VALID\_i bit is set.

#### 7.4.3.5 Processing Sequence

While the error-location engine is busy processing one syndrome polynomial, further syndrome polynomials can be written. They are processed when the current processing completes.

The engine completes early when:

- No error is detected; that is, when the ELM\_LOCATION\_STATUS\_i[8] ECC\_CORRECTABLE bit is set to 1 and the ELM\_LOCATION\_STATUS\_i[4:0] ECC\_NB\_ERRORS bit field is set to 0x0.
- Too many errors are detected; that is, when the ELM\_LOCATION\_STATUS\_i[8] ECC\_CORRECTABLE bit is set to 0 while the ELM\_LOCATION\_STATUS\_i[4:0] ECC\_NB\_ERRORS bit field is set with the value output by the error-location engine. The reported number of errors is not ensured if ECC\_CORRECTABLE is 0.

If the engine completes early, the associated error-location registers ELM\_ERROR\_LOCATION\_0\_i to ELM\_ERROR\_LOCATION\_15\_i are not updated (i = 0 to 7).

In all other cases, the engine goes through the entire error-location process. Each time an error-location is found, it is logged in the associated ECC\_ERROR\_LOCATION bit field. The first error detected is logged in the ELM\_ERROR\_LOCATION\_0\_i[12:0] ECC\_ERROR\_LOCATION bit field; the second in the ELM\_ERROR\_LOCATION\_1\_i[12:0] ECC\_ERROR\_LOCATION bit field, and so on.

**Table 7-167. ELM\_LOCATION\_STATUS\_i Value Decoding Table**

ECC_CORRECTABLE Value	ECC_NB_ERRORS Value	Status	Number of Errors Detected	Action Required
1	0	OK	0	None
1	≠ 0	OK	ECC_NB_ERRORS	Correct the data buffer read based on the ELM_ERROR_LOCATION_0_i to ELM_ERROR_LOCATION_15_i results.
0	Any	Failed	Unknown	Software-dependant

#### 7.4.3.6 Processing Completion

When the processing for a given syndrome polynomial completes, its ELM\_SYNDROME\_FRAGMENT\_6\_i[16] SYNDROME\_VALID bit is reset. It must not be set again until the exit status registers, ELM\_LOCATION\_STATUS\_i (i = 0 to 7), for this processing are checked. Failure to comply with this rule leads to potential loss of the first polynomial process data output.

The error-location engine signals the process completion to the ELM. When this event is detected, the corresponding ELM\_IRQSTATUS[i] LOC\_VALID\_i bit is set (i = 0 to 7). The processing-exit status is available from the associated ELM\_LOCATION\_STATUS\_i register, and error locations are stored in order in the ECC\_ERROR\_LOCATION fields. The software must only read valid error-location registers based on the number of errors detected and located.

Immediately after the error-location engine completes, a new syndrome polynomial can be processed, if any is available, as reported by the ELM\_SYNDROME\_FRAGMENT\_6\_i[16] SYNDROME\_VALID validity bit, depending on the configured error-correction level. If several syndrome polynomials are available, a round-robin arbitration is used to select one for processing.

In continuous mode (that is, all bits in ELM\_PAGE\_CTRL are reset), an interrupt is triggered whenever a ELM\_IRQSTATUS[i] LOC\_VALID\_i bit is asserted. The CPU must read the ELM\_IRQSTATUS register to determine which polynomial is processed and retrieve the exit status and error locations (ELM\_LOCATION\_STATUS\_i and ELM\_ERROR\_LOCATION\_0\_i to ELM\_ERROR\_LOCATION\_15\_i). When done, the CPU must clear the corresponding ELM\_IRQSTATUS[i] LOC\_VALID\_i bit by writing it to 1. Other status bits must be written to 0 so that other interrupts are not unintentionally cleared. When using this mode, the ELM\_IRQSTATUS[8] PAGE\_VALID interrupt is never triggered.

In page mode, the module does not trigger interrupts for the processing completion of each polynomial because the ELM\_IRQENABLE[i] LOCATION\_MASK\_i bits are cleared. A page is defined using the ELM\_PAGE\_CTRL register. Each SECTOR\_i bit set means the corresponding polynomial i is part of the page processing. A page is fully processed when all tagged polynomials have been processed, as logged in the ELM\_IRQSTATUS[i] LOC\_VALID\_i bit fields. The module triggers an ELM\_IRQSTATUS[8] PAGE\_VALID interrupt whenever it detects that the full page has been processed. To make sure the next page can be correctly processed, all status bits in the ELM\_IRQSTATUS register must be cleared by using a single atomic-write access.

---

**NOTE:** Do not modify page setting parameters in the ELM\_PAGE\_CTRL register unless the engine is idle, no polynomial input is valid, and all interrupts have been cleared.

---

Because no polynomial-level interrupt is triggered in page mode, polynomials cleared in the ELM\_PAGE\_CTRL[i] SECTOR\_i bit fields (i = 0 to 7) are processed as usual, but are essentially ignored. The CPU must manually poll the ELM\_IRQSTATUS bits to check for their status.

## 7.4.4 Basic Programming Model

### 7.4.4.1 ELM Low Level Programming Model

#### 7.4.4.1.1 Processing Initialization

**Table 7-168. ELM Processing Initialization**

Step	Register/ Bit Field / Programming Model	Value
Resets the module	ELM_SYSCONFIG[1] SOFTRESET	0x1
Wait until reset is done.	ELM_SYSSTATUS[0] RESETDONE	0x1
Configure the slave interface power management.	ELM_SYSCONFIG[4:3] SIDLEMODE	Set value
Defines the error-correction level used	ELM_LOCATION_CONFIG[1:0] ECC_BCH_LEVEL	Set value
Defines the maximum buffer length	ELM_LOCATION_CONFIG[26:16] ECC_SIZE	Set value
Sets the ELM in continuous mode or page mode	ELM_PAGE_CTRL	Set value
<b>If</b> continuous mode is used	All ELM_PAGE_CTRL[i] SECTOR_i (i = 0 to 7)	0x0
Enables interrupt for syndrome polynomial i	ELM_IRQENABLE[i] LOCATION_MASK_i	0x1
<b>else</b> (page mode is used)	One syndrome polynomial i is set ELM_PAGE_CTRL[i] SECTOR_i (i = 0 to 7)	0x1
Disable all interrupts for syndrome polynomial and enable PAGE_MASK interrupt.	All ELM_IRQENABLE[i] LOCATION_MASK_i = 0x0 and ELM_IRQENABLE[8] PAGE_MASK = 0x1	Set value
<b>endif</b>		Set value
Set the input syndrome polynomial i.	ELM_SYNDROME_FRAGMENT_0_i	Set value
	ELM_SYNDROME_FRAGMENT_1_i	Set value
	ELM_SYNDROME_FRAGMENT_5_i	Set value
	ELM_SYNDROME_FRAGMENT_6_i	Set value
Initiates the computation process	ELM_SYNDROME_FRAGMENT_6_i[16] SYNDROME_VALID	0x1

#### 7.4.4.1.2 Read Results

The engine goes through the entire error-location process and results can be read. [Table 7-169](#) and [Table 7-170](#) describe the processing completion for continuous and page modes, respectively.

**Table 7-169. ELM Processing Completion for Continuous Mode**

Step	Register/ Bit Field / Programming Model	Value
Wait until process is complete for syndrome polynomial i: Wait until the ELM_IRQ interrupt is generated, or poll the status register.		
Read for which i the error-location process is complete.	ELM_IRQSTATUS[i] LOC_VALID_i	0x1
<b>if</b> the process fails (too many errors) It is software dependant.	ELM_LOCATION_STATUS_i[8] ECC_CORRECTABLE	0x0
<b>else</b> (process successful, the engine completes)	ELM_LOCATION_STATUS_i[8] ECC_CORRECTABLE	0x1
Read the number of errors.	ELM_LOCATION_STATUS_i[4:0] ECC_NB_ERRORS	
Read the error-location bit addresses for syndrome polynomial i of the ECC_NB_ERRORS first registers. It is the software responsibility to correct errors in the data buffer.	ELM_ERROR_LOCATION_0_i[12:0] ECC_ERROR_LOCATION	
	ELM_ERROR_LOCATION_1_i[12:0] ECC_ERROR_LOCATION	
	...	
	ELM_ERROR_LOCATION_15_i[12:0] ECC_ERROR_LOCATION	

**Table 7-169. ELM Processing Completion for Continuous Mode (continued)**

Step	Register/ Bit Field / Programming Model	Value
<b>endif</b>		
Clear the corresponding i interrupt.	ELM_IRQSTATUS[i] LOC_VALID_i	0x1

A new syndrome polynomial can be processed after the end of processing (ELM\_SYNDROME\_FRAGMENT\_6\_i[16] SYNDROME\_VALID = 0x0) and after the exit status register check (ELM\_LOCATION\_STATUS\_i).

**Table 7-170. ELM Processing Completion for Page Mode**

Step	Register/ Bit Field / Programming Model	Value
Wait until process is complete for syndrome polynomial i: Wait until the ELM_IRQ interrupt is generated, or poll the status register.		
Wait for page completed interrupt: All error locations are valid.	ELM_IRQSTATUS[8] PAGE_VALID	0x1
<b>Repeat</b> the following actions the necessary number of times. That is, once for each valid defined block in the page.		
Read the process exit status.	ELM_LOCATION_STATUS_i[8] ECC_CORRECTABLE	
<b>if</b> the process fails (too many errors)	ELM_LOCATION_STATUS_i[8] ECC_CORRECTABLE	0x0
It is software dependant.		
<b>else</b> (process successful, the engine completes)	ELM_LOCATION_STATUS_i[8] ECC_CORRECTABLE	0x1
Read the number of errors.	ELM_LOCATION_STATUS_i[4:0] ECC_NB_ERRORS	
Read the error-location bit addresses for syndrome polynomial i of the ECC_NB_ERRORS first registers.	ELM_ERROR_LOCATION_0_i[12:0] ECC_ERROR_LOCATION	
	ELM_ERROR_LOCATION_1_i[12:0] ECC_ERROR_LOCATION	
	...	
	ELM_ERROR_LOCATION_15_i[12:0] ECC_ERROR_LOCATION	
<b>endif</b>		
<b>End Repeat</b>		
Clear the ELM_IRQSTATUS register.	ELM_IRQSTATUS	0x1FF

Next page can be correctly processed after a page is fully processed, when all tagged polynomials have been processed (ELM\_IRQSTATUS[i] LOC\_VALID\_i = 0x1 for all syndrome polynomials i used in the page).

#### 7.4.4.2 Use Case: ELM Used in Continuous Mode

In this example, the ELM module is programmed for an 8-bit error-correction capability in continuous mode. After reading a 528-byte NAND flash sector (512B data plus 16B spare area) with a 16-bit interface, a non-zero polynomial syndrome is reported from the GPMC (Polynomial syndrome 0 is used in the ELM):

- P = 0x0A16ABE115E44F767BFB0D0980

**Table 7-171. Use Case: Continuous Mode**

Step	Register/ Bit Field / Programming Model	Value
Resets the module	ELM_SYSCONFIG[1] SOFTRESET	0x1
Wait until reset is done.	ELM_SYSSTATUS[0] RESETDONE	0x1
Configure the slave interface power management: Smart idle is used.	ELM_SYSCONFIG[4:3] SIDLEMODE	0x2

**Table 7-171. Use Case: Continuous Mode (continued)**

Step	Register/ Bit Field / Programming Model	Value
Defines the error-correction level used: 8 bits	ELM_LOCATION_CONFIG[1:0] ECC_BCH_LEVEL	0x1
Defines the maximum buffer length: 528 bytes (2x528 = 1056)	ELM_LOCATION_CONFIG[26:16] ECC_SIZE	0x420
Sets the ELM in continuous mode	ELM_PAGE_CTRL	0
Enables interrupt for syndrome polynomial 0	ELM_IRQENABLE[0] LOCATION_MASK_0	0x1
Set the input syndrome polynomial 0.	ELM_SYNDROME_FRAGMENT_0_i (i=0)	0xFB0D0980
	ELM_SYNDROME_FRAGMENT_1_i (i=0)	0xE44F767B
	ELM_SYNDROME_FRAGMENT_2_i (i=0)	0x16ABE115
	ELM_SYNDROME_FRAGMENT_3_i (i=0)	0x0000000A
Initiates the computation process	ELM_SYNDROME_FRAGMENT_6_i[16] SYNDROME_VALID (i=0)	0x1
Wait until process is complete for syndrome polynomial 0: IRQ_ELM is generated or poll the status register.		
Read that error-location process is complete for syndrome polynomial 0.	ELM_IRQSTATUS[0] LOC_VALID_0	0x1
Read the process exit status: All errors were successfully located.	ELM_LOCATION_STATUS_i[8] ECC_CORRECTABLE (i=0)	0x1
Read the number of errors: Four errors detected.	ELM_LOCATION_STATUS_i[4:0] ECC_NB_ERRORS (i=0)	0x4
Read the error-location bit addresses for syndrome polynomial 0 of the 4 first registers: Errors are located in the data buffer at decimal addresses 431, 1062, 1909, 3452.	ELM_ERROR_LOCATION_0_i (i=0)	0x1AF
	ELM_ERROR_LOCATION_1_i (i=0)	0x426
	ELM_ERROR_LOCATION_2_i (i=0)	0x775
	ELM_ERROR_LOCATION_3_i (i=0)	0xD7C
Clear the corresponding interrupt for polynomial 0.	ELM_IRQSTATUS[0] LOC_VALID_0	0x1

The NAND flash data in the sector are seen as a polynomial of degree 4223 (number of bits in a 528 byte buffer minus 1), with each data bit being a coefficient in the polynomial. When reading from a NAND flash using the GPMC module, computation of the polynomial syndrome assumes that the first NAND word read at address 0x0 contains the highest-order coefficient in the message. Furthermore, in the 16-bit NAND word, bits are ordered from bit 7 to bit 0, then from bit 15 to bit 8. Based on this convention, an address table of the data buffer can be built. NAND memory addresses in [Table 7-172](#) are given in decimal format.

**Table 7-172. 16-bit NAND Sector Buffer Address Map**

NAND Memory Address	Message bit addresses in the memory word															
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	4215	4214	4213	4212	4211	4210	4209	4208	4223	4222	4221	4220	4219	4218	4217	4216
1	4175	4174	4173	4172	4171	4170	4169	4168	4183	4182	4181	4180	4179	4178	4177	4176
...																
47	3463	3462	3461	3460	3459	3458	3457	3456	3471	3470	3469	3468	3467	3466	3465	3464

50	3415	3414	3413	3412	3411	3410	3409	3408	3423	3422	3421	3420	3419	3418	3417	3416
...																
255	135	134	133	132	131	130	129	128	143	142	141	140	139	138	137	136
256	119	118	117	116	115	114	113	112	127	126	125	124	123	122	121	120
257	103	102	101	100	99	98	97	96	111	110	109	108	107	106	105	104
258	87	86	85	84	83	82	81	80	95	94	93	92	91	90	89	88
259	71	70	69	68	67	66	65	64	79	78	77	76	75	74	73	72
260	55	54	53	52	51	50	49	48	63	62	61	60	59	58	57	56
261	39	38	37	36	35	34	33	32	47	46	45	44	43	42	41	40
262	23	22	21	20	19	18	17	16	31	30	29	28	27	26	25	24
263	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8

The table can now be used to determine which bits in the buffer were incorrect and must be flipped. In this example, the first bit to be flipped is bit 4 from the 49th byte read from memory. It is up to the processor to correctly map this word to the copied buffer and to flip this bit. The same process must be repeated for all detected errors.

#### 7.4.4.3 Use Case: ELM Used in Page Mode

In this example, the ELM module is programmed for an 16-bit error-correction capability in page mode. After reading a 528-byte NAND flash sector (512B data plus 16B spare area) with a 16-bit interface, four non-zero polynomial syndromes are reported from the GPMC (Polynomial syndrome 0, 1, 2, and 3 are used in the ELM):

- P0 = 0xE8B0 12ADB5A318E05BE B0693DB28330B5CC A329AA05E0B718EF
- P1 = 0xBAD0 49A0D932C22E6669 0948DF08BE093336 79C6BA10E5F935EB
- P2 = 0x69D9 B86ABCD5EC3697FA A6498FEE54556EA0 1579EF7D60BA3189
- P3 = 0x0

**Table 7-173. Use Case: Page Mode**

Step	Register/ Bit Field / Programming Model	Value
Resets the module	ELM_SYSCONFIG[1] SOFTRESET	0x1
Wait until reset is done.	ELM_SYSSTATUS[0] RESETDONE	0x1
Configure the slave interface power management: Smart idle is used.	ELM_SYSCONFIG[4:3] SIDLEMODE	0x2
Defines the error-correction level used: 16 bits	ELM_LOCATION_CONFIG[1:0] ECC_BCH_LEVEL	0x2
Defines the maximum buffer length: 528 bytes	ELM_LOCATION_CONFIG[26:16] ECC_SIZE	0x420
Sets the ELM in page mode (4 blocks in a page)	ELM_PAGE_CTRL[0] SECTOR_0	0x1
	ELM_PAGE_CTRL[1] SECTOR_1	0x1
	ELM_PAGE_CTRL[2] SECTOR_2	0x1
	ELM_PAGE_CTRL[3] SECTOR_3	0x1

**Table 7-173. Use Case: Page Mode (continued)**

Step	Register/ Bit Field / Programming Model	Value
Disable all interrupts for syndrome polynomial and enable PAGE_MASK interrupt.	ELM_IRQENABLE	0x100
Set the input syndrome polynomial 0.	ELM_SYNDROME_FRAGMENT_0_i (i=0)	0xE0B718EF
	ELM_SYNDROME_FRAGMENT_1_i (i=0)	0xA329AA05

880h-8BCh + (100h × i)	ELM_ERROR_LOCATION_0-15_i	ELM_ERROR_LOCATION_0-15_i Registers	<a href="#">Section 7.4.5.16</a>

<sup>(1)</sup> i = 0 to 8

### 7.4.5.1 ELM Revision Register (ELM\_REVISION)

This register contains the IP revision code. The ELM Revision Register (ELM\_REVISION) is shown in [Figure 7-141](#) and described in [Table 7-175](#).

**Figure 7-141. ELM Revision Register (ELM\_REVISION)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-175. ELM Revision Register (ELM\_REVISION) Field Descriptions**

Bit	Field	Value	Description
31-0	REVISION	0-FFFF FFFFh	IP Revision

### 7.4.5.2 ELM System Configuration Register (ELM\_SYSCONFIG)

This register allows controlling various parameters of the OCP interface. The ELM System Configuration Register (ELM\_SYSCONFIG) is shown in [Figure 7-142](#) and described in [Table 7-176](#).

**Figure 7-142. ELM System Configuration Register (ELM\_SYSCONFIG)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-176. ELM System Configuration Register (ELM\_SYSCONFIG) Field Descriptions**

Bit	Field	Value	Description
31-9	Reserved	0	Reserved
8	CLOCKACTIVITYOCP	0 1	OCP Clock activity when module is in IDLE mode (during wake up mode period). OCP Clock can be switch-off OCP Clock is maintained during wake up period
7-5	Reserved	0	Reserved
4-3	SIDLEMODE	0 1h 2h 3h	Slave interface power management (IDLE req/ack control). FORCE Idle. IDLE request is acknowledged unconditionally and immediately. (Default <i>Dumb</i> mode for safety) NO idle. IDLE request is never acknowledged. SMART Idle. The acknowledgment to an IDLE request is given based on the internal activity. Reserved - do not use
2	Reserved	0	Reserved
1	SOFTRESET	0 1	Module software reset. This bit is automatically reset by hardware (During reads, it always returns 0.). It has same effect as the OCP hardware reset. Normal mode. Start soft reset sequence.
0	AUTOGATING	0 1	Internal OCP clock gating strategy. (No module visible impact other than saving power.) OCP clock is free-running. Automatic internal OCP clock gating strategy is applied based on the OCP interface activity.

### 7.4.5.3 ELM System Status Register (ELM\_SYSSTATUS)

The ELM System Status Register (ELM\_SYSSTATUS) is shown in [Figure 7-143](#) and described in [Table 7-177](#).

**Figure 7-143. ELM System Status Register (ELM\_SYSSTATUS)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

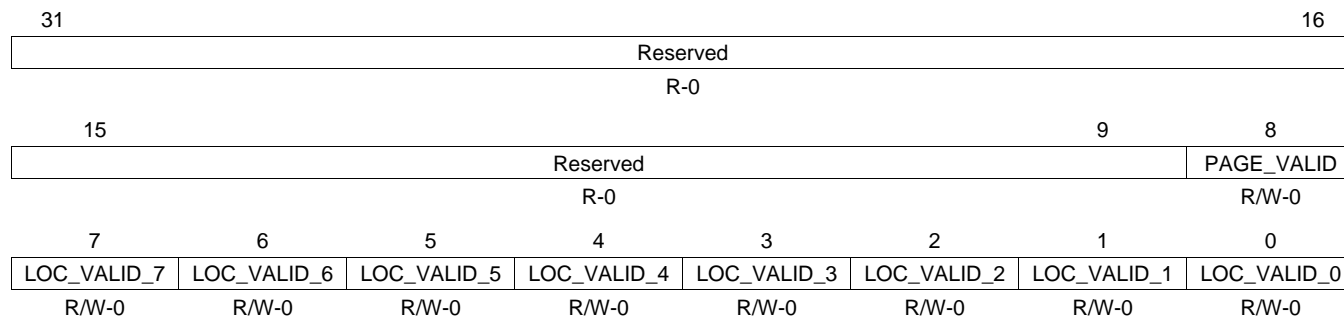

**Table 7-177. ELM System Status Register (ELM\_SYSSTATUS) Field Descriptions**

Bit	Field	Value	Description
31-1	Reserved	0	Reserved
0	RESETDONE	0	Internal reset monitoring (OCP domain). Undefined since: From hardware perspective, the reset state is 0. From software user perspective, when the accessible module is 1.
		0	Reset is on-going
		1	Reset is done (completed)

#### 7.4.5.4 ELM Interrupt Status Register (ELM\_IRQSTATUS)

This register doubles as a status register for the error-location processes. The ELM Interrupt Status Register (ELM\_IRQSTATUS) is shown in [Figure 7-144](#) and described in [Table 7-178](#).

**Figure 7-144. ELM Interrupt Status Register (ELM\_IRQSTATUS)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-178. ELM Interrupt Status Register (ELM\_IRQSTATUS) Field Descriptions**

Bit	Field	Value	Description
31-9	Reserved	0	Reserved
8	PAGE_VALID	0	Error-location status for a full page, based on the mask definition.
		0	Read: Error locations invalid for all polynomials enabled in the ECC_INTERRUPT_MASK register.
		1	Read: All error locations valid.
		0	Write: No effect.
7	LOC_VALID_7	1	Write: Clear interrupt.
		0	Error-location status for syndrome polynomial 7.
		0	Read: No syndrome processed or process in progress.
		1	Read: Error-location process completed.
6	LOC_VALID_6	0	Write: No effect.
		1	Write: Clear interrupt.
		0	Error-location status for syndrome polynomial 6.
		0	Read: No syndrome processed or process in progress.
5	LOC_VALID_5	1	Read: Error-location process completed.
		0	Write: No effect.
		1	Write: Clear interrupt.
		0	Error-location status for syndrome polynomial 5.
4	LOC_VALID_4	0	Read: No syndrome processed or process in progress.
		1	Read: Error-location process completed.
		0	Write: No effect.
		1	Write: Clear interrupt.
3	LOC_VALID_3	0	Error-location status for syndrome polynomial 3.
		0	Read: No syndrome processed or process in progress.
		1	Read: Error-location process completed.
		0	Write: No effect.
		1	Write: Clear interrupt.

**Table 7-178. ELM Interrupt Status Register (ELM\_IRQSTATUS) Field Descriptions (continued)**

Bit	Field	Value	Description
2	LOC_VALID_2		Error-location status for syndrome polynomial 2.
		0	Read: No syndrome processed or process in progress.
		1	Read: Error-location process completed.
			Write: No effect.
1	LOC_VALID_1		Error-location status for syndrome polynomial 1.
		0	Read: No syndrome processed or process in progress.
		1	Read: Error-location process completed.
			Write: No effect.
0	LOC_VALID_0		Error-location status for syndrome polynomial 0.
		0	Read: No syndrome processed or process in progress.
		1	Read: Error-location process completed.
			Write: No effect.
		1	Write: Clear interrupt.

### 7.4.5.5 ELM Interrupt Enable Register (ELM\_IRQENABLE)

The ELM Interrupt Enable Register (ELM\_IRQENABLE) is shown in [Figure 7-145](#) and described in [Table 7-179](#).

**Figure 7-145. ELM Interrupt Enable Register (ELM\_IRQENABLE)**

	Reserved						
	R-0						
15	Reserved	9      8					
	R-0	PAGE_MASK R/W-0					
7	6      5      4      3      2      1      0						
LOCATION_ MASK_7	LOCATION_ MASK_6	LOCATION_ MASK_5	LOCATION_ MASK_4	LOCATION_ MASK_3	LOCATION_ MASK_2	LOCATION_ MASK_1	LOCATION_ MASK_0
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-179. ELM Interrupt Enable Register (ELM\_IRQENABLE) Field Descriptions**

Bit	Field	Value	Description
31-9	Reserved	0	Reserved
8	PAGE_MASK	0 1	Page interrupt mask bit Disable interrupt. Enable interrupt.
7	LOCATION_MASK_7	0 1	Error-location interrupt mask bit for syndrome polynomial 7. Disable interrupt. Enable interrupt.
6	LOCATION_MASK_6	0 1	Error-location interrupt mask bit for syndrome polynomial 6. Disable interrupt. Enable interrupt.
5	LOCATION_MASK_5	0 1	Error-location interrupt mask bit for syndrome polynomial 5. Disable interrupt. Enable interrupt.
4	LOCATION_MASK_4	0 1	Error-location interrupt mask bit for syndrome polynomial 4. Disable interrupt. Enable interrupt.
3	LOCATION_MASK_3	0 1	Error-location interrupt mask bit for syndrome polynomial 3. Disable interrupt. Enable interrupt.
2	LOCATION_MASK_2	0 1	Error-location interrupt mask bit for syndrome polynomial 2. Disable interrupt. Enable interrupt.
1	LOCATION_MASK_1	0 1	Error-location interrupt mask bit for syndrome polynomial 1. Disable interrupt. Enable interrupt.
0	LOCATION_MASK_0	0 1	Error-location interrupt mask bit for syndrome polynomial 0. Disable interrupt. Enable interrupt.

### 7.4.5.6 ELM Location Configuration Register (ELM\_LOCATION\_CONFIG)

The ELM Location Configuration Register (ELM\_LOCATION\_CONFIG) is shown in [Figure 7-146](#) and described in [Table 7-180](#).

**Figure 7-146. ELM Location Configuration Register (ELM\_LOCATION\_CONFIG)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-180. ELM Location Configuration Register (ELM\_LOCATION\_CONFIG) Field Descriptions**

Bit	Field	Value	Description
31-27	Reserved	0	Reserved
26-16	ECC_SIZE	0-7FFh	Maximum size of the buffers for which the error-location engine is used, in number of nibbles (4-bits entities)
15-2	Reserved	0	Reserved
1-0	ECC_BCH_LEVEL	0 0h 1h 2h 3h	Error correction level. 4 bits. 8 bits. 16 bits. Reserved.

### 7.4.5.7 ELM Page Definition Register (ELM\_PAGE\_CTRL)

The ELM Page Definition Register (ELM\_PAGE\_CTRL) is shown in [Figure 7-147](#) and described in [Table 7-181](#).

**Figure 7-147. ELM Page Definition Register (ELM\_PAGE\_CTRL)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-181. ELM Page Definition Register (ELM\_PAGE\_CTRL) Field Descriptions**

Bit	Field	Value	Description
31-8	Reserved	0	Reserved.
7	SECTOR_7	0-1	Set to 1 if syndrome polynomial 7 is part of the page in page mode. Must be 0 in continuous mode.
6	SECTOR_6	0-1	Set to 1 if syndrome polynomial 6 is part of the page in page mode. Must be 0 in continuous mode.
5	SECTOR_5	0-1	Set to 1 if syndrome polynomial 5 is part of the page in page mode. Must be 0 in continuous mode.
4	SECTOR_4	0-1	Set to 1 if syndrome polynomial 4 is part of the page in page mode. Must be 0 in continuous mode.
3	SECTOR_3	0-1	Set to 1 if syndrome polynomial 3 is part of the page in page mode. Must be 0 in continuous mode.
2	SECTOR_2	0-1	Set to 1 if syndrome polynomial 2 is part of the page in page mode. Must be 0 in continuous mode.
1	SECTOR_1	0-1	Set to 1 if syndrome polynomial 1 is part of the page in page mode. Must be 0 in continuous mode.
0	SECTOR_0	0-1	Set to 1 if syndrome polynomial 0 is part of the page in page mode. Must be 0 in continuous mode.

#### 7.4.5.8 ELM\_SYNDROME\_FRAGMENT\_0\_i Register

The ELM\_SYNDROME\_FRAGMENT\_0\_i Register is shown in [Figure 7-148](#) and described in [Table 7-182](#).

**Figure 7-148. ELM\_SYNDROME\_FRAGMENT\_0\_i Register**

## ***Power, Reset, and Clock Management (PRCM)***

---

---

This chapter describes the PRCM of the device.

Topic	Page
<b>8.1 Power, Reset, and Clock Management .....</b>	<b>500</b>

## 8.1 Power, Reset, and Clock Management

### 8.1.1 Introduction

The device power-management architecture ensures maximum performance and operation time for user satisfaction (audio/video support) while offering versatile power-management techniques for maximum design flexibility, depending on application requirements. This introduction contains the following information:

- Power-management architecture building blocks for the device
- State-of-the-art power-management techniques supported by the power-management architecture of the device

### 8.1.2 Device Power-Management Architecture Building Blocks

To provide a versatile architecture supporting multiple power-management techniques, the power-management framework is built with three levels of resource management: clock, power, and voltage management.

These management levels are enforced by defining the managed entities or building blocks of the power-management architecture, called the clock, power, and voltage domains. A domain is a group of modules or subsections of the device that share a common entity (for example, common clock source, common voltage source, or common power switch). The group forming the domain is managed by a policy manager. For example, a clock for a clock domain is managed by a dedicated clock manager within the power, reset, and clock management (PRCM) module. The clock manager considers the joint clocking constraints of all the modules belonging to that clock domain (and, hence, receiving that clock).

### 8.1.3 Clock Management

The PRCM module along with the control module manages the gating (that is, switching off) and enabling of the clocks to the device modules. The clocks are managed based on the requirement constraints of the associated modules. The following sections identify the module clock characteristics, management policy, clock domains, and clock domain management

#### 8.1.3.1 Module Interface and Functional Clocks

Each module within the device has specific clock input characteristic requirements. Based on the characteristics of the clocks delivered to the modules, the clocks are divided into two categories: interface clocks and functional clocks

**Figure 8-1. Functional and Interface Clocks**

The interface clocks have the following characteristics:

- They ensure proper communication between any module/subsystem and interconnect.
- In most cases, they supply the system interconnect interface and registers of the module.
- A typical module has one interface clock, but modules with multiple interface clocks may also exist (that is, when connected to multiple interconnect buses).

- Interface clock management is done at the device level.
- From the standpoint of the PRCM module, an interface clock is identified by an `_ICLK` suffix.

Functional clocks have the following characteristics:

- They supply the functional part of a module or subsystem.
- A module can have one or more functional clocks. Some functional clocks are mandatory, while others are optional. A module needs its mandatory clock(s) to be operational. The optional clocks are used for specific features and can be shut down without stopping the module activity
- From the standpoint of the PRCM module, a functional clock is distributed directly to the related modules through a dedicated clock tree. It is identified with an `_FCLK` suffix

### 8.1.3.2 Module-Level Clock Management

Each module in the device may also have specific clock requirements. Certain module clocks must be active when operating in specific modes, or may be gated otherwise. Globally, the activation and gating of the module clocks are managed by the PRCM module. Hence, the PRCM module must be aware of when to activate and when to gate the module clocks. The PRCM module differentiates the clock-management behavior for device modules based on whether the module can initiate transactions on the device interconnect (called master module or initiators) or cannot initiate transactions and only responds to the transactions initiated by the master (called slave module or targets). Thus, two hardware-based power-management protocols are used:

- Master standby protocol: Clock-management protocol between the PRCM and master modules.
- Slave idle protocol: Clock-management protocol between the PRCM and slave modules.

#### 8.1.3.2.1 Master Standby Protocol

Master standby protocol is used to indicate that a master module must initiate a transaction on the device interconnect and requests specific (functional and interface) clocks for the purpose. The PRCM module ensures that the required clocks are active when the master module requests the PRCM module to enable them. This is called a module wake-up transition and the module is said to be functional after this transition completes. Similarly, when the master module no longer requires the clocks, it informs the PRCM module, which can then gate the clocks to the module. The master module is then said to be in standby mode. Although the protocol is completely hardware-controlled, software must configure the clock-management behavior for the module. This is done by setting the module register bit field `<Module>_SYSCONFIG.MIDDLEMODE` or `<Module>_SYSCONFIG.STANDBYMODE`. The behavior, identified by standby mode values, must be configured.

**Table 8-1. Master Module Standby-Mode Settings**

Standby Mode Value	Selected Mode	Description
0x0	Force-standby	The module unconditionally asserts the standby request to the PRCM module, regardless of its internal operations. The PRCM module may gate the functional and interface clocks to the module. This mode must be used carefully because it does not prevent the loss of data at the time the clocks are gated.
0x1	No-standby	The module never asserts the standby request to the PRCM module. This mode is safe from a module point of view because it ensures that the clocks remain active. However, it is not efficient from a power-saving perspective because it never allows the output clocks of the PRCM module to be gated

**Table 8-1. Master Module Standby-Mode Settings (continued)**

Standby Mode Value	Selected Mode	Description
0x2	Smart-standby	The module asserts the standby request based on its internal activity status. The standby signal is asserted only when all ongoing transactions are complete and the module is idled. The PRCM module can then gate the clocks to the module.
0x3	Smart-standbywakeup-capable mode	The module asserts the standby request based on its internal activity status. The standby signal is asserted only when all ongoing transactions are complete and the module is idle. The PRCM module can then gate the clocks to the module. The module may generate (master-related) wake-up events when in STANDBY state. The mode is relevant only if the appropriate module mwakeup output is implemented.

The standby status of a master module is indicated by the CM\_<Power\_domain>\_<Module>\_CLKCTRL[x]. STBYST bit in the PRCM module.

**Table 8-2. Master Module Standby Status**

STBYST Bit Value	Description
0x0	The module is functional.
0x1	The module is in standby mode

### 8.1.3.2.2 Slave Idle Protocol

This hardware protocol allows the PRCM module to control the state of a slave module. The PRCM module informs the slave module, through assertion of an idle request, when its clocks (interface and functional) can be gated. The slave can then acknowledge the request from the PRCM module and the PRCM module is then allowed to gate the clocks to the module. A slave module is said to be in IDLE state when its clocks are gated by the PRCM module. Similarly, an idled slave module may need to be wakened because of a service request from a master module or as a result of an event (called a wake-up event; for example, interrupt or DMA request) received by the slave module. In this situation the PRCM module enables the clocks to the module and then deasserts the idle request to signal the module to wake up. Although the protocol is completely hardware-controlled, software must configure the clock-management behavior for the slave module. This is done by setting the module register bit field <Module>\_SYSCONFIG.SIDLEMODE or <Module>\_SYSCONFIG.IDLEMODE. The behavior, listed in the Idle Mode Value column, must be configured by software.

**Table 8-3. Module Idle Mode Settings**

Idle Mode Value	Selected Mode	Description
0x0	Force-idle	The module unconditionally acknowledges the idle request from the PRCM module, regardless of its internal operations. This mode must be used carefully because it does not prevent the loss of data at the time the clock is switched off.
0x1	No-idle	The module never acknowledges any idle request from the PRCM module. This mode is safe from a module point of view because it ensures that the clocks remain active. However, it is not efficient from a power-saving perspective because it does not allow the PRCM module output clock to be shut off, and thus the power domain to be set to a lower power state.

**Table 8-3. Module Idle Mode Settings (continued)**

Idle Mode Value	Selected Mode	Description
0x2	Smart-idle	The module acknowledges the idle request basing its decision on its internal activity. Namely, the acknowledge signal is asserted only when all pending transactions, interrupts, or direct memory access (DMA) requests are processed. This is the best approach to efficient system power management.
0x3	Smart-idle wakeup-capable mode	The module acknowledges the idle request basing its decision on its internal wakeup-capable mode activity. Namely, the acknowledge signal is asserted only when all pending transactions, interrupts, or DMA requests are processed. This is the best approach to efficient system power management. The module may generate (IRQ- or DMA-request-related) wake-up events when in IDLE state. The mode is relevant only if the appropriate module wakeup output(s) is implemented.

The idle status of a slave module is indicated by the CM\_<Powerdomain>\_<Module>\_CLKCTRL[x] IDLEST bit field in the PRCM module.

**Table 8-4. Idle States for a Slave Module**

IDLEST Bit VALUE	Idle Status	Description
0x0	Functional	The module is fully functional. The interface and functional clocks are active.
0x1	In transition	The module is performing a wake-up or a sleep transition.
0x2	Interface idle	The module interface clock is idled. The module may remain functional if using a separate functional clock.
0x3	Full idle	The module is fully idle. The interface and functional clocks are gated in the module.

For the idle protocol management on the PRCM module side, the behavior of the PRCM module is configured in the CM\_<Power domain>\_<module>\_CLKCTRL[x] MODULEMODE bit field. Based on the configured behavior, the PRCM module asserts the idle request to the module unconditionally (that is, immediately when the software requests).

**Table 8-5. Slave Module Mode Settings in PRCM**

MODULEMODE Bit VALUE	Selected Mode	Description
0x0	Disabled	The PRCM module unconditionally asserts the module idle request. This request applies to the gating of the functional and interface clocks to the module. If acknowledged by the module, the PRCM module can gate all clocks to the module (that is, the module is completely disabled)..
0x1	Reserved	NA

**Table 8-5. Slave Module Mode Settings in PRCM (continued)**

MODULEMODE Bit VALUE	Selected Mode	Description
0x2	Enabled	This mode applies to a module when the PRCM module manages its interface and functional clocks. The functional clock to the module remains active unconditionally, while the PRCM module automatically asserts/deasserts the module idle request based on the clock-domain transitions. If acknowledged by the module, the PRCM module can gate only the interface clock to the module.
0x3	Reserved	NA

In addition to the IDLE and STANDBY protocol, PRCM offers also the possibility to manage optional clocks, through a direct SW control: "OptFclken" bit from programming register.

**Table 8-6. Module Clock Enabling Condition**

Clock Enabling		
Clock associated with STANDBY protocol	AND	Clock Domain is ready
		OR
		MStandby is de-asserted Mwakeup is asserted
Clock associated with IDLE protocol, as interface clock	AND	Clock Domain is ready
		OR
		Idle status = FUNCT Idle status = TRANS SWakeup is asserted
Clock associated with IDLE protocol, as functional clock	AND	Clock Domain is ready
		OR
		Idle status = FUNCT Idle status = IDLE Idle status = TRANS SWakeup is asserted
Optional clock	AND	Clock domain is ready
		OptFclken=Enabled ('1')

### 8.1.3.3 Clock Domain

A clock domain is a group of modules fed by clock signals controlled by the same clock manager in the PRCM module. By gating the clocks in a clock domain, the clocks to all the modules belonging to that clock domain can be cut to lower their active power consumption (that is, the device is on and the clocks to the modules are dynamically switched to ACTIVE or INACTIVE (GATED) states). Thus, a clock domain allows control of the dynamic power consumption of the device. The device is partitioned into multiple clock domains, and each clock domain is controlled by an associated clock manager within the PRCM module. This allows the PRCM module to individually activate and gate each clock domain of the device.

Figure 8-2. Generic Clock Domain

Figure above is an example of two clock managers: CM\_a and CM\_b. Each clock manager manages a clock domain. The clock domain of CM\_b is composed of two clocks: a functional clock (FCLK2) and an interface clock (ICLK1), while the clock domain of CM\_a consists of a clock (CLK1) that is used by the module as a functional and interface clock. The clocks to Module 2 can be gated independently of the clock to Module 1, thus ensuring power savings when Module 2 is not in use. The PRCM module lets software check the status of the clock domain functional clocks. The CM\_<Clock domain>\_CLKSTCTRL[x] CLKACTIONITY\_<FCLK/Clock name\_FCLK> bit in the PRCM module identifies the state of the functional clock(s) within the clock domain. Table shows the possible states of the functional clock.

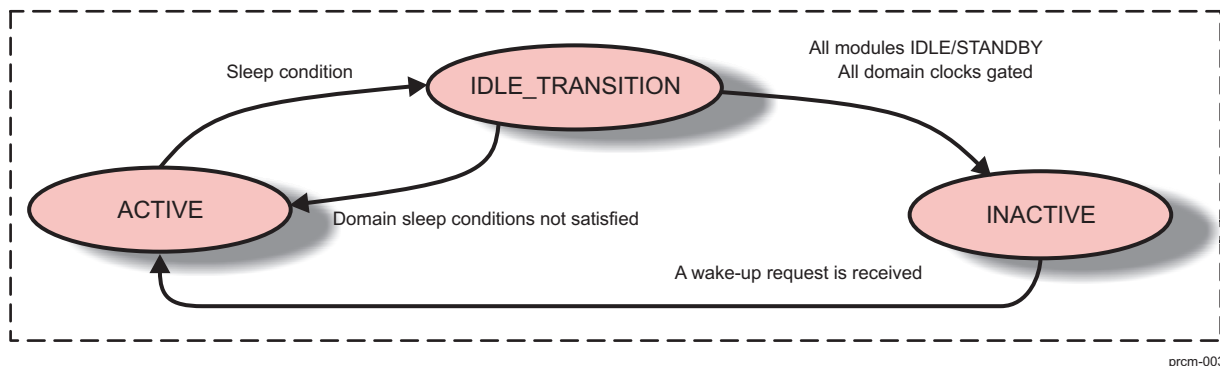

Table 8-7. Clock Domain Functional Clock States

CLKACTIVITY BIT Value	Status	Description
0x0	Gated	The functional clock of the clock domain is inactive
0x1	Active	The functional clock of the clock domain is running

8.1.3.3.1 Clock Domain-Level Clock Management

The domain clock manager can automatically (that is, based on hardware conditions) and jointly manage the interface clocks within the clock domain. The functional clocks within the clock domain are managed through software settings. A clock domain can switch between three possible states: ACTIVE, IDLE\_TRANSITION, and INACTIVE. Figure 8-3 shows the sleep and wake-up transitions of the clock domain between ACTIVE and INACTIVE states.

Figure 8-3. Clock Domain State Transitions

**Table 8-8. Clock Domain States**

State	Description
ACTIVE	<p>Every nondisabled slave module (that is, those whose MODULEMODE value is not set to disabled) is put out of IDLE state.</p> <p>All interface clocks to the nondisabled slave modules in the clock domain are provided. All functional and interface clocks to the active master modules (that is, not in STANDBY) in the clock domain are provided. All enabled optional clocks to the modules in the clock domain are provided.</p>
IDLE_TRANSITION	<p>This is a transitory state.</p> <p>Every master module in the clock domain is in STANDBY state. Every idle request to all the slave modules in the clock domain is asserted. The functional clocks to the slave module in enabled state (that is, those whose MODULEMODE values are set to enabled) remain active.</p> <p>All enabled optional clocks to the modules in the clock domain are provided.</p>
INACTIVE	<p>All clocks within the clock domain are gated.</p> <p>Every slave module in the clock is in IDLE state and set to disabled.</p> <p>Every slave module in the clock domain (that is, those whose MODULEMODE is set to disabled) is in IDLE state and set to disabled.</p> <p>Every optional functional clock in the clock domain is gated</p>

Each clock domain transition behavior is managed by an associated register bit field in the CM\_<Clock domain>\_CLKSTCTRL[x] CLKTRCTRL PRCM module

**Table 8-9. Clock Transition Mode Settings**

CLKTRCTRL Bit Value	Selected Mode	Description
0x0	NO_SLEEP	Sleep transition cannot be initiated. Wakeup transition may however occur.
0x1	SW_SLEEP	A software-forced sleep transition. The transition is initiated when the associated hardware conditions are satisfied
0x2	SW_WKUP	A software-forced clock domain wake-up transition is initiated
0x3	Reserved	NA

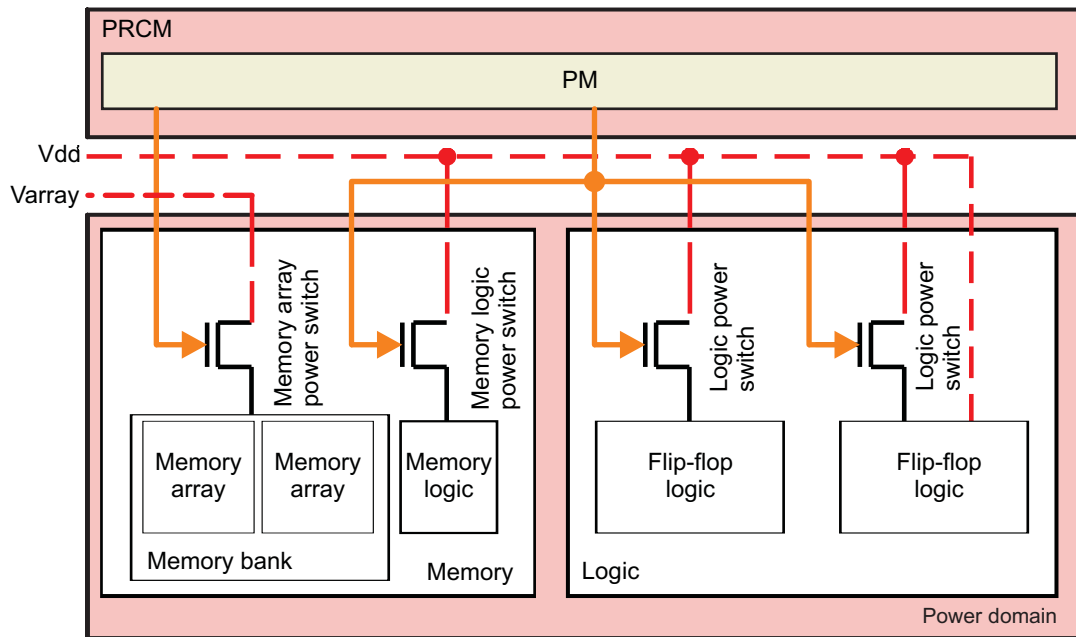

## 8.1.4 Power Management

The PRCM module manages the switching on and off of the power supply to the device modules. To minimize device power consumption, the power to the modules can be switched off when they are not in use. Independent power control of sections of the device allows the PRCM module to turn on and off specific sections of the device without affecting the others.

### 8.1.4.1 Power Domain

A power domain is a section (that is, a group of modules) of the device with an independent and dedicated power manager (see Figure). A power domain can be turned on and off without affecting the other parts of the device.

Figure 8-4. Generic Power Domain Architecture

prcm-008

To minimize device power consumption, the modules are grouped into power domains. A power domain can be split into a logic area and a memory area.

Table 8-10. States of a Memory Area in a Power Domain

State	Description
ON	The memory array is powered and fully functional
OFF	The memory array is powered down

Table 8-11. States of a Logic Area in a Power Domain

State	Description
ON	Logic is fully powered
OFF	Logic power switches are off. All the logic (DFF) is lost

### 8.1.4.2 Power Domain Management

The power manager associated with each power domain is assigned the task of managing the domain power transitions. It ensures that all hardware conditions are satisfied before it can initiate a power domain transition from a source to a target power state

**Table 8-12. Power Domain Control and Status Registers**

Register/Bit Field	Type	Description
PM_<Power domain>_PWRSTCTRL[1:0] POWERSTATE	Control	Selects the target power state of the power domain among OFF, ON, or RETENTION.
PM_<Power domain>_PWRSTST[1:0] POWERSTATEST	Status	Identifies the current state of the power domain. It can be OFF, ON, or RETENTION.
PM_<Power domain>_PWRSTST[2] LOGICSTATEST	Status	Identifies the current state of the logic area in the power domain. It can be OFF or ON.
PM_<Power domain>_PWRSTST[5:4] MEMSTATEST	Status	Identifies the current state of the memory area in the power domain. It can be OFF, ON, or RETENTION

#### 8.1.4.2.1 Power-Management Techniques

The following section describes the state-of-the-art power-management techniques supported by the device.

##### 8.1.4.2.1.1 Adaptive Voltage Scaling

AVS is a power-management technique based in Smart Reflex that is used for automatic control of the operating voltages of the device to reduce active power consumption. With Smart Reflex, power-supply voltage is adapted to silicon performance, either statically (based on performance points predefined in the manufacturing process of a given device) or dynamically (based on the temperature-induced real-time performance of the device). A comparison of these predefined performance points to the real-time on-chip measured performance determines whether to raise or lower the power-supply voltage. AVS achieves the optimal performance/power trade-off for all devices across the technology process spectrum and across temperature variation. The device voltage is automatically adapted to maintain performance of the device

### 8.1.4.3 Power Modes

The following is a high-level description of the different power modes of the device. They are listed in order from highest power consumption, lowest wakeup latency (Standby), to lowest power consumption, highest wakeup latency (RTC-only). If your application requires some sort of power management, you must determine which power mode level described below satisfies your requirements. Each level must be evaluated based on power consumed and latency (the time it takes to wakeup to Active mode). Specific values are detailed in the device-specific data sheet. Note that not all modes are supported by software packages supplied by Texas Instruments.

**Table 8-13. Typical Power Modes**

Power Modes	Application State	Power Domains, Clocks, and Voltage Supply States
Active	All Features	<p><b>Power supplies:</b> All power supplies are ON. VDD_MPU = 1.1 V (nom) VDD_CORE = 1.1 V (nom)</p> <p><b>Clocks:</b> Main Oscillator (OSC0) = ON All DPLLs are locked.</p> <p><b>Power domains:</b> PD_PER = ON PD_MPU = ON PD_GFX = ON or OFF (depending on use case) PD_WKUP = ON DDR is active.</p>
Standby	DDR memory is in self-refresh and contents are preserved. Wakeup from any GPIO. CortexA8 context/register contents are lost and must be saved before entering standby. On exit, context must be restored from DDR. For wakeup, boot ROM executes and branches to system resume.	<p><b>Power supplies:</b> All power supplies are ON. VDD_MPU = 0.95 V (nom) VDD_CORE = 0.95 V (nom)</p> <p><b>Clocks:</b> Main Oscillator (OSC0) = ON All DPLLs are in bypass.</p> <p><b>Power domains:</b> PD_PER = ON PD_MPU = OFF PD_GFX = OFF PD_WKUP = ON DDR is in self-refresh.</p>
Deepsleep1	On-chip peripheral registers are preserved. Cortex-A8 context/registers are lost, so the application needs to save them to the L3 OCMC RAM or DDR before entering DeepSleep. DDR is in self-refresh. For wakeup, boot ROM executes and branches to system resume.	<p><b>Power supplies:</b> All power supplies are ON. VDD_MPU = 0.95 V (nom) VDD_CORE = 0.95 V (nom)</p> <p><b>Clocks:</b> Main Oscillator (OSC0) = OFF All DPLLs are in bypass.</p> <p><b>Power domains:</b> PD_PER = ON PD_MPU = OFF PD_GFX = OFF PD_WKUP = ON DDR is in self-refresh.</p>

**Table 8-13. Typical Power Modes (continued)**

Power Modes	Application State	Power Domains, Clocks, and Voltage Supply States
Deepsleep0	PD_PER peripheral and Cortex-A8/MPU register information will be lost. On-chip peripheral register (context) information of PD-PER domain needs to be saved by application to SDRAM before entering this mode. DDR is in self-refresh. For wakeup, boot ROM executes and branches to peripheral context restore followed by system resume.	<b>Power supplies:</b> All power supplies are ON. VDD_MPU = 0.95 V (nom) VDD_CORE = 0.95 V (nom) <b>Clocks:</b> Main Oscillator (OSC0) = OFF All DPLLs are in bypass. <b>Power domains:</b> PD_PER = OFF PD_MPU = OFF PD_GFX = OFF PD_WKUP = ON DDR is in self-refresh.
RTC-Only	RTC timer remains active and all other device functionality is disabled.	<b>Power supplies:</b> All power supplies are OFF except VDDS_RTC. VDD_MPU = 0 V VDD_CORE = 0 V <b>Clocks:</b> Main Oscillator (OSC0) = OFF <b>Power domains:</b> All power domains are OFF.

#### 8.1.4.3.1 Active

In Active mode, the supply to all voltage rails must be maintained. All power domains come up in ON state and the device is fully functional.

#### 8.1.4.3.2 Standby

The device can be placed in Standby mode to reduce power consumption during low activity levels. This first level of power management allows you to maintain the device context for fast resume times. The main characteristics of this mode which distinguish it from Active mode are:

- All modules are clock gated except GPIOs
- PLLs may be placed in bypass mode if downstream clocking does not require full performance
- Voltage domains VDD\_MPU and VDD\_CORE voltage levels can be reduced to OPP50 levels because the required performance of the entire device is reduced
- MPU power domain (PD\_MPU) is in OFF state
- DDR memory is in low power self-refresh mode.

Further power reduction can be achieved in this mode if the RTC function is not required. See [Section 8.1.4.3.6, Internal RTC LDO](#).

The above conditions result in lower power consumption than Active mode but require the user to save the MPU context to OCMC RAM or DDR to resume properly upon wakeup. Contents of the internal SRAM are lost because PD\_MPU is turned OFF. Wakeup in Standby mode is achieved using any GPIO. GPIO wakeup is possible by switching the pad to GPIO mode and configuring the corresponding GPIO bank for generating an interrupt to the MPUSS. Note that pads that do not have a GPIO muxmode (for example, ADC or USB), cannot cause these wakeups. If additional or other wakeup sources are required, the associated peripheral module clock and interconnect clock domain should remain enabled (this may require the associated PLL to remain locked) and the module must be configured appropriately for wakeup by configuring it to generate an interrupt to the MPUSS.

### 8.1.4.3.3 *Deepsleep1*

DeepSleep1 mode enables lower power consumption than Standby mode. The main characteristic of this mode which distinguishes it from Standby mode is the main oscillator (OSC0) is disabled.

DeepSleep1 is the lowest sleep mode required for certain USB wakeup modes. See [Section 8.1.4.3.7, Supported Low Power USB Wakeup Scenarios](#), for more information.

Further power reduction can be achieved in this mode if the RTC function is not required. See [Section 8.1.4.3.6, Internal RTC LDO](#).

Similar to Standby mode, the contents of the internal SRAM are lost because PD\_MPU is turned OFF. In addition, the contents of the SDRAM are preserved by placing the SDRAM in self-refresh. Activity on wakeup peripherals via wake-up events enables the master crystal oscillator using the oscillator control circuit. The wakeup events also interrupt CortexM3. See [Section 8.1.4.5, Wakeup Sources/Events](#), for details on wakeup sources.

### 8.1.4.3.4 *Deepsleep0*

DeepSleep0 mode enables lower power consumption than DeepSleep1. The main characteristics of the mode which distinguish it from other higher power modes are:

- All on-chip power domains are shut off (except PD\_WKUP and PD\_RTC remain ON) to reduce power leakage
- VDD\_CORE power (except VDDA analog) to DPLLs is turned OFF using `dp11_pwr_sw_ctrl` register (PG 2.x only)
- VDDS\_SRAM\_CORE\_BG is in retention using `SMA2.vslldo_core_auto_ramp_en` (PG2.x only)

DeepSleep0 mode is typically used during periods of inactivity when the user requires very low power while waiting for an event that requires processing or higher performance. This is the lowest power mode which still includes DDR in self-refresh, so wakeup events do not require a full cold boot, which greatly reduces wakeup latencies over RTC-only mode.

Further power reduction can be achieved in this mode if the RTC function is not required. See [Section 8.1.4.3.6, Internal RTC LDO](#).

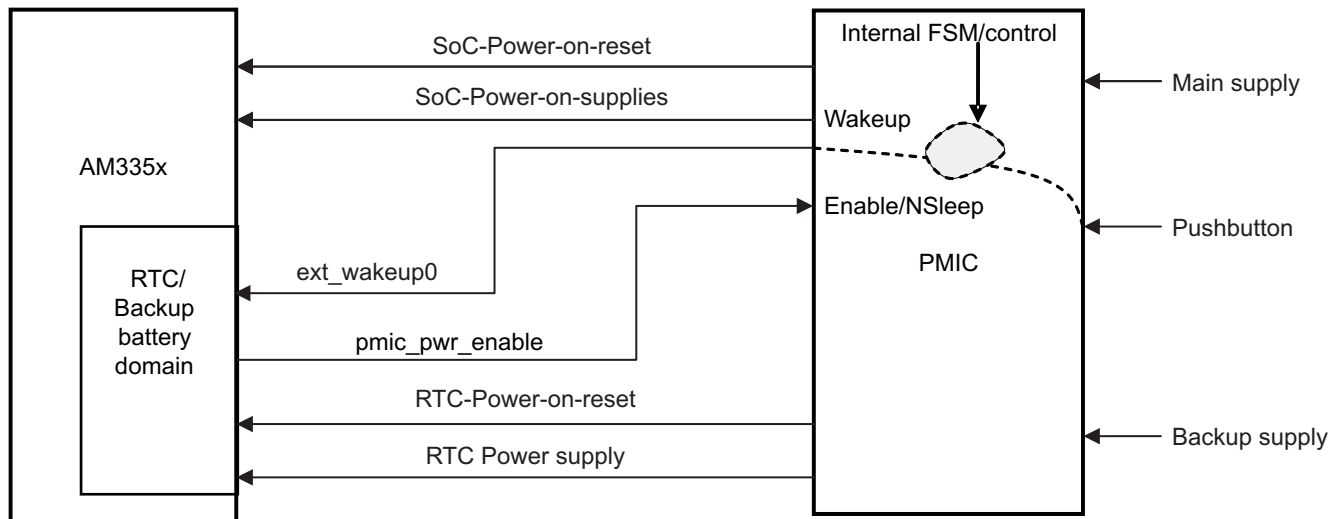

Before entering DeepSleep0 mode, peripheral and MPU context must be saved in the DDR. Upon wakeup, the boot ROM executes and checks to see if it has resumed from a DeepSleep0 state. If so, it redirects to the DDR to continue the resume process. Because power to PD\_WKUP is ON throughout DeepSleep0, power to key modules such as GPIO0, I2C, and others is maintained to allow wakeup events to exit out of this mode. In addition, power to OCMC RAM is maintained to preserve information internally during DeepSleep0.

Activity on wakeup peripherals via wakeup events enables the master crystal oscillator using the oscillator control circuit. The wakeup events also interrupt CortexM3 which controls proper enabling of power domains and clocks in the PRCM. See [Section 8.1.4.5, Wakeup Sources/Events](#), for details on wakeup sources during DeepSleep0 and other low power modes mentioned.

### 8.1.4.3.5 *RTC-Only*

RTC-only mode is an ultra-low power mode which allows the user to maintain power and clocks to the real-time clock (RTC) domain while the rest of the device is powered down. All context and memories will be lost, and the only portion of the chip that will be maintained is the RTC. Only the RTC power supply must be ON. All the remaining supplies must be OFF. The RTC battery backup domain consists of the RTC subsystem (RTCSS), a dedicated, on-chip 32.768 Hz crystal oscillator and I/Os associated with the RTCSS: `pmic_power_en` and `ext_wakeup`.

[Figure 8-5](#) gives a high level view of system which implements the RTC-only mode.

**Figure 8-5. High Level System View for RTC-only Mode**

Wakeup from RTC-only mode can only be achieved using the `ext_wakeup0` signal. Once a wakeup is triggered using this signal, the device drives `pmic_pwr_enable` to initiate a power-up sequence by the PMIC. The device must go through a full cold boot upon wakeup from RTC-only mode.

#### 8.1.4.3.6 Internal RTC LDO

The device contains an internal LDO (low dropout) regulator which powers the RTC digital core. Depending on your application, you may be able to disable this regulator to save power in low power use cases.

If your application never uses the RTC functionality, connect `RTC_KALDO_ENn` to `VDDS_RTC`, `CAP_VDD_RTC` to `VDD_CORE`, and `RTC_PWRONRSTn` to ground. These connections disable the internal RTC LDO because `RTC_KALDO_ENn` is high, and they use the external `VDD_CORE` supply to power the RTC digital core. The RTC LDO must be disabled for internal power sequencing even though the RTC is not used. Grounding the reset signal will ensure the RTC stays in reset. Disabling the internal LDO will allow the application to achieve lower power consumption in all the low power modes.

If your application uses the RTC functionality and never needs RTC-only mode, the hardware scenario is similar to the previous description, but the RTC reset signal must be connected to the device `PWRONRSTn`. This connection allows full functionality of the RTC subsystem without the internal RTC LDO consuming power.

If your application uses the RTC functionality and requires RTC-only mode, the internal LDO is required to enable proper wakeup signaling from the RTC domain. The proper wakeup signaling requires the following connections:

- `RTC_KALDO_ENn` is grounded
- `CAP_VDD_RTC` is connected to 1uF decoupling capacitor to ground
- `RTC_PWRONRSTn` is connected to 1.8V RTC power on reset
- `PMIC_POWER_EN` is connected to power input of PMIC
- `EXT_WAKEUP0` is connected to a wakeup source

See the device datasheet for more information on these signals.

### 8.1.4.3.7 Supported Low Power USB Wakeup Scenarios

Table 8-14 summarizes different USB wakeup use cases which are supported in each system sleep state (DeepSleep0, DeepSleep1, or Standby). Three use case scenarios exist:

- USB Connect: Wakeup is caused by physically inserting the USB cable.
- USB Disconnect: Wakeup is caused by physically removing the USB cable.
- USB Suspend/Resume: Wakeup is caused by a USB suspend or resume command. For example, a USB mouse click can cause a USB resume command.

Within each wakeup use case, each row describes whether or not that type of wakeup is supported in each system sleep mode. USB mode (host or device) is also considered.

There are two possible Wakeup events that are generated:

- PHY WKUP: this is an internal wakeup signal to the CortexM3 that is generated by the USB PHY based off of USB signaling.
- VBUS2GPIO: this is an external wakeup signal coming from a level change on VBUS voltage. This event requires an external board solution which routes VBUS to a GPIO on the device. Ensure you level shift the voltage to conform to the I/O requirements. When VBUS transitions from 0V to 5V (or vice versa), the transition on a GPIO will trigger a wakeup.

**Table 8-14. USB Wakeup Use Cases Supported in System Sleep States**

No.	USB Wakeup Use Case	System Sleep State	USB Controller State	USB Mode	Supported	USB Wakeup Event
1	USB Connect	DS0	POWER OFF	Host	No	N/A
2		DS0	POWER OFF	Device	Yes	VBUS2GPIO
3		DS1/ Standby	Clock Gated	Host	Yes	PHY WKUP
4		DS1/ Standby	Clock Gated	Device	Yes	VBUS2GPIO
5	USB Suspend / Resume	DS0	POWER OFF	Host	No	N/A
6		DS0	POWER OFF	Device	No	N/A
7		DS1/ Standby	Clock Gated	Host	Yes	PHY WKUP
8		DS1/ Standby	Clock Gated	Device	Yes	PHY WKUP
9	USB Disconnect	DS0	POWER OFF	Host	No	N/A
10		DS0	POWER OFF	Device	No	N/A
11		DS1/ Standby	Clock Gated	Host	Yes	PHY WKUP
12		DS1/ Standby	Clock Gated	Device	Yes	VBUS2GPIO

### 8.1.4.4 Main Oscillator Control During Deep Sleep

The DeepSleep oscillator circuit is used to control the main oscillator by disabling it during deep sleep and enabling during active/wakeup. By default during reset, the oscillator is enabled and the oscillator control circuit comes up disabled (in-active). In order to activate the oscillator control circuit for deepsleep, DSENABLE bit of DEEPSLEEP\_CTRL register must set. Once this is set and whenever wake M3 enters standby, the oscillator control will disable the oscillator causing the clock to be shut OFF. Any async event from the wakeup sources will cause the oscillator control to re-enable the oscillator after a period of DSCOUNT configured in DEEPSLEEP\_CTRL register.

#### 8.1.4.5 Wakeup Sources/Events

Following events will wake up the device from Deep sleep(low power) modes. These are part of the Wakeup Power domain and remain always ON.

**Note:** For differences in operation based on AM335x silicon revision, see [Section 1.2, Silicon Revision Functional Differences and Enhancements](#).

- GPIO0 bank
- dmtimer1\_1ms (timer based wakeup)
- USB2PHY (USB resume signaling from suspend) – Both USB ports supported.
- TSC (touch screen controller, ADC monitor functions )
- UART0 (Infra-red support)
- I2C0
- RTC alarm

These wake events apply on any of the deep sleep modes and standby mode.

#### 8.1.4.6 Functional Sequencing for Power Management with Cortex M3

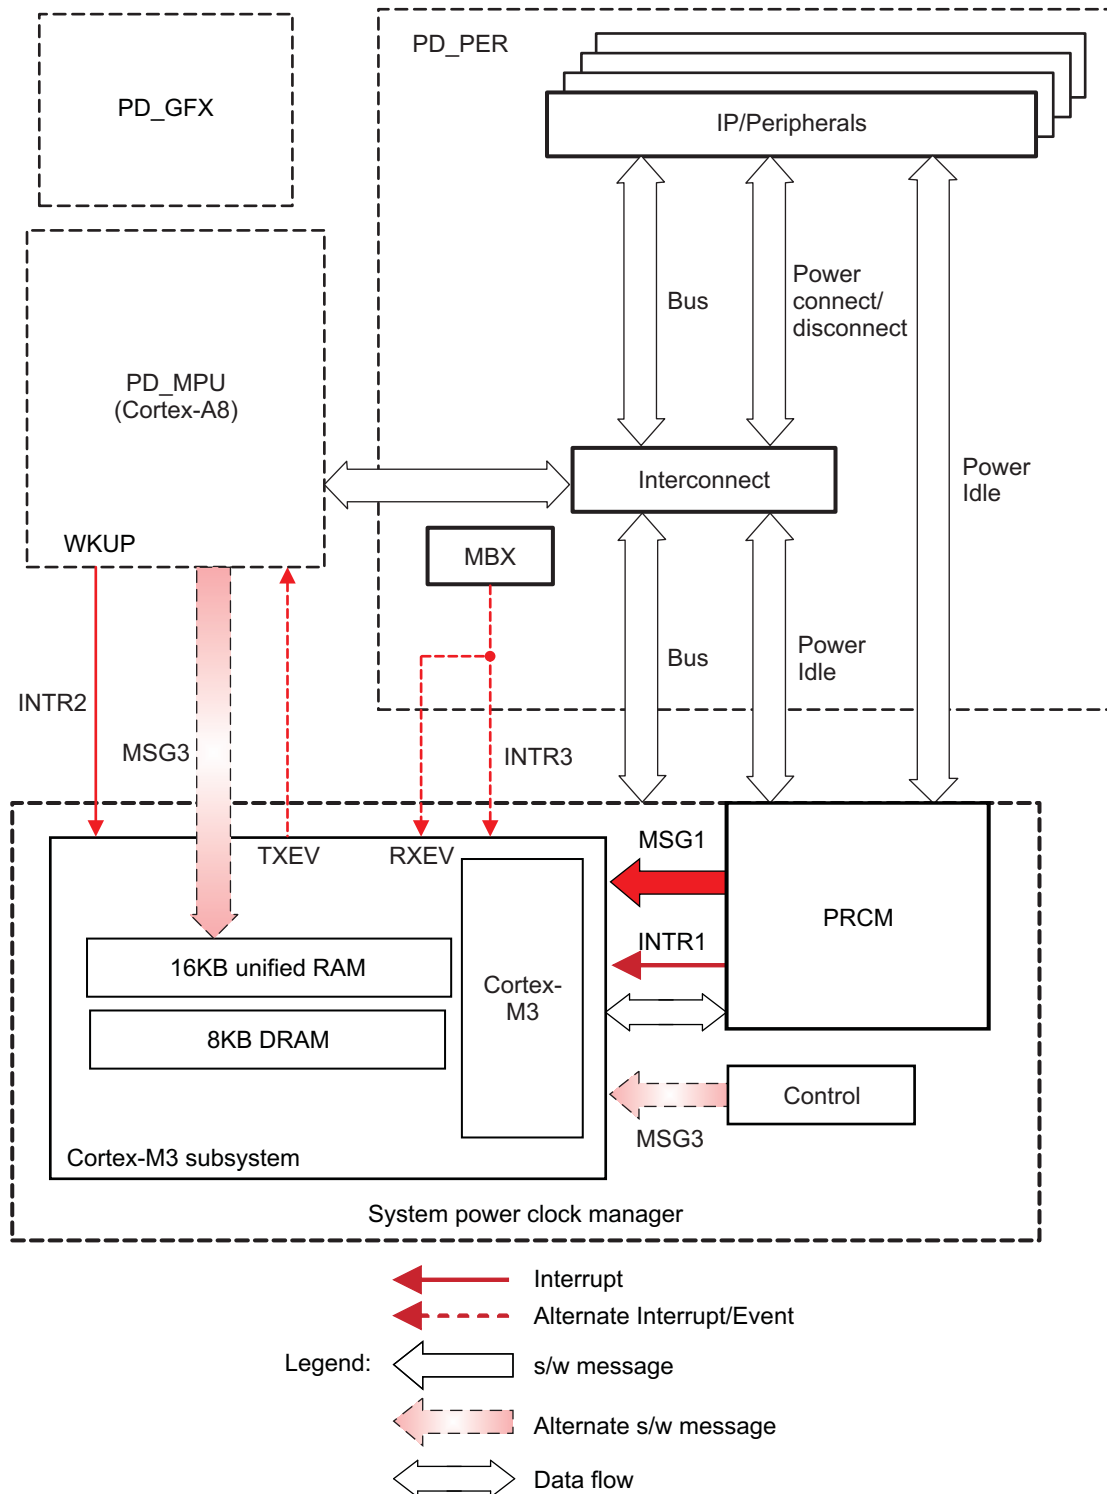

The AM335x device contains a dedicated Cortex M3 processor to handle the power management transitions. It is part of the Wake up Power domain (PD\_WKUP). Implementing the Power modes are part of the MPU and Cortex A8 processors.

The power management sequence kicks off with Cortex A8 MPU executing a WFI instruction with the following steps:

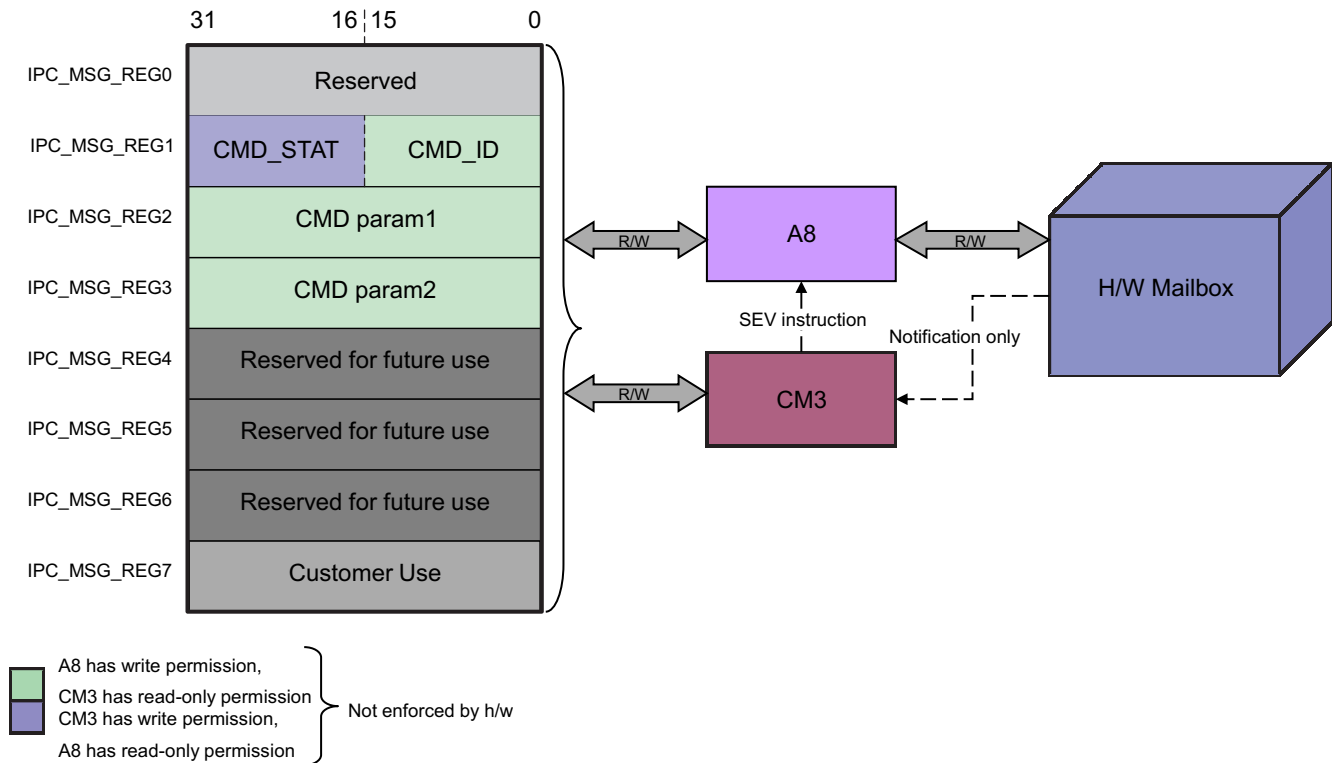

1. During Active power mode, the Cortex A8 MPU executes a WFI instruction to enter IDLE mode.
2. Cortex M3 gets an interrupts and gets active, It powers down the MPU power domain( if required).
3. Registers interrupt for the Wake up peripheral(which is listed in Wake up sources in previous section).
4. Executes WFI and goes into idle state.
5. The wake up event triggers an interrupt to Cortex M3 system and it wakes up the Cortex A8 MPU.

Generally, A8 and CortexM3 are not expected to be active at the same time CortexM3 along with PRCM is the power manager primarily for PD\_MPU and PD\_PER. Other power domains (e.g., PD\_GFX) may be handled directly using Cortex A8 MPU software. [Figure 8-6](#) gives a system level view of the Power management system between Cortex A8 MPU and Cortex M3.

Figure 8-6. System Level View of Power Management of Cortex A8 MPU and Cortex M3

The Cortex-M3 handles all of the low-level power management control of the AM335x. A firmware binary is provided by Texas Instruments that includes all of the necessary functions to achieve low power modes. Inter-Processor Communication (IPC) registers (`ipc_msg_regx`, located in the [Control Module Registers](#)) are available to communicate with the Cortex-M3 so the user can provide certain configuration parameters based on the level of low power that is required. [Figure 8-7](#) provides a mapping of these registers.

**Figure 8-7. IPC Mechanism**

IPC\_MSG\_REG1 contains the CMD\_STAT and CMD\_ID parameters as described in [Table 8-15](#) and [Table 8-16](#).

**Table 8-15. CMD\_STAT Field**

CMD_STAT	Value	Description
PASS	0x1	In the initialization phase, PASS (0x1) denotes that the CM3 was successfully initialized.
IN_PROGRESS	0x2	Early indication of command being carried out.
FAIL	0x3	In the initialization phase, 0x2 denotes CM3 could not properly initialize. When other tasks are to be done, FAIL (0x3) indicates some error in carrying out the task. Check trace vector for details.
WAIT4OK	0x4	CM3 INTC will catch the next WFI of A8 and continue with the pre-defined sequence.

**Table 8-16. CMD\_ID Field**

CMD_ID	Value	Description
CMD_RTC	0x1	<ol style="list-style-type: none"> <li>1. Initiates force_sleep on interconnect clocks.</li> <li>2. Turns off MPU and PER power domains.</li> <li>3. Programs the RTC alarm register for deasserting pmic_pwr_enable.</li> </ol>
CMD_RTC_FAST	0x2	Programs the RTC alarm register for deasserting pmic_pwr_enable.
CMD_DS0	0x3	<ol style="list-style-type: none"> <li>1. Initiates force_sleep on interconnect clocks.</li> <li>2. Turns off the MPU and PER power domains.</li> <li>3. Configures the system for disabling MOSC when CM3 executes WFI.</li> </ol>
CMD_DS1	0x5	<ol style="list-style-type: none"> <li>1. Initiates force_sleep on interconnect clocks.</li> <li>2. Turns off the MPU power domains.</li> <li>3. Configures the system for disabling MOSC when CM3 executes WFI.</li> </ol>

#### **8.1.4.6.1 Periodic Idling of Cortex A8 MPU**

To implement Cortex A8 MPU periodic ON/OFF in the use case, the control flow could be implemented according to the following steps:

1. Cortex A8 MPU executes WFI instruction
2. Any peripheral interrupt in any of the next steps will trigger a wake interrupt to CortexM3 via MPU Subsystem's WKUP signal (INTR2 shown on the diagram). Cortex M3 powers down the MPU(PD\_MPU)
3. On receiving an interrupt Cortex M3 switches ON the MPU power domain by turning on PD\_MPU
4. Cortex M3 goes into idle mode using WFI instruction

#### **8.1.4.6.2 Sleep Sequencing**

This section gives the system level guidelines for sleep sequencing. The guidelines can serve as an example for implementing the sleep mode sequencing. The user can opt to implement a sequence with certain steps interchanged between the MPU and Cortex M3 processor.

1. Application saves context of peripherals to memories supporting retention and DDR – this step is only required for DeepSleep0.
2. MPU OCMC\_RAM remains in retention
3. Unused power domains are turned OFF - program clock/power domains PWRSTCTRL, save contexts etc
4. Software populates L3\_OCMC\_RAM for wakeup restoration viz Save EMIF settings, public restoration pointers, etc.
5. Execute WFI from SRAM
6. Any peripheral interrupt will trigger a wake interrupt to CortexM3 via Cortex A8 MPU's WKUP signal (INTR2 shown on the diagram).
7. After MPU power domain is clock gated PRCM will provide an interrupt to CortexM3 (using INTR1 shown in the block diagram)
8. CortexM3 starts execution and performs low level power sequencing to turn off certain power domain, and eventually executes WFI.
9. Hardware oscillator control circuit disables the oscillator once CortexM3 goes into WFI

#### **8.1.4.6.3 Wakeup Sequencing**

This section gives the guidelines for Wakeup sequencing.

1. One of the wakeup event triggers (which was configured during the sleep sequencing) will initiate a wakeup sequence
2. The wake up event will switch on the oscillator (if it was configured to go OFF during sleep)
3. The wake up event will also trigger interrupt to Cortex M3
4. On the wakeup event due to interrupt Cortex M3 execute the following
  - Restore the voltages to normal Operating voltage
  - Enable PLL locking
  - Cortex M3 will switch ON the power domains and/or enable clocks for PD\_PER
  - Cortex M3 will switch ON the power domains and/or enable clocks for PD\_MPU
  - Executes WFI
5. Cortex A8 MPU starts executing from ROM reset vector
6. Restore the application context(only for Deep sleep 0)

### **8.1.5 PRCM Module Overview**

The PRCM is structured using the architectural concepts presented in the 5000x Power Management Framework. This framework provides:

A set of modular, re-usable FSM blocks to be assembled into the full clock and power management mechanism. A register set and associated programming model. Functional sub-block definitions for clock management, power management, system clock source generation, and master clock generation.

The device supports an enhanced power management scheme based on four functional power domains:

#### Generic Domains

- WAKEUP
- MPU
- PER
- RTC

The PRCM provides the following functional features:

- Software configurable for direct, automatic, or a combination thereof, functional power domain state transition control
- Device power-up sequence control
- Device sleep / wake-up sequence control
- Centralized reset generation and management
- Centralized clock generation and management

The PRCM modules implement these general functional interfaces:

- OCP configuration ports
- Direct interface to device boundary
- Power switch control signals
- Device control signals
- Clocks control signals
- Resets signals
- A set of power management protocol signals for each module to control and monitor standby, idle and wake-up modes (CM and PRM)
- Emulation signals

### 8.1.5.1 Interface Descriptions

This section lists and shortly describes the different interfaces that allow PRCM to communicate with other modules or external devices.

#### 8.1.5.1.1 OCP Interfaces

The PRCM has 1 target OCP interfaces, compliant with respect to the OCP/IP2 standard. The OCP port, for the PRCM module is used to control power, reset and wake-up Management.

#### 8.1.5.1.2 OCP Slave Interfaces

PRCM implements a 32-bit OCP target interface compliant to the OCP/IP2.0 standard.

#### 8.1.5.1.3 Power Control Interface

The Device does has power domain switches over the device, this interface provides PRCM control over power domain switches and receives responses from the power domains which indicate the switch status. It also controls the isolation signals. The control for power domain switches will be latched in PRCM Status Registers

#### 8.1.5.1.4 Device Control Interface

This interface provides PRM management of several device-level features which are not specific to any single power domain. This PRM interface controls signals to/from the device for global control:

- Device Type coding
- IOs isolation control

#### 8.1.5.1.5 Clocks Interface

This interface gathers all clock inputs and outputs managed by PRCM modules.

#### 8.1.5.1.6 Resets Interface

This interface gathers all resets inputs and outputs managed by PRCM module.

#### 8.1.5.1.7 Modules Power Management Control Interface

Modules or subsystems in the device are split over 2 categories:

- Initiator: an initiator is a module able to generate traffic on the device interconnects (typically: processors, MMU, EDMA).
- Target: a target is a module that cannot generate traffic on the device interconnects, but that can generate interrupts or DMA request to the system (typically: peripherals). PRCM handles a power management handshake protocol with each module or sub-system. This protocol allows performing proper clock and power transition taking into account each module activity or state.

#### 8.1.5.1.8 Initiator Modules Interface

PRCM module handle all initiator modules power management interfaces: MStandby signal MWait signal

#### 8.1.5.1.9 Targets Modules Interface

PRCM module handle all target modules power management interfaces: SIdleReq signal SIdleAck signal FCLKEN signal

**Note:** USB Support for SWakeUp

### 8.1.6 Clock Generation and Management

PRCM provides a centralized control for the generation, distribution and gating of most clocks in the device. PRCM gathers external clocks and internally generated clocks for distribution to the other modules in the device. PRCM manages the system clock generation

#### 8.1.6.1 Terminology

The PRCM produces 2 types of clock:

**Interface clocks:** these clocks primarily provide clocking for the system interconnect modules and the portions of device's functional modules which interface to the system interconnect modules. In most cases, the interface clock supplies the functional module's system interconnect interface and registers. For some modules, interface clock is also used as functional clock. In this document, interface clocks are represented by blue lines.

**Functional clock:** this clock supplies the functional part of a module or a sub-system. In some cases, a module or a subsystem may require several functional clocks: 1 or several main functional clock(s), 1 or several optional clock(s). A module needs its main clock(s) to be operational. Optional clocks are used for specific features and can be shutdown without stopping the module

#### 8.1.6.2 Clock Structure

To generate high-frequency clocks, the device supports multiple on-chip DLLs controlled directly by the PRCM module. They are of two types of PLLs, referred to ADPLLs and ADPLLJ throughout this document.

The ADPLLs module is used for the Core, Display, ARM Subsystem and DDR PLLs

The ADPLLJ module is used for the peripheral functional clocks

The device has two reference clocks which are generated by on-chip oscillators or externally. These are for the main clock tree and RTC block, respectively.

In the case of an external oscillator, a clock can directly be connected to XTALIN pin and the oscillator will be put in bypass mode. The 32-Khz crystal oscillator is controlled and configurable by RTC IP. This device also contains an on-chip RC oscillator. This oscillator is not configurable and is always on.

The main oscillator on the device (see [Chapter 26, Initialization](#), for possible frequencies) produces the master high frequency clock CLK\_M\_OSC.

### 8.1.6.3 ADPLLs

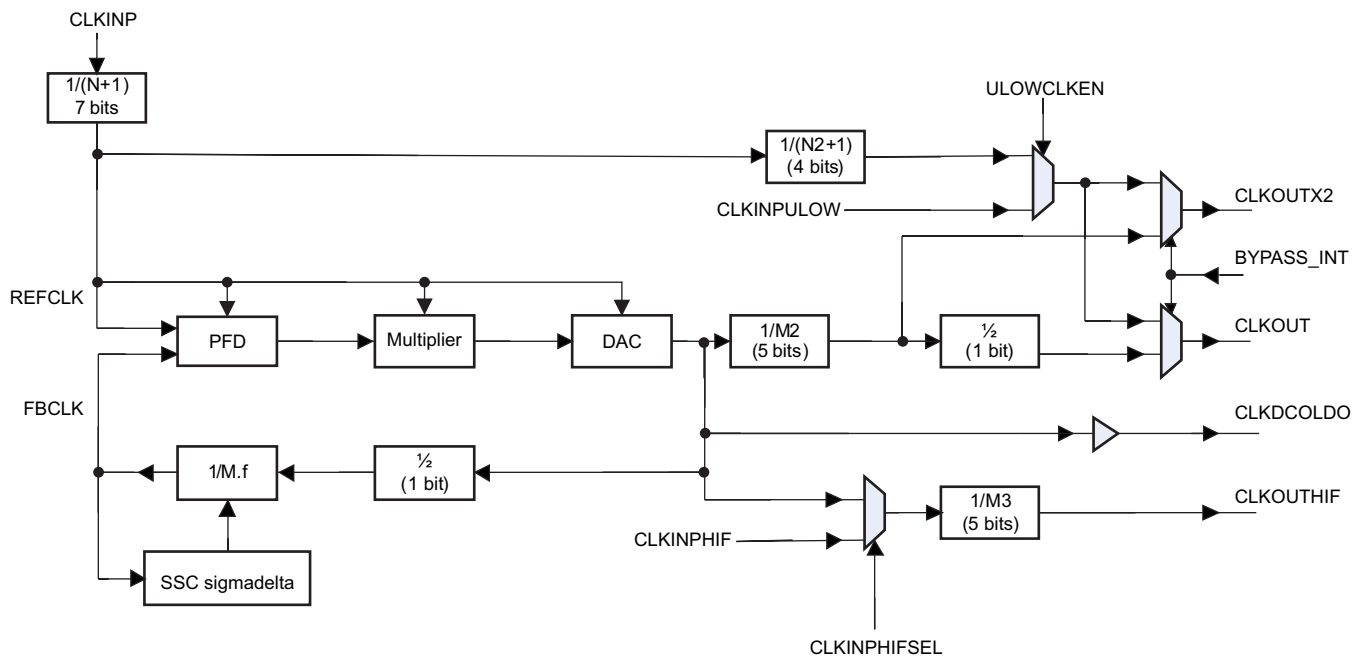

The ADPLLs is a high resolution frequency synthesizer PLL with built in level shifters which allows the generation of PLL locked frequencies up to 2 GHz. ADPLLs has a predivide feature which allows user to divide, for instance, a 24- or 26-MHz reference clock to 1-MHz and then multiply up to 2-GHz maximum.

All PLLs will come-up in bypass mode at reset. SW needs to program all the PLL settings appropriately and then wait for PLL to be locked. For more details, see the configuration procedure for each PLL.

The following PLLs are:

- MPU PLL
- Core PLL
- Display PLL
- DDR PLL

**Figure 8-8. ADPLLs**

The ADPLLs has three input clocks:

- CLKINP: Reference input clock
- CLKINPULOW: Low frequency input clock for bypass mode only.
- CLKINPHIF: High Frequency Input Clock for post-divider M3

The ADPLLs has four output clocks:

- CLKOUTHIF: High Frequency Output Clock from Post divider M3
- CLKOUTX2: Secondary 2x Output
- CLKOUT: Primary output clock
- CLKDCOLDO: Oscillator (DCO) output clock with no bypass

The DPLL has two internal clocks:

- REFCLK (Internal reference clock): This is generated by dividing the input clock CLKINP by the programmed value N+1. The entire loop of the PLL runs on the REFCLK.  
Here, REFCLK = CLKINP/(N+1).
- BCLK: Bus clock which is used for programming the various settings using registers

The ADPLL lock frequency is defined as follows:  $f_{DPLL} = (M * CLKINP)/(N+1)$

### 8.1.6.3.1 Clock Functions

**Table 8-17. Output Clocks in Locked Condition**

Pin Name	Frequency	Comments
<b>REGM4XEN='0'</b>		
CLKOUT	$[M / (N+1)] * CLKINP * [1/M2]$	
CLKOUTX2	$2 * [M / (N+1)] * CLKINP * [1/M2]$	
CLKDCOLDO	$2 * [M / (N+1)] * CLKINP$	
CLKOUTHIF	CLKINPHIF / M3	CLKINPHIFSEL='1'
	$2 * [M / (N+1)] * CLKINP * [1/M3]$	CLKINPHIFSEL='0'
<b>REGM4XEN='1'</b>		
CLKOUT	$[4M / (N+1)] * CLKINP * [1/M2]$	
CLKOUTX2	$2 * [4M / (N+1)] * CLKINP * [1/M2]$	
CLKDCOLDO	$2 * [4M / (N+1)] * CLKINP$	
CLKOUTHIF	CLKINPHIF / M3	CLKINPHIFSEL='1'
	$2 * [4M / (N+1)] * CLKINP * [1/M3]$	CLKINPHIFSEL='0'

**Table 8-18. Output Clocks Before Lock and During Relock Modes**

Pin Name	Frequency	Comments
CLKOUT	CLKINP / (N2+1)	ULOWCLKEN='0'
	CLKINPULOW	ULOWCLKEN='1'
CLKOUTX2	CLKINP / (N2+1)	ULOWCLKEN='0'
	CLKINPULOW	ULOWCLKEN='1'
CLKDCOLDO	Low	
CLKOUTHIF	CLKINPHIF/M3	ULOWCLKEN='1'
	Low	ULOWCLKEN='0'

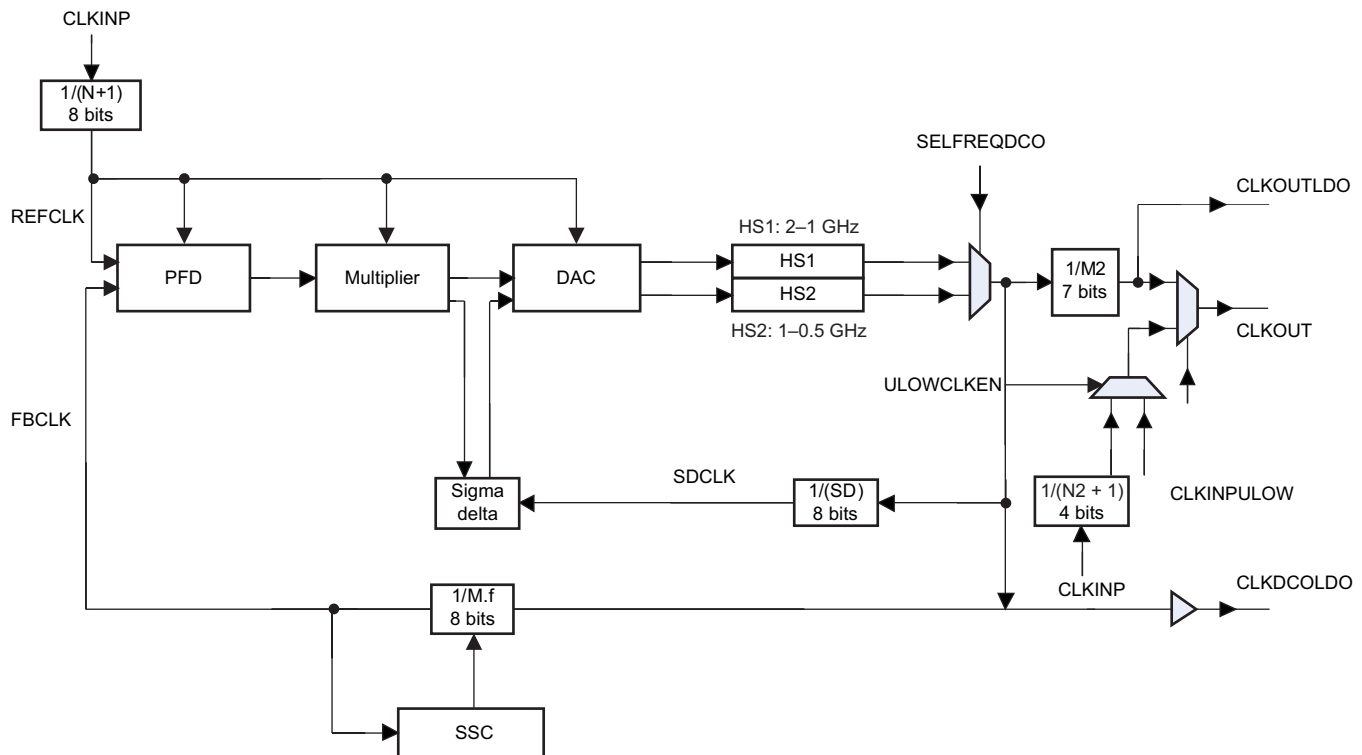

**Note:** Since M3 divider is running on the internal LDO domain, in the case when CLKINPHIFSEL='1', CLKOUTHIF could be active only when internal LDO is ON. Hence, whenever LDOPWDN goes low to high to powerdown LDO (happens when TINITZ activated / when entering slow relock bypass mode), output CLKOUTHIF will glitch and stop. To avoid this glitch, it is recommended to gate CLKOUTHIF using control CLKOUTHIFEN before asserting TINITZ / entering any slow relock bypass mode Frequency Range (MHz)

See the device-specific data manual for details on operating performance points (OPPs) supported by your device.

### 8.1.6.4 ADPLLLJ (Low Jitter DPLL)

The ADPLLLJ is a low jitter PLL with a 2-GHz maximum output. ADPLLLJ has a predivide feature which allows user to divide, for instance, a 24-MHz or 26-MHz reference clock to 1 MHz and then multiply up to 2 GHz maximum.

All PLLs will come-up in bypass mode at reset. SW needs to program all the PLL settings appropriately and then wait for PLL to be locked. For more details, see the configuration procedure for each PLL.

**Figure 8-9. Basic Structure of the ADPLLJ**

The Peripheral PLL belongs to type ADPLLJ:

The DPLL has two input clocks:

- CLKINP: Reference input clock
- CLKINPULOW: Bypass input clock.

The DPLL has two internal clocks:

- REFCLK (Internal reference clock): This is generated by dividing the input clock CLKINP by the programmed value N+1. The entire loop of the PLL runs on the REFCLK.  
Here,  $REFCLK = CLKINP / (N+1)$ .
- CLKDCO (Internal Oscillator clock.): This is the raw clock directly out of the digitally controlled oscillator (DCO) before the post-divider. The PLL output clock is synthesized by an internal oscillator which is phase locked to the refclk. There are two oscillators built within ADPLLJ. The oscillators are user selectable based on the synthesized output clock frequency requirement. In locked condition,  $CLKDCO = CLKINP * [M / (N+1)]$ .

The ADPLLJ lock frequency is defined as follows:  $f_{DPLL} = (M * CLKINP) / (N+1)$

The DPLL has three external output clocks:

- CLKOUTLDO: Primary output clock in VDDLDOOUT domain. Bypass option not available on this output.

$$CLKOUTLDO = (M / (N+1)) * CLKINP * (1/M2)$$

- CLKOUT:

Primary output clock on digital core domain

$$CLKOUT = (M / (N+1)) * CLKINP * (1/M2)$$

- CLKDCOLDO:

Oscillator (DCO) output clock before post-division in VDDLDOOUT domain. Bypass option is not available on this output.

$$CLKDCOLDO = (M / (N+1)) * CLKINP.$$

All clock outputs of the DPLL can be gated. The Control module provides the DPLL with a clock gating control signal to enable or disable the clock, and the DPLL provides the PRCM module with a clock activity status signal to let the PRCM module hardware know when the clock is effectively running or effectively gated. Output clock gating control for various clockouts: CLKOUTEN/CLKOUTLDOEN/CLKDCOLDOEN.

#### 8.1.6.4.1 Clock Functions

**Table 8-19. Output Clocks in Locked Condition**

Pin Name	Frequency
CLKOUT	$[M / (N+1)] * CLKINP * [1/M2]$
CLKOUTLDO	$[M / (N+1)] * CLKINP * [1/M2]$
CLKDCOOUT	$[M / (N+1)] * CLKINP$

**Table 8-20. Output Clocks Before Lock and During Relock Modes**

Pin Name	Frequency	Comments
CLKOUT	$CLKINP / (N2+1)$	ULOWCLKEN='0'
	CLKINPLOW	ULOWCLKEN='1'
CLKDCOLDO	LOW	
CLKOUTLDO	LOW	

#### 8.1.6.5 M2 and N2 Change On-the-Fly

The dividers M2 and N2 are designed to change on the fly and provide a glitch-free frequency switch from the old to new frequencies. In other words, they can be changed while the PLL is in a locked condition, without having to switch to bypass mode. A status toggle bit will give an indication if the new divisor was accepted. These dividers can also be changed in bypass mode, and the new divisor value will be reflected on output after the PLL relocks. For more details, see the PLL configuration procedures for each PLL.

#### 8.1.6.6 Spread Spectrum Clocking (SSC)

The module supports spread spectrum clocking (SSC) on its output clocks. SSC is used to spread the spectral peaking of the clock to reduce any electromagnetic interference (EMI) that may be caused due to the clock's fundamental or any of its harmonics. When SSC is enabled the clock's spectrum is spread by the amount of frequency spread, and the attenuation is given by the ratio of the frequency spread ( $\Delta f$ ) and the modulation frequency ( $f_m$ ), i.e.,  $[10 * \log_{10}(\Delta f / f_m)] - 10$  dB.

SSC is performed by changing the feedback divider (M) in a triangular pattern. Implying, the frequency of the output clock would vary in a triangular pattern. The frequency of this pattern would be modulation frequency ( $f_m$ ). The peak ( $\Delta M$ ) or the amplitude of the triangular pattern as a percent of M would be equal to the percent of the output frequency spread ( $\Delta f$ ); that is,  $\Delta M / M = \Delta f / f_c$ . Next mark with Finp the frequency of the clock signal at the input of the DPLL. Because it is divided to N+1 before entering the phase detector, so the internal reference frequency is  $F_{ref} = Finp / (N + 1)$ .

Assume the central frequency  $f_c$  to be equal to the DPLL output frequency Fout, or  $f_c = F_{out} = (Finp / (N + 1)) * (M / M2)$ . Since this is in band modulation for the DPLL, the modulation frequency is required to be within the DPLL's loop bandwidth (lowest BW of  $F_{ref} / 70$ ). A higher modulation frequency would result in lesser spreading in the output clock.

SSC can be enabled/disabled using bit CM\_CLKMODE\_DPLL\_xxx.DPLL\_SSC\_EN (where xxx can be any one of the following DPLLs: MPU, DDR, DISP, CORE, PER). An acknowledge signal CM\_CLKMODE\_DPLL\_xxx.DPLL\_SSC\_ACK notifies the exact start and end of SSC. When SSC\_EN is de-asserted, SSC is disabled only after completion of one full cycle of the triangular pattern given by the modulation frequency. This is done in order to maintain the average frequency.

Modulation frequency ( $f_m$ ) can be programmed as a ratio of  $F_{ref} / 4$ ; that is, the value that needs to be programmed  $ModFreqDivider = F_{ref} / (4 * f_m)$ . The  $ModFreqDivider$  is split into Mantissa and  $2^{Exponent}$  ( $ModFreqDivider = ModFreqDividerMantissa * 2^{ModFreqDividerExponent}$ ). The mantissa is controlled by 7-bit signal  $ModFreqDividerMantissa$  through  $CM\_SSC\_MODFREQDIV\_DPLL\_xxx.MODFREQDEV\_MANTISSA$  bit field. The exponent is controlled by 3bit signal  $ModFreqDividerExponent$  through the  $CM\_SSC\_MODFREQDIV\_DPLL\_xxx.MODFREQDEV\_EXPONENT$  bit field.

**Note:** Although the same value of  $ModFreqDivider$  can be obtained by different combinations of mantissa and exponent values, it is recommended to get the target  $ModFreqDivider$  by programming maximum mantissa and a minimum exponent. To define the Frequency spread ( $\Delta f$ ),  $\Delta M$  must be controlled as explained previously. To define  $\Delta M$ , the step size of  $M$  for each  $F_{ref}$  during the triangular pattern must be programmed; that is,

$$\Delta M = (2^{ModFreqDividerExponent}) * ModFreqDividerMantissa * DeltaMStep \text{ IF} \\ ModFreqDividerExponent \leq 3 \Delta M = 8 * ModFreqDividerMantissa * DeltaMStep \text{ IF} \\ ModFreqDividerExponent > 3$$

$DeltaMStep$  is split into integer part and fractional part. Integer part is controlled by 2-bit signal  $DeltaMStepInteger$  through the  $CM\_SSC\_DELTAMSTEP\_DPLL\_xxx.DELTAMSTEP\_INTEGER$  bit field. Fractional part is controlled by 18-bit signal  $DeltaMStepFraction$  through the  $CM\_SSC\_DELTAMSTEP\_DPLL\_xxx.DELTAMSTEP\_FRACTION$  bit field.

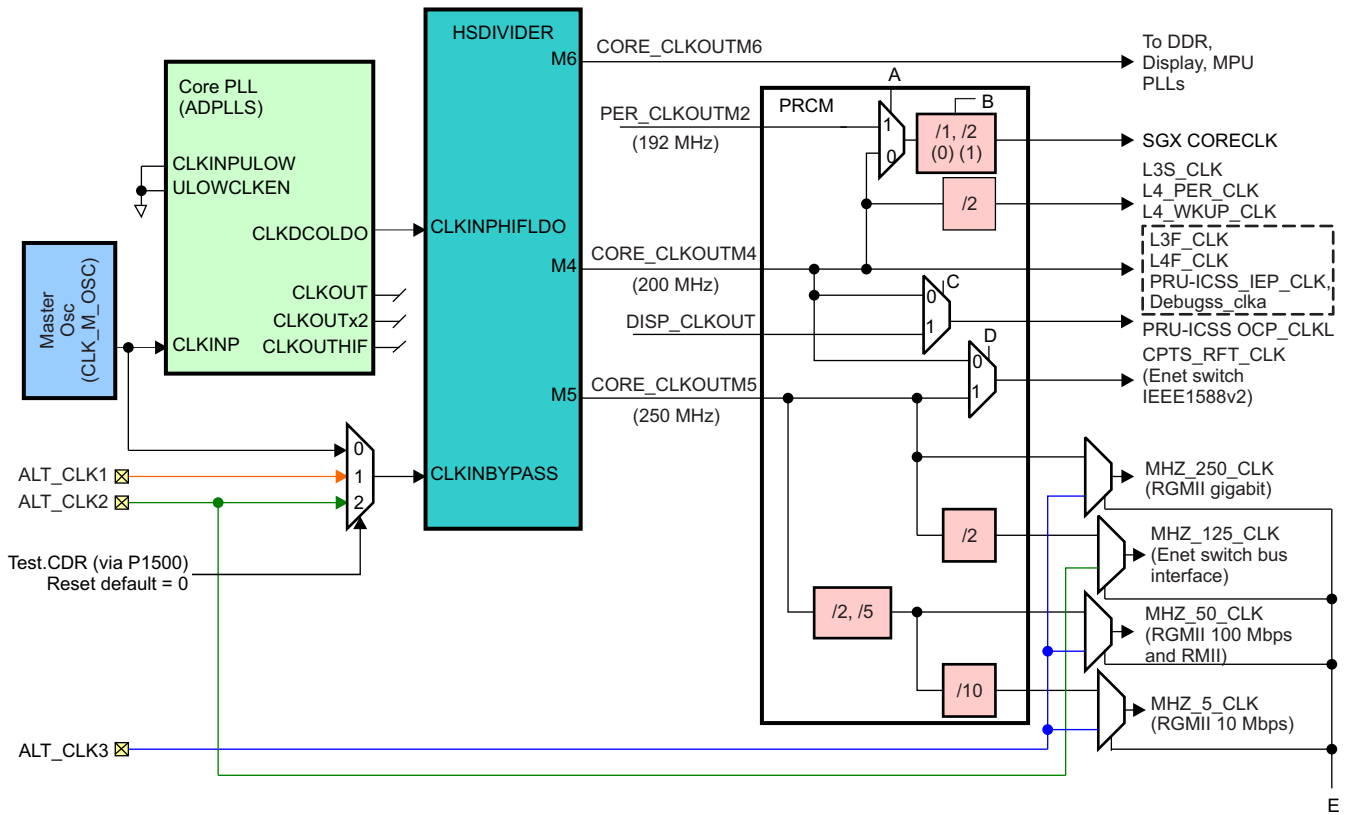

The frequency spread achieved has an overshoot of 20 percent or an inaccuracy of +20 percent. If the  $CM\_CLKMODE\_DPLL.DPLL\_SSC\_DOWNSPREAD$  is set to 1, the frequency spread on lower side is twice the programmed value. The frequency spread on higher side is 0 (except for the overshoot as described previously).

There is restriction of range of  $M$  values. The restriction is  $M - \Delta M$  should be  $\geq 20$ . Also,  $M + \Delta M$  should be  $\leq 2045$ . In case the downspread feature is enabled,  $M - 2 * \Delta M$  should be  $\geq 20$  and  $M \leq 2045$ .

### 8.1.6.7 Core PLL Description

The Core PLL provides the source for a majority of the device infrastructure and peripheral clocks. The Core PLL comprises an ADPLLS with HSDIVIDER and additional dividers and muxes located in the PRCM as shown in [Figure 8-10](#).

Figure 8-10. Core PLL

ALT\_CLKs are to be used for internal test purpose and should not be used in functional mode.

**Table 8-21. PLL and Clock Frequencies**

Mux Select	Register Bit <a href="#">Section 9.2.4.4</a>
A	PRCM.CLKSEL_GFX_FCLK[1]
B	PRCM.CLKSEL_GFX_FCLK[0]
C	PRCM.CLKSEL_PRU-ICSS_OCP_CLK[0]
D	PRCM.CM_CPTS_RFT_CLKSEL[0]
E	TEST.CDR (via P1500)

**Table 8-22** gives the typical PLL and clock frequencies. The HSDIVIDER is used to generate three divided clocks M4, M5 & M6. M4 & M5 are nominally 200 & 250 MHz, respectively.

**Table 8-22. Core PLL Typical Frequencies (MHz)**

CLOCK	Source	Power-On-Reset / HSDIVIDER Bypass		OPP100		OPP50 <sup>(1)</sup> <sup>(2)</sup>	
		DIV	Freq	DIV Value	Freq (MHz)	DIV Value	Freq (MHz)

<sup>(1)</sup> Not all interfaces and peripheral modules are available in OPP50. For more information, see the device specific datasheet.

<sup>(2)</sup> For limitations using OPP50, see *AM335x ARM Cortex-A8 Microprocessors (MPUs) Silicon Errata* (literature number [SPRZ360](#)).

The ADPLLS module supports two different bypass modes via their internal MNBypass mode and their external Low Power Idle bypass mode. The PLLs are in the MNBypass mode after power-on reset and can be configured by software to enter Low Power Idle bypass mode for power-down.

When the Core PLL is configured in bypass mode, the HSDIVIDER enters bypass mode and the CLKINBYPASS input is driven on the M4, M5, and M6 outputs. CLKINBYPASS defaults to the master oscillator input (typically 24 MHz).

**Table 8-23. Bus Interface Clocks**

#### 8.1.6.7.1 Core PLL Configuration

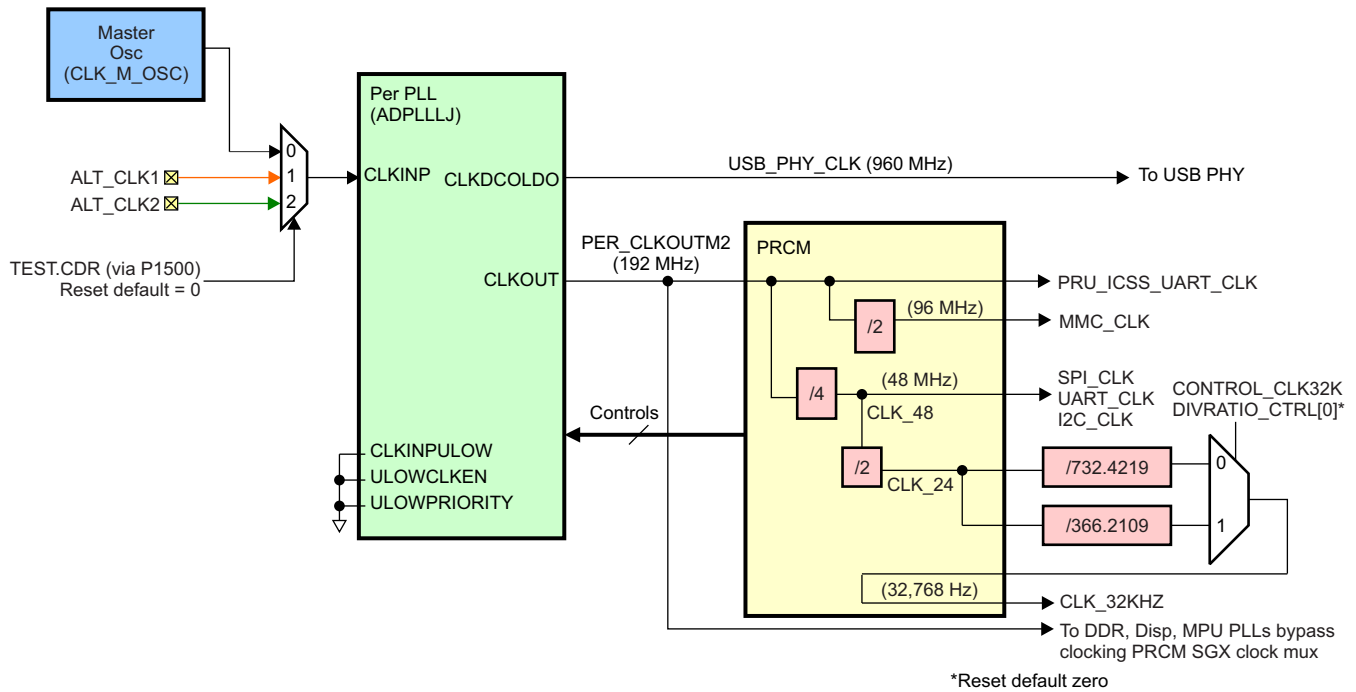

1. Switch PLL to bypass mode by setting CM\_CLKMODE\_DPLL\_CORE.DPLL\_EN to 0x4.
2. Wait for CM\_IDLEST\_DPLL\_CORE.ST\_MN\_BYPASS = 1 to ensure PLL is in bypass (CM\_IDLEST\_DPLL\_CORE.ST\_DPLL\_CLK should also change to 0 to denote the PLL is unlocked).
3. Configure Multiply and Divide values by setting CM\_CLKSEL\_DPLL\_CORE.DPLL\_MULT and DPLL\_DIV to the desired values.
4. Configure M4, M5 and M6 dividers by setting HSDIVIDER\_CLKOUT1\_DIV bits in CM\_DIV\_M4\_DPLL\_CORE, CM\_DIV\_M5\_DPLL\_CORE, and CM\_DIV\_M6\_DPLL\_CORE to the desired values.
5. Switch over to lock mode by setting CM\_CLKMODE\_DPLL\_CORE.DPLL\_EN to 0x7.
6. Wait for CM\_IDLEST\_DPLL\_CORE.ST\_DPLL\_CLK = 1 to ensure PLL is locked (CM\_IDLEST\_DPLL\_CORE.ST\_MN\_BYPASS should also change to 0 to denote the PLL is out of bypass mode).

**Note:** M4, M5, and M6 dividers can also be changed on-the-fly so that there is no need to put the PLL in bypass and back to lock mode. After changing CM\_DIV\_Mx\_DPLL\_CORE.DPLL\_CLKOUT\_DIV, check CM\_DIV\_Mx\_DPLL\_CORE.DPLL\_HSDIVIDER\_CLKOUT1\_DIVCHACK for a toggle (a change from 0 to 1 or 1 to 0) to see if the change was acknowledged by the PLL.

#### 8.1.6.8 Peripheral PLL Description

The Per PLL provides the source for peripheral functional clocks. The Per PLL comprises an ADPLLLJ and additional dividers and muxes located in the PRCM as shown

**Figure 8-11. Peripheral PLL Structure**

ALT\_CLKs are to be used for internal test purpose and should not be used in functional mode.

The PLL is locked at 960 MHz. The PLL output is divided by the M2 divider to generate a 192-MHz CLKOUT. This clock is gated in the PRCM to form the PRU-ICSS UART clock. There is a /2 divider to create 96 MHz for MMC\_CLK. The clock is also divided within the PRCM by a fixed /4 divider to create a 48-MHz clock for the SPI, UART and I2C modules. The 48-MHz clock is further divided by a fixed /2 divider and a fixed /732.4219 divider to create an accurate 32.768-KHz clock for Timer and debounce use.

**Table 8-24. Per PLL Typical Frequencies (MHz)**

Clock	Source	Power-On-Reset / PLL Bypass		OPP100		OPP50 <sup>(1) (2)</sup>	
		DIV Value	Freq	DIV Value	Freq (MHz)	DIV Value	Freq (MHz)
PLL Lock frequency	PLL	-	-	-	960	-	960
USB_PHY_CLK	CLKDCOLDO	-	Held Low	-	960	-	960
PER_CLKOUTM2	CLKOUT of ADPLLJ CLKOUT uses PLL's M2 Divider when PLL is locked and PLL's N2 divider when PLL Bypass	N2 is 0 on power-on-reset	Mstr Xtal/ (N2+1)	5	192	10	96
MMC_CLK	PER_CLKOUTM2	2	Mstr Xtal/ ((N2+1)*2)	2	96	2	48
SPI_CLK, UART_CLK, I2C_CLK	PER_CLKOUTM2	4	Mstr Xtal/ ((N2+1)*4)	4	48	4	24
CLK_24	CLK_48	2	CLK_48 /2	2	24	2	12
CLK_32KHZ	CLK_24 (output of CLK_48/2)	732.4219	CLK_24 / <CLK32_DIV>	732.4219	0.032768	366.2109	0.032768

<sup>(1)</sup> For limitations using OPP50, see *AM335x ARM Cortex-A8 Microprocessors (MPUs) Silicon Errata* (literature number [SPRZ360](#)).

<sup>(2)</sup> Not all interfaces and peripheral modules are available in OPP50. For more information, see *AM335x ARM Cortex-A8 Microprocessors (MPUs) Silicon Errata* (literature number [SPRZ360](#)).

The ADPLLJ module supports two different bypass modes via their internal MNBypass mode and their external Low Power Idle bypass mode. The PLLs are in the MNBypass mode after power-on reset and can be configured by software to enter Low Power Idle bypass mode for power-down.

The PER PLL can use the Low Power Idle bypass mode. When the internal bypass mode is selected, the CLKOUT output is driven by  $CLKINP/(N2+1)$  where N2 is driven by the PRCM. CLKINP defaults to the master oscillator input (typically 24 MHz)

#### 8.1.6.8.1 Configuring the Peripheral PLL

The following steps detail how to configure the peripheral PLL.

1. Switch PLL to bypass mode by setting CM\_CLKMODE\_DPLL\_PER.DPLL\_EN to 0x4.
2. Wait for CM\_IDLEST\_DPLL\_PER.ST\_MN\_BYPASS = 1 to ensure PLL is in bypass (CM\_IDLEST\_DPLL\_PER.ST\_DPLL\_CLK should also change to 0 to denote the PLL is unlocked).
3. Configure Multiply and Divide values by setting CM\_CLKSEL\_DPLL\_PER.DPLL\_MULT and DPLL\_DIV to the desired values.
4. Configure M2 divider by setting CM\_DIV\_M2\_DPLL\_PER.DPLL\_CLKOUT\_DIV to the desired value.
5. Switch over to lock mode by setting CM\_CLKMODE\_DPLL\_PER.DPLL\_EN to 0x7.
6. Wait for CM\_IDLEST\_DPLL\_PER.ST\_DPLL\_CLK = 1 to ensure PLL is locked (CM\_IDLEST\_DPLL\_PER.ST\_MN\_BYPASS should also change to 0 to denote the PLL is out of bypass mode).

**Note:** M2 divider can also be changed on-the-fly (ie., there is no need to put the PLL in bypass and back to lock mode). After changing CM\_DIV\_M2\_DPLL\_PER.DPLL\_CLKOUT\_DIV, check CM\_DIV\_M2\_DPLL\_PER.DPLL\_CLKOUT\_DIVCHACK for a toggle (a change from 0 to 1 or 1 to 0) to see if the change was acknowledged by the PLL.

#### 8.1.6.9 MPU PLL Description

The Cortex A8 MPU subsystem includes an internal ADPLLs for generating the required Cortex A8 MPU clocks. This PLL is driven by the master oscillator output with control provided by PRCM registers.

**Figure 8-12. MPU Subsystem PLL Structure**

For example:

For a frequency for MPU, say 600 MHz, the ADPLLs is configured (PLL locked at 1200 MHz and M2 Divider =1) so as to expect CLKOUT = 600 MHz .

The ULOWCLKEN input from a programmable PRCM register selects whether CLKINP or CLKINPULOW is the bypass clock source. This is a glitch free switch. When CLKINP is selected it is sourced through the ADPLLs  $1/(N2+1)$  divider. The PRCM register defaults to 0 on power-up to select the CLKINP source.

The CLKINPULOW input may be sourced from the CORE\_CLKOUTM6 from the Core PLL, or PER\_CLKOUTM2 from the Per PLL. These PLL output clocks can be used as alternate clock sources in low power active use cases for the MPU Subsystem clock when the PLL is in bypass mode.

### 8.1.6.9.1 Configuring the MPU PLL

The following steps detail how to configure the MPU PLL.

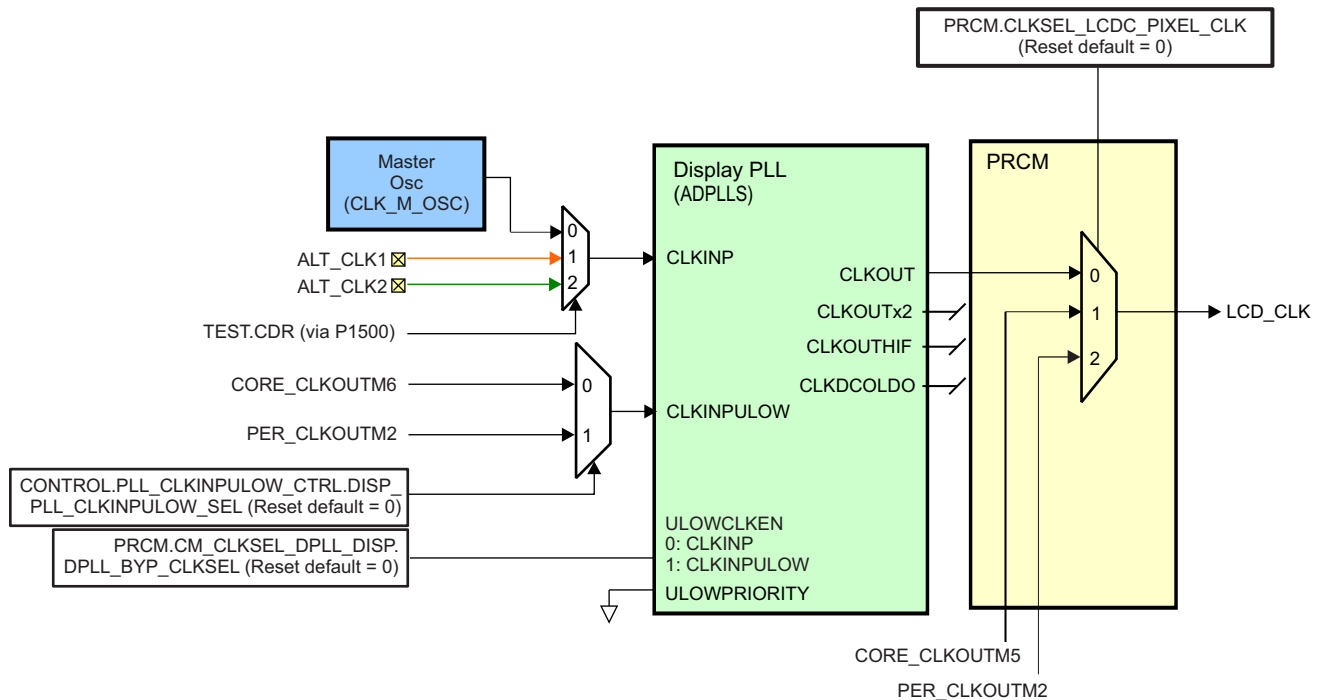

1. Switch PLL to bypass mode by setting CM\_CLKMODE\_DPLL\_MPU.DPLL\_EN to 0x4.
2. Wait for CM\_IDLEST\_DPLL\_MPU.ST\_MN\_BYPASS = 1 to ensure PLL is in bypass (CM\_IDLEST\_DPLL\_MPU.ST\_DPLL\_CLK should also change to 0 to denote the PLL is unlocked).
3. Configure Multiply and Divide values by setting CM\_CLKSEL\_DPLL\_MPU.DPLL\_MULT and DPLL\_DIV to the desired values.
4. Configure M2 divider by setting CM\_DIV\_M2\_DPLL\_MPU.DPLL\_CLKOUT\_DIV to the desired value.
5. Switch over to lock mode by setting CM\_CLKMODE\_DPLL\_MPU.DPLL\_EN to 0x7.
6. Wait for CM\_IDLEST\_DPLL\_MPU.ST\_DPLL\_CLK = 1 to ensure PLL is locked (CM\_IDLEST\_DPLL\_MPU.ST\_MN\_BYPASS should also change to 0 to denote the PLL is out of bypass mode).

**Note:** M2 divider can also be changed on-the-fly (ie., there is no need to put the PLL in bypass and back to lock mode). After changing CM\_DIV\_M2\_DPLL\_MPU.DPLL\_CLKOUT\_DIV, check CM\_DIV\_M2\_DPLL\_MPU.DPLL\_CLKOUT\_DIVCHACK for a toggle (a change from 0 to 1 or 1 to 0) to see if the change was acknowledged by the PLL.

### 8.1.6.10 Display PLL Description

The Display PLL provides the pixel clock required for the LCD display and is independent from the other peripheral and infrastructure clocks. The PLL is clocked from the Master Oscillator. The ADPLLS M2 divider determines the output clock frequency which is clock gated by the PRCM as shown in Figure 8-13.

Figure 8-13. Display PLL Structure

For example: say frequency for pixel clock 100 MHz, the ADPLLS is configured (PLL locked at 200 MHz and M2 Divider = 1) so as to expect CLKOUT = 100 MHz.

The ULOWCLKEN input from a programmable PRCM register selects whether CLKINP or CLKINPULOW is the bypass clock source. This is a glitch free switch. When CLKINP is selected it is sourced through the ADPLLS 1/(N2+1) divider. The PRCM register defaults to 0 on power-up to select the CLKINP source.

The CLKINPULOW input is sourced from the CORE\_CLKOUTM6 from the Core PLL or PER\_CLKOUTM2 from the Per PLL. This PLL output clock can be used as an alternate clock source in low power active use cases for the pixel clock when the Display PLL is in bypass mode.

#### 8.1.6.10.1 Configuring the Display PLL

The following steps detail how to configure the display PLL.

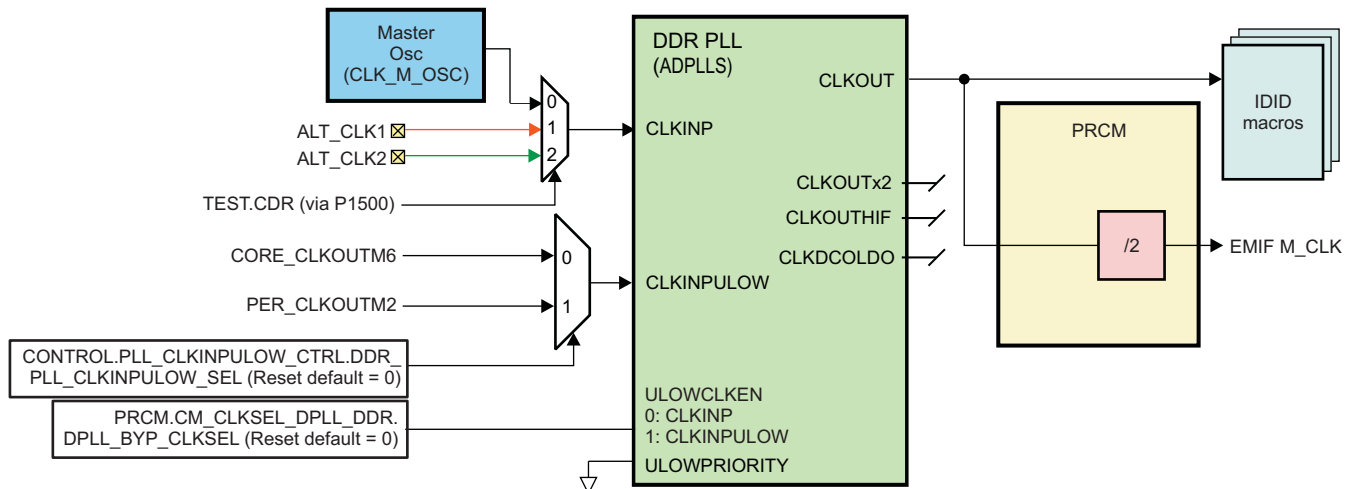

1. Switch PLL to bypass mode by setting CM\_CLKMODE\_DPLL\_DISP.DPLL\_EN to 0x4.
2. Wait for CM\_IDLEST\_DPLL\_DISP.ST\_MN\_BYPASS = 1 to ensure PLL is in bypass (CM\_IDLEST\_DPLL\_DISP.ST\_DPLL\_CLK should also change to 0 to denote the PLL is unlocked).
3. Configure Multiply and Divide values by setting CM\_CLKSEL\_DPLL\_DISP.DPLL\_MULT and DPLL\_DIV to the desired values.
4. Configure M2 divider by setting CM\_DIV\_M2\_DPLL\_DISP.DPLL\_CLKOUT\_DIV to the desired value.
5. Switch over to lock mode by setting CM\_CLKMODE\_DPLL\_DISP.DPLL\_EN to 0x7.
6. Wait for CM\_IDLEST\_DPLL\_DISP.ST\_DPLL\_CLK = 1 to ensure PLL is locked (CM\_IDLEST\_DPLL\_DISP.ST\_MN\_BYPASS should also change to 0 to denote the PLL is out of bypass mode).

**Note:** M2 divider can also be changed on-the-fly (ie., there is no need to put the PLL in bypass and back to lock mode). After changing `CM_DIV_M2_DPLL_DISP.DPLL_CLKOUT_DIV`, check `CM_DIV_M2_DPLL_DISP.DPLL_CLKOUT_DIVCHACK` for a toggle (a change from 0 to 1 or 1 to 0) to see if the change was acknowledged by the PLL.

### 8.1.6.11 DDR PLL Description

The DDR PLL provides the clocks required by the DDR macros and the EMIF and is independent from the other peripheral and infrastructure clocks. The PLL is clocked from the Master Oscillator. The ADPLLs M2 divider determines the output clock frequency which is connected directly to the DDR Macros. The clock is also routed through the PRCM where a fixed /2 divider is used to create the M\_CLK used by the EMIF as shown in Figure 8-14.

Figure 8-14. DDR PLL Structure

For OPP information, see the device-specific data manual.

Example frequency for DDR clock, say 266 MHz, the ADPLLs is configured (PLL locked at 532 MHz and M2 Divider =1) so as to expect  $CLKOUT = 266$  MHz.

The ULOWCLKEN input from a programmable PRCM register selects whether CLKINP or CLKINPULOW is the bypass clock source. This is a glitch free switch. When CLKINP is selected it is sourced through the ADPLLs  $1/(N2+1)$  divider. The PRCM register defaults to 0 on power-up to select the CLKINP source.

The CLKINPULOW input may be sourced from the CORE\_CLKOUTM6 from the Core PLL, or PER\_CLKOUTM2 from the Per PLL. These PLL output clocks can be used as alternate clock sources in low power active use cases for the DDR clocks when PLL is in bypass mode

#### 8.1.6.11.1 Configuring the DDR PLL

The following steps detail how to configure the DDR PLL.

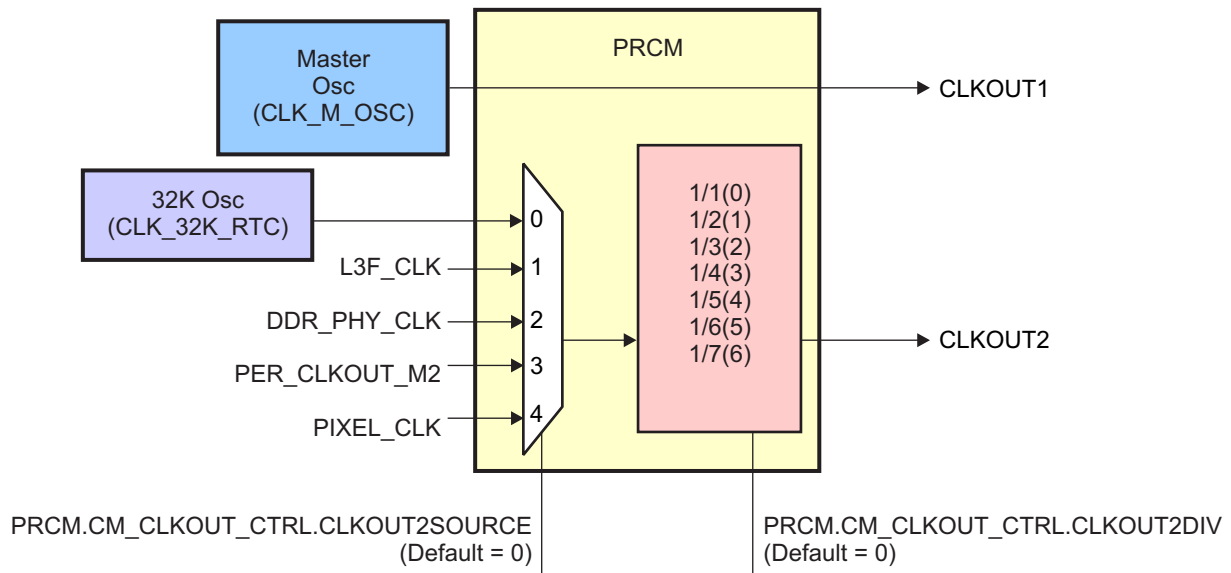

1. Switch PLL to bypass mode by setting `CM_CLKMODE_DPLL_DDR.DPLL_EN` to 0x4.
2. Wait for `CM_IDLEST_DPLL_DDR.ST_MN_BYPASS = 1` to ensure PLL is in bypass (`CM_IDLEST_DPLL_DDR.ST_DPLL_CLK` should also change to 0 to denote the PLL is unlocked).
3. Configure Multiply and Divide values by setting `CM_CLKSEL_DPLL_DDR.DPLL_MULT` and `DPLL_DIV` to the desired values.
4. Configure M2 divider by setting `CM_DIV_M2_DPLL_DDR.DPLL_CLKOUT_DIV` to the desired value.
5. Switch over to lock mode by setting `CM_CLKMODE_DPLL_DDR.DPLL_EN` to 0x7.
6. Wait for `CM_IDLEST_DPLL_DDR.ST_DPLL_CLK = 1` to ensure PLL is locked (`CM_IDLEST_DPLL_DDR.ST_MN_BYPASS` should also change to 0 to denote the PLL is out of bypass mode).

**Note:** M2 divider can also be changed on-the-fly (i.e., there is no need to put the PLL in bypass and back to lock mode). After changing CM\_DIV\_M2\_DPLL\_DDR.DPLL\_CLKOUT\_DIV, check CM\_DIV\_M2\_DPLL\_DDR.DPLL\_CLKOUT\_DIVCHACK for a toggle (a change from 0 to 1 or 1 to 0) to see if the change was acknowledged by the PLL.

### 8.1.6.12 CLKOUT Signals

The CLKOUT1 and CLKOUT2 signals go device pads and should mainly be used as debug testpoints. Using these signals for time-critical external circuits is discouraged because of unpredictable jitter performance. For more information, see the device datasheet, *AM335x ARM Cortex-A8 Microprocessors (MPUs)* (literature number [SPRS717](#)). CLKOUT1 is created from the master oscillator. CLKOUT2 can be sourced from the 32-KHz crystal oscillator or any of the PLL (except MPU PLL) outputs. The selected output can be further modified by a programmable divider to create the desired output frequency.

Figure 8-15. CLKOUT Signals

### 8.1.6.13 Timer Clock Structure

The CLK\_32KHZ clock is an accurate 32.768-MHz clock derived from the PER PLL and can also be selected for the WDT1. The DMTIMER0 can only be clocked from the internal RC oscillator (CLK\_RC32K). The clock options are shown in [Figure 8-16](#).

Figure 8-16. Watchdog Timer Clock Selection

All mux selections are in PRCM unless explicitly shown otherwise in the diagrams.

The clock selections for the other device Timer modules are shown in [Figure 8-17](#). CLK\_32KHZ, the master oscillator, and the external pin (TCLKIN) are optional clocks available for timers which may be selected based on end use application.

DMTIMER1 is implemented using the DMTimer\_1ms module which is capable of generating an accurate 1ms tick using a 32.768 KHz clock. During low power modes, the Master Oscillator is disabled. CLK\_32KHZ also would not be available in this scenario since it is sourced from the Master Osc based PER PLL. Hence, in low power modes DMTIMER1 in the WKUP domain can use the 32K RC oscillator for generating the OS (operating system) 1ms tick generation and timer based wakeup. Since most applications expect an accurate 1ms OS tick which the inaccurate 32K RC (16-60 KHz) oscillator cannot provide, a separate 32768 Hz oscillator (32K Osc) is provided as another option.

**Figure 8-17. Timer Clock Selection**

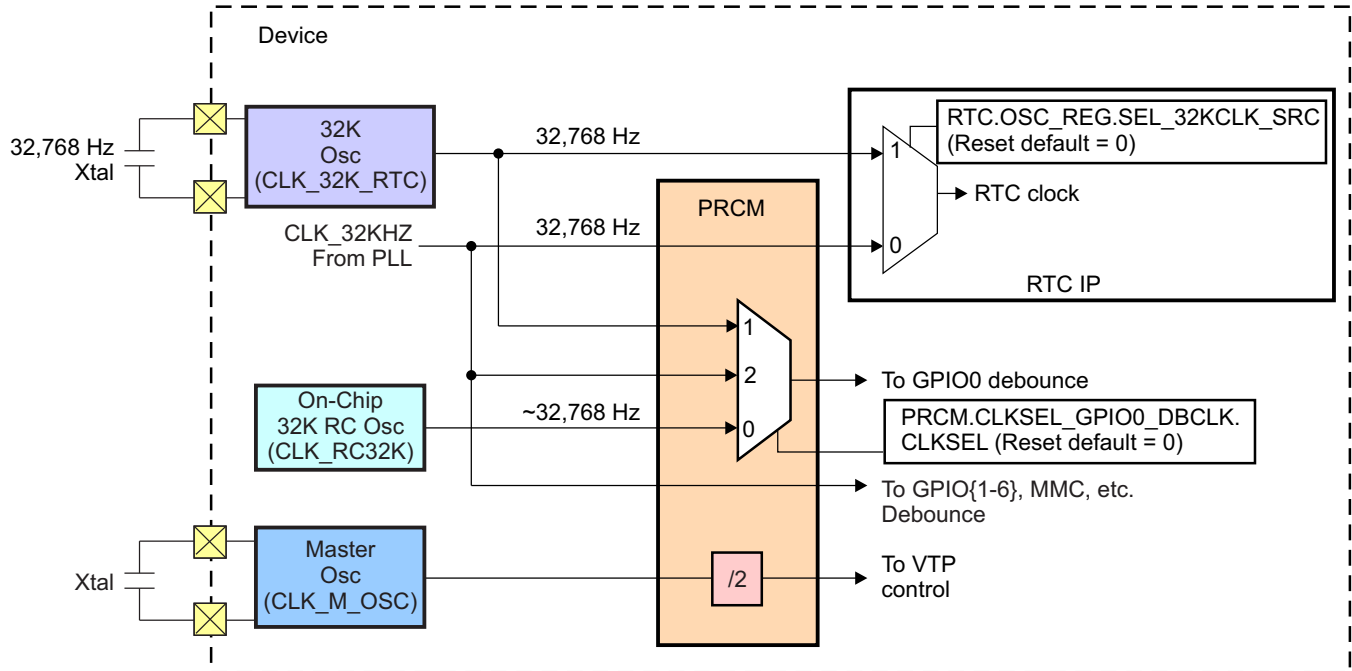

All mux selections are in PRCM unless explicitly shown otherwise in the diagrams.

The RTC, Debounce and VTP clock options are shown in [Figure 8-18](#). In low power modes, the debounce for GPIO0 in WKUP domain can use the accurate 32768 Hz crystal oscillator or the inaccurate (16 KHz to 60 KHz) 32K RC oscillator when the Master Osc is powered down.

The 32K Osc requires an external 32768-Hz crystal.

All mux selections are in PRCM unless explicitly shown otherwise in the diagrams.

Figure 8-18. RTC, VTP, and Debounce Clock Selection

All mux selections are in PRCM unless explicitly shown otherwise in the diagrams.

## 8.1.7 Reset Management

### 8.1.7.1 Overview

The PRCM manages the resets to all power domains inside device and generation of a single reset output signal through device pin, PWRONRSTn, for external use. The PRCM has no knowledge of or control over resets generated locally within a module, e.g., via the OCP configuration register bit IPName\_SYSCONFIG.SoftReset.

All PRM reset outputs are asynchronously asserted. These outputs are active-low except for the PLL resets. Deassertion is synchronous to the clock which runs a counter used to stall, or delay, reset deassertion upon source deactivation. This clock will be CLK\_M\_OSC used by all the reset managers. All modules receiving a PRCM generated reset are expected to treat the reset as asynchronous and implement local re-synchronization upon de-activation as needed.

One or more Reset Managers are required per power domain. Independent management of multiple reset domains is required to meet the reset sequencing requirements of all modules in the power domain

### 8.1.7.2 Reset Concepts and Definitions

The PRCM collects many sources of reset. Here below is a list of qualifiers of the source of reset:

- Cold reset: it affects all the logic in a given entity
- Warm reset: it is a partial reset which doesn't affect all the logic in a given entity
- Global reset: it affects the entire device
- Local reset: it affects part of the device (1 power domain for example)
- S/W reset: it is initiated by software
- H/W reset: it is hardware driven

Each reset source is specified as being a cold or warm type. Cold types are synonymous with power-on-reset (POR) types. Such sources are applied globally within each receiving entity (i.e., sub-system, module, macro-cell) upon assertion. Cold reset events include: device power-up, power-domain power-up, and eFuse programming failures.

Warm reset types are not necessarily applied globally within each receiving entity. A module may use a warm reset to reset a subset of its logic. This is often done to speed-up reset recovery time, i.e., the time to transition to a safe operating state, compared to the time required upon receipt of a cold reset. Warm reset events include: software initiated per power-domain, watch-dog time-out, externally triggered, and emulation initiated.

Reset sources, warm or cold types, intended for device-wide effect are classified as global sources. Reset sources intended for regional effect are classified as local sources.

Each Reset Manager provides two reset outputs. One is a cold reset generated from the group of global and local cold reset sources it receives. The other is a warm+cold reset generated from the combined groups of, global and local, cold and warm reset sources it receives.

The Reset Manager asserts one, or both, of its reset outputs asynchronously upon reset source assertion. Reset deassertion is extended beyond the time the source gets de-asserted. The reset manager will then extend the active period of the reset outputs beyond the release of the reset source, according to the PRCM's internal constraints and device's constraints. Some reset durations can be software-configured. Most (but not all) reset sources are logged by PRCM's reset status registers. The same reset output can generally be activated by several reset sources and the same reset source can generally activate several reset outputs. All the reset signals output of the PRCM are active low. Several conventions are used in this document for signal and port names. They include:

- "\_RST" in a signal or port name is used to denote reset signal.
- "\_PWRON\_RST" in a signal or port name is used to denote a cold reset source

### 8.1.7.3 Global Power On Reset (Cold Reset)

There are several cold reset sources. See [Table 8-25](#) for a summary of the different reset sources.

#### 8.1.7.3.1 Power On Reset (PORz)

The source of power on reset is PORz signal on the device. Everything on device is reset with assertion of power on reset. This reset is non-blockable. PORz can be driven by external power management devices or power supervisor circuitry. During power-up, when power supplies to the device are ramping up, PORz needs to be driven Low. When the ramp-up is complete and supplies reach their steady-state values, PORz need to be driven High. During normal operation when any of the device power supplies are turned OFF, PORz must be driven Low.

#### 8.1.7.3.2 PORz Sequence

- PORz pin at chip boundary gets asserted (goes low). **Note:** The state of nRESETIN\_OUT during PORz assertion should be a don't care, it should not affect PORz (only implication is if they are both asserted and nRESETIN\_OUT is deasserted after PORz you will get re-latching of boot config pins and may see warm nRESETIN\_OUT flag set in PRCM versus POR).
- All IOs will go to a known state, as defined in the device datasheet, *AM335x ARM Cortex-A8 Microprocessors (MPUs)* (literature number [SPRS717](#))
- When power comes-up, PORz value will propagate to the PRCM.
- PRCM will fan out reset to the complete chip and all logic which uses async reset will get reset. nRESETIN\_OUT will go low to indicate reset-in-progress.
- External clocks will start toggling and PRCM will propagate these clocks to the chip keeping PLLs in bypass mode.
- All logic using sync reset will get reset.
- When power and clocks to the chip are stable, PORz must be de-asserted.
- Boot configuration pins are latched upon de-assertion of PORz pin
- IO cell controls from IPs for all the IOs with a few exceptions (see datasheet for details) are driven by

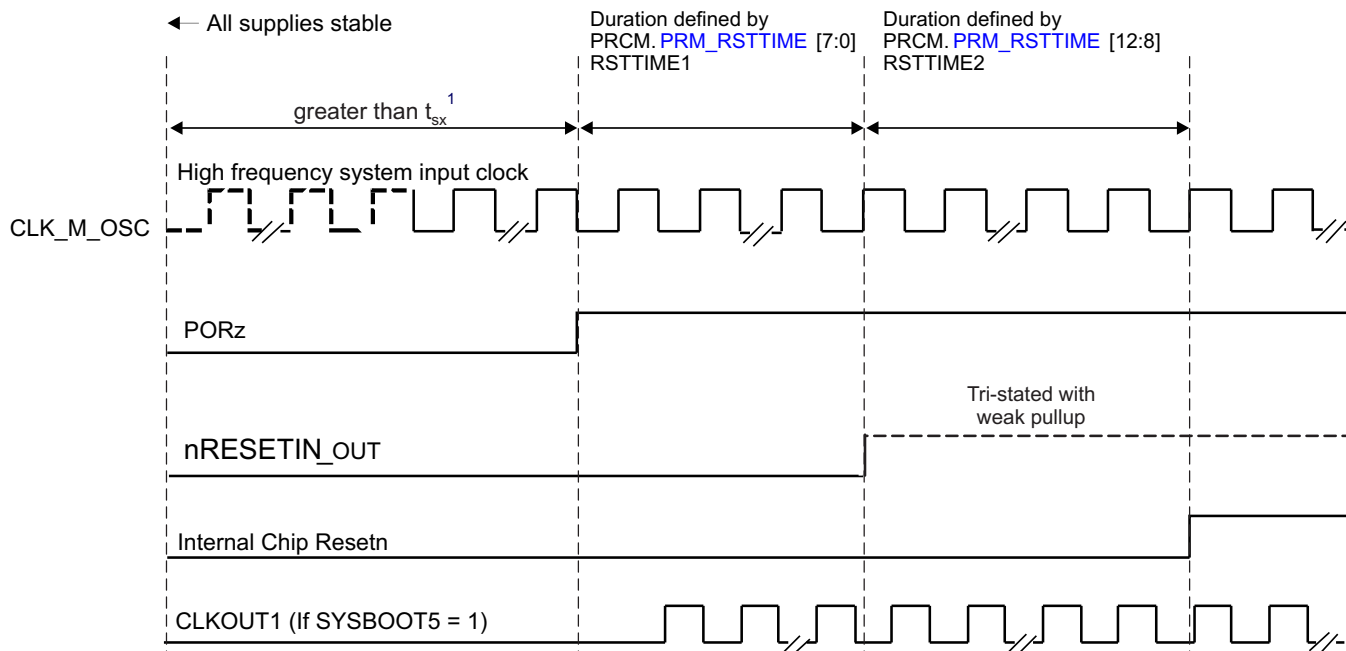

GPIO module. GPIO puts all IOs in input mode.

- FuseFarm reset will be de-asserted to start eFuse scanning.
- Once eFuse scanning is complete, reset to the host processor and to all other peripherals (peripherals without local processor) will be de-asserted.
- nRESETIN\_OUT will be de-asserted after time defined by PRM\_RSTTIME.RSTTIME1.
- Once host processors finish booting then all remaining peripherals will see reset de-assertion.

Note that all modules with local CPUs will have local reset asserted by default at PORz and reset de-assertion would require host processor to write to respective registers in PRCM.

Figure 8-19. PORz

(1) For information on  $t_{sx}$ , see AM335x ARM Cortex-A8 Microprocessors (MPUs) (literature number [SPRS717](#)).

### 8.1.7.3.3 Bad Device Reset

This reset is asserted whenever the DEVICE\_TYPE encodes an unsupported device type, such as the code for a "bad" device.

### 8.1.7.3.4 Global Cold Software Reset (GLOBAL\_COLD\_SW\_RST)

The source for GLOBAL\_COLD\_SW\_RST is generated internally by the PRM. It is activated upon setting the PRM\_RSTCTRL.RST\_GLOBAL\_COLD\_SW bit in the PRM memory map. This bit is self-clearing, i.e., it is automatically cleared by the hardware.

## 8.1.7.4 Global Warm Reset

### 8.1.7.4.1 External Warm Reset

nRESETIN\_OUT is a bidirectional warm reset signal. As an input, it is typically used by an external source as a device reset. Refer to Table 8-24 for a summary of the differences between a warm reset and cold reset. Some of these differences are:

- The warm reset can be blocked to the EMAC switch and its reference clock source PLL using the RESET\_ISO register in the Control Module.
- The warm reset assumes that clocks and power to the chip are stable from assertion through deassertion, whereas during the cold reset, the power supplies can become stable during assertion

- Some PRCM and Control module registers are warm reset insensitive and maintain their value throughout a warm reset
- SYSBOOT pins are not latched with a warm reset. The device will boot with the SYSBOOT values from the previous cold reset.
- Most debug subsystem logic is not affected by warm reset. This allows you to maintain any debug sessions throughout a warm reset event.
- PLLs are not affected by warm reset

As an output, nRESETIN\_OUT can be used to reset external devices. nRESET\_OUT will drive low during a cold reset or an internally generated warm reset. After completion of a cold or warm reset, nRESETIN\_OUT will continue to drive low for a period defined by PRM\_RSTTIME.RSTTIME1. RSTTIME1 is a timer that counts down to zero at a rate equal to the high frequency system input clock CLK\_M\_OSC. This allows external devices to be held in reset for some time after the AM335x comes out of reset.

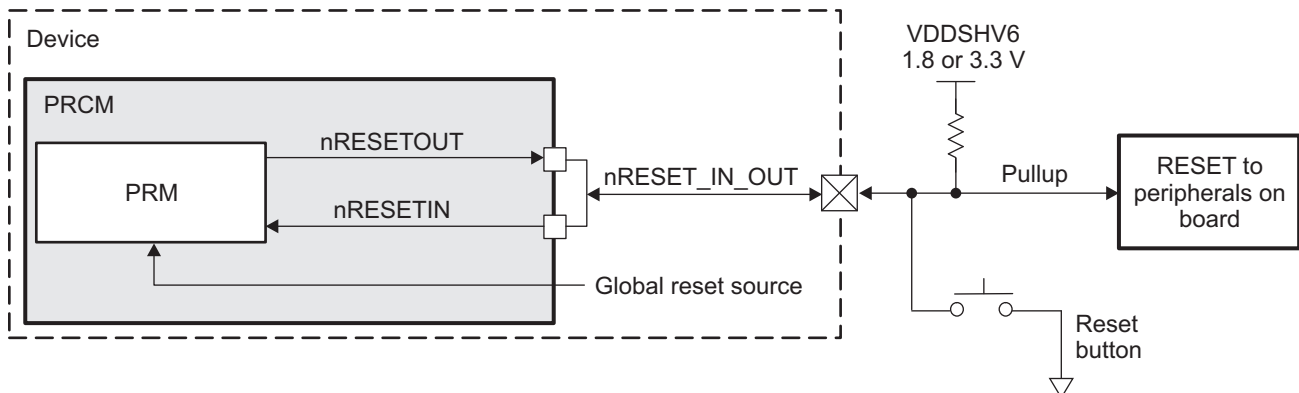

Caution must be used when implementing the nRESETIN\_OUT as an bi-directional reset signal. Because of the short maximum time allowed using RSTTIME1, it does not supply an adequate debounce time for an external push button circuit. The processor could potentially start running while external components are still in reset. It is recommended that this signal be used as input only (do not connect to other devices as a reset) to implement a push button reset circuit to the AM335x, or an output only to be able to reset other devices after an AM335x reset completes.

#### 8.1.7.4.1.1 Warm Reset Input/Reset Output (nRESETIN\_OUT)

Any global reset source (internal or external) causes nRESETIN\_OUT to be driven and maintained at the boundary of the device for at least the amount of time configured in the PRCM.PRM\_RSTTIME.RSTTIME1 bit field. This ensures that the device and its related peripherals are reset together. The nRESETIN\_OUT output buffer is configured as an open-drain; consequently, an external pull-up resistor is required.

After the de-assertion, the bi-directional pin nRESETIN\_OUT is tri-stated to allow for assertion from off chip source (externally).

**Figure 8-20. External System Reset**

Note: It is recommended to implement warm reset as an input only (for example, push button) or an output only (to reset external peripherals), not both.

The device will have one pin nRESETIN\_OUT which reflects chip reset status. This output will always assert asynchronously when any chip watchdog timer reset occurs if any of the following reset events occurs:

- POR (only internal stretched portion of reset event after bootstrap is latched)
- External Warm reset (nRESETIN\_OUT pin, only internal stretched portion of reset event after bootstrap is latched)
- Emulation reset (Cold or warm from ICEPICK)
- Reset requestor
- SW cold/warm reset

This output will remain asserted as long as PRCM keeps reset to the host processor asserted.

**Note:** TRST does not cause RSTOUTn assertion

**8.1.7.4.1.2 Warm Reset Sequence**

1. nRESETIN\_OUT pin at chip boundary gets asserted (goes low). NOTE: For Warm Reset sequence to work as described, it is expected that PORz pin is always inactive, otherwise you will get PORz functionality as described in previous section.
2. All IOs (except test and emulation) will go to tri-state immediately.
3. Chip clocks are not affected as both PLL and dividers are intact.
4. nRESETIN\_OUT gets de-asserted after 30 cycles
5. PRCM de-asserts reset to the host processor and all other peripherals without local CPUs.
6. Note that all IPs with local CPUs will have local reset asserted by default at Warm Reset and reset de-assertion would require host processor to write to respective registers in PRCM.

Figure 8-21 shows the nRESETIN\_OUT waveform when using nRESETIN\_OUT as warm reset source. For the duration when external warm reset switch is closed, both the device and chip will be driving zero.

**Figure 8-21. Warm Reset Sequence (External Warm Reset Source)**

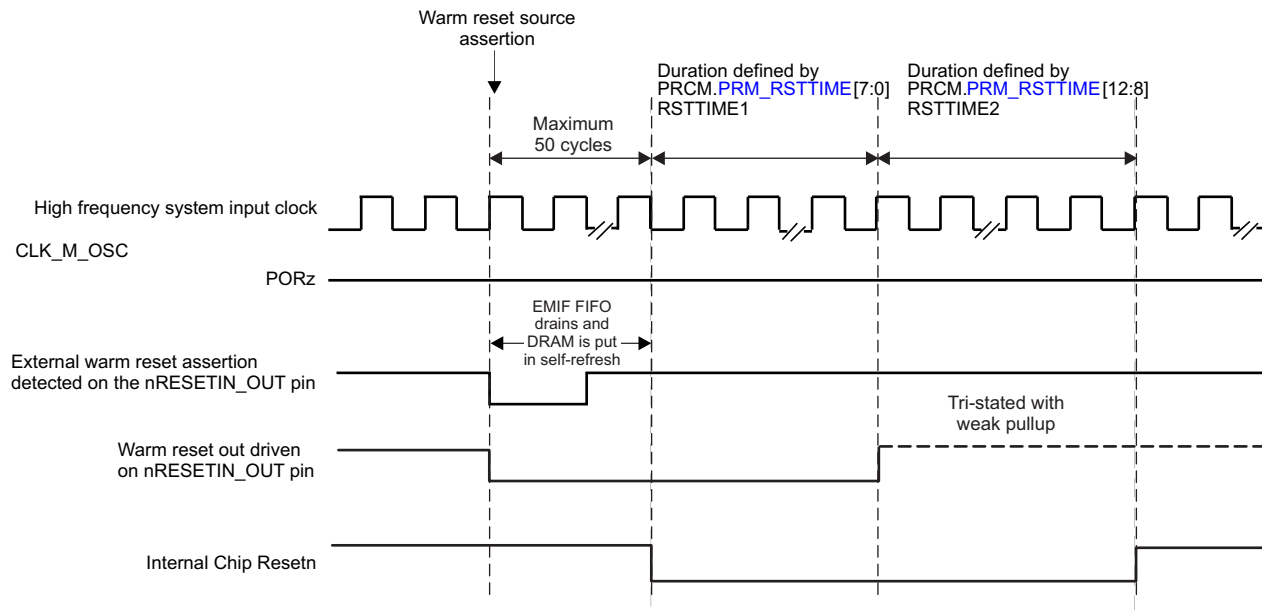

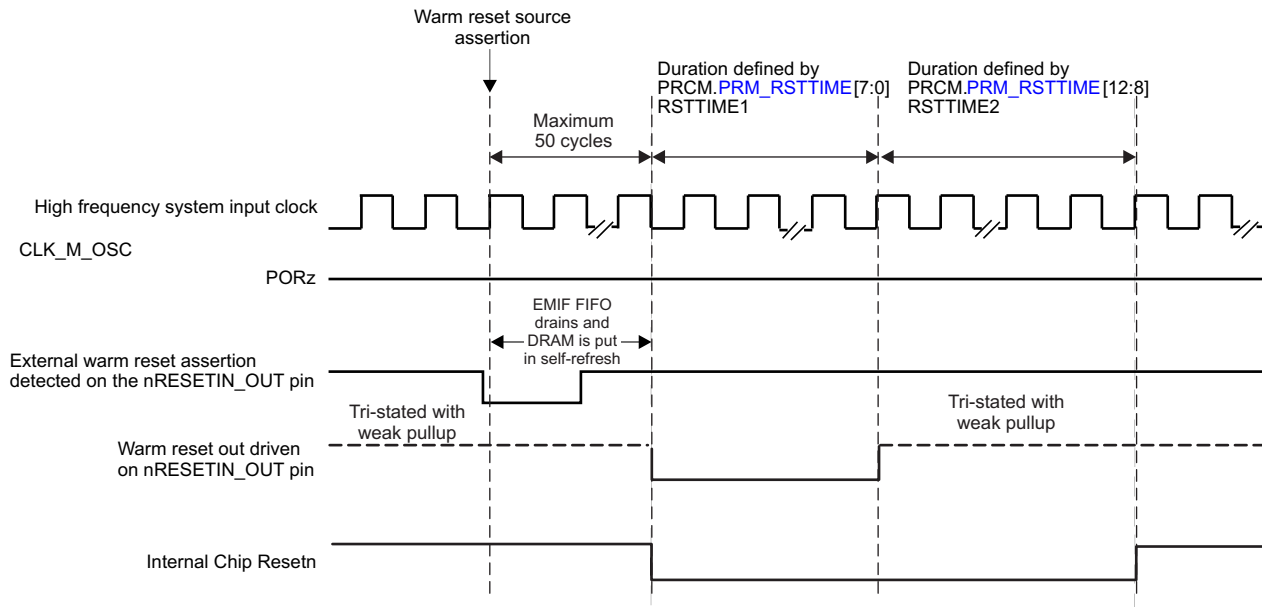

Figure 8-22 shows the nRESETIN\_OUT waveform when any one of the warm reset sources captured except using nRESETIN\_OUT itself as warm reset source.

**Figure 8-22. Warm Reset Sequence (Internal Warm Reset Source)**

#### 8.1.7.4.2 Watchdog Timer

There is one watchdog timer on the device. The reset is not blockable.

#### 8.1.7.4.3 Global Warm Software Reset (GLOBAL\_SW\_WARM\_RST)

#### 8.1.7.4.4 Test Reset (TRSTz)

This reset is triggered from TRSTz pin on JTAG interface. This is a non-blockable reset and it resets test and emulation logic.

**NOTE:** A PORz reset assertion should cause entire device to reset including all test and emulation logic regardless of the state of TRSTz. Therefore, PORz assertion will achieve full reset of the device even if TRSTz pin is pulled permanently high and no special toggling of TRSTz pin is required during power ramp to achieve full POR reset to the device. Further, it is acceptable for TRSTz input to be pulled permanently low during normal functional usage of the device in the end-system to ensure that all test and emulation logic is kept in reset.

**8.1.7.5 Reset Characteristics**

The following table shows characteristic of each reset source.

**Table 8-25. Reset Sources**

Characteristic	Cold Reset Sources			Warm Reset sources			
	Pin PORz	SW Cold Reset	Bad Device	Pin Warm Reset	Watchdog Timer	SW Warm Reset	TRSTz
Boot pins latched	Y	N	N	N	N	N	N
Resets Standard Efuses	Y	N	N	N	N	N	N
Resets Customer Efuses	Y	Y	Y	Y	Y	Y	N
DRAM contents preserved	N	N	N	Y <sup>(1)</sup>	Y <sup>(1)</sup>	Y <sup>(1)</sup>	Y
Resets PLLs <sup>(2)</sup>	Y	Y	Y	N	N	N	N
Resets Clock Dividers <sup>(2)</sup>	Y	Y	Y	N	N	N	N
PLLs enter bypass mode <sup>(2)</sup>	Y	Y	Y	Y	Y	Y	N
Reset source blockable by emulation	N	N	N	Y	Y	Y	Y
Resets test and emulation logic	Y	Y	Y	N	N	N	N
Resets GMAC switch and related chip logic	Y	N <sup>(3)</sup>	Y	N <sup>(3)</sup>	N <sup>(3)</sup>	N <sup>(3)</sup>	
Resets Chip Functional Logic <sup>(4)</sup>	Y	Y	Y	Y	Y	Y	N
Puts IOs in Tri-state	Y	Y	Y	Y	Y	Y	N
Resets Pinmux Registers	Y	Y	Y <sup>(5)</sup>	Y <sup>(5)</sup>	Y <sup>(5)</sup>	Y <sup>(5)</sup>	N
Reset out Assertion (nRESETIN_OUT Pin)	Y	Y	Y <sup>(5)</sup>	Y <sup>(5)</sup>	Y <sup>(5)</sup>	Y <sup>(5)</sup>	N
Resets RTC	N	N	N	N	N	N	N

<sup>(1)</sup> The ROM software does not utilize this feature of DRAM content preservation. Hence, the AM335x re-boots like a cold boot for warm reset as well.

<sup>(2)</sup> CORE PLL is an exception when EMAC switch reset isolation is enabled

<sup>(3)</sup> Only true if GMAC switch reset isolation is enabled in control registers, otherwise will be reset.

<sup>(4)</sup> There are exception details in control module & PRCM registers which are captured in the register specifications in [Chapter 8](#) and [Chapter 9](#). This includes some pinmux registers which are warm reset in-sensitive.

<sup>(5)</sup> Some special IOs/Muxing registers like test, emulation, GEMAC Switch (When under reset isolation mode), etc related will not be affected under warm reset conditions.

**Note:** The Bandgap macros for the LDOs will be reset on PORz only.

#### 8.1.7.6 EMAC Switch Reset Isolation

The device will support reset isolation for the Ethernet Switch IP. This allows the device to undergo a warm reset without disrupting the switch or traffic being routed through the switch during the reset condition.

If configured by registers in control module that EMAC reset isolation is active, then behavior is as follows:

Any “Warm” reset source (except the software warm reset) will be blocked to the EMAC switch logic in the IP (the IP has two reset inputs to support such isolation) and to PLL (and its control bits) which is sourcing the EMAC switch clocks as required by the IP (50- or 125-MHz reference clocks). Also, the EMAC switch related IO pins must retain their pin muxing and not glitch (continuously controlled by the EMAC switch IP) by blocking reset to the controlling register bits.

If configured by registers in control module that EMAC reset isolation is NOT active (default state), then the warm reset sources are allowed to propagate as normal including to the EMAC Switch IP (both reset inputs to the IP).

All cold or POR resets will always propagate to the EMAC switch IP as normal (as otherwise defined in this document).

#### 8.1.7.7 Reset Priority

If more than one of these reset sources are asserted simultaneously then the following priority order should be used:

1. POR
2. TRSTz
3. External warm reset
4. Emulation
5. Reset requestors
6. Software resets

#### 8.1.7.8 Trace Functionality Across Reset

Other than POR, TRSTz and SW cold reset, none of the other resets will affect trace functionality. This requires that Debug\_SS has required reset isolation for the trace logic. Also the los and muxing control (if any) for trace los should not get affected by any other reset. Since none of the PLLs getting reset with other resets, clocks will be any way stable.

#### 8.1.7.9 RTC PORz

AM335x supports RTC only mode by supplying dedicated power to RTC module. The RTC module has a dedicated PORz signal (RTC\_PORz) to reset RTC logic and circuitry during powerup. RTC\_PORz is expected to be driven low when the RTC power supply is ramping up. After the power supply reaches its stable value, the RTC\_PORz can be de-asserted. The RTC module is not affected by the device PORz. Similarly RTC\_PORz does not affect the device reset.

If the RTC-only mode is not required, then PORz and RTC\_PORz needs to be shorted. For power-up sequencing with respect to RTC\_PORz, see the device specific datasheet.

### 8.1.8 Power-Up/Down Sequence

Each power domain has dedicated warm and cold reset.

Warm reset gets asserted each time there is any warm reset source requesting reset. Warm reset is also asserted when power domain moves from ON to OFF state.

Cold reset for the domain is asserted in response to cold reset sources. When domain moves from OFF to ON state then also cold reset gets asserted as this is similar to power-up condition for that domain.

### 8.1.9 IO State

All IOs except for JTAG i/f and Reset output (and any special cases mentioned in pinlist) should have their output drivers tri-state and internal pulls enabled during assertion of all reset sources. JTAG i/f IO is affected only by TRSTz.

**Note:** The PRUs and Cortex M3 processor are held under reset after global warm reset by assertion of software source of reset. Other domains are held under reset after global warm reset until the MPU software enables their respective interface clock.

### 8.1.10 Voltage and Power Domains

The following table shows how the device core logic is partitioned into two core logic voltage domains and four power domains. The table lists which voltage and power domain a functional module belongs to.

**Table 8-26. Core Logic Voltage and Power Domains**

Logic Voltage Domain Name	Module
CORE	All Core Modules
RTC	RTC

### 8.1.10.1 Voltage Domains

The core logic is divided into two voltage domains: VDD\_CORE and VDD\_RTC.

### 8.1.10.2 Power Domains

In order to reduce power due to leakage, the core logic supply voltage to 4 of these power domains can be turned OFF with internal power switches. The internal power switches are controlled through memory mapped registers in Control Module.

In a use case whereby all the modules within a power domain are not used that power domain can be placed in the OFF state.

Error: Reference source not found shows the allowable combination power domain ON/OFF states and which power domains are switched via internal power switches. At power-on-reset, all domains except always-on will be in the power domain OFF state.

**Table 8-27. Power Domain State Table**

MODE	POWER DOMAIN					
	WAKEUP	MPU	GFX	PER	RTC	EFUSE
No Voltage Supply	N/A	N/A	N/A	N/A	N/A	N/A
Power On Reset	ON	OFF	OFF	OFF	OFF	OFF
ALL OTHER FUNCTIONAL MODES	ON	DON'T CARE	DON'T CARE	DON'T CARE	DON'T CARE	DON'T CARE
Internal Power Switch	NO	YES	YES	YES	YES	YES

### 8.1.11.1 Power Domain Power Down Sequence

The following sequence of steps happen during the power down of a power domain

All IPs (belonging to a power domain) with STANDBY interface will assert STANDBY. STANDBY assertion should get triggered by IP based on its activity on OCP initiator port. IP should assert STANDBY whenever initiator port is IDLE. Some of the IPs may not have this feature and they will require SW write to standby-mode register to get STANDBY assertion from IP.

1. SW will request all modules in given power domain to go to disable state by programming module control register inside PRCM.
2. PRCM will start and wait for completion of power management handshake with IPs (IdleReq/IdleAck).
3. PRCM will gate-off all the clocks to the power domain.
4. SW will request all clock domains in given power domain to go to “force sleep” mode by programming functional clock domain register in PRCM. Note that PRCM has already gated-off clocks and this register programming may look redundant.
5. SW will request PRCM to take this power domain to OFF state by programming PWRSTCTRL register. Note that this step can be skipped if PWRSTCTRL is permanently programmed to OFF state. When this is done, functional clock domain register decides when power domain will be taken to OFF state. Only reason not to have OFF state in PWRSTCTRL is to take power domain to just clock gate state without power gating.
6. PSCON specific to this power domain will assert isolation enable for the domain.
7. PRCM will assert warm and cold reset to the power domain.
8. PSCON will assert control signals to switch-off power using on-die switches.
9. On-die switches will send acknowledge back to PSCON.

### 8.1.11.2 Power Domain Power-Up Sequence

The following sequence of steps occurs during power-up of a power domain. This sequence is not relevant to always-on domain as this domain will never go to OFF state as long as the device is powered. This sequence will be repeated each time a domain is taken to ON state from OFF (including first time power-up). Note that some of the details are intentionally taken out here to simplify things.

There can be multiple reasons to start power-up sequence for a domain. For example it can be due to an interrupt from one of the IPs which is powered-up.

1. SW will request required clock domains inside this power domain to go to force wake-up state by programming functional clock domain register.
2. PRCM will enable clocks to the required clock domains.
3. PSCON specific to this power domain will assert control signal to un-gate the power.
4. Once power is un-gated, on die switches will send acknowledge back to PSCON.
5. PRCM will de-assert cold and warm reset to the power domain.
6. PRCM will turn-off isolation cells.
7. SW will request PRCM to enable required module in the power domain by programming module control register.
8. PRCM will initiate and wait for completion of PM protocol to enable the modules (IdleReq/IdleAck).

## 8.1.12 Clock Module Registers

### 8.1.12.1 CM\_PER Registers

Table 8-29 lists the memory-mapped registers for the CM\_PER. All register offset addresses not listed in Table 8-29 should be considered as reserved locations and the register contents should not be modified.

### 8.1.12.1.1 CM\_PER\_L4LS\_CLKSTCTRL Register (offset = 0h) [reset = C0102h]

CM\_PER\_L4LS\_CLKSTCTRL is shown in Figure 8-23 and described in Table 8-30.

This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-PER and ON-INPER states. It also hold one status bit per clock input of the domain.

7-2	Reserved	R	0h	
1-0	CLKTRCTRL	R/W	2h	Controls the clock state transition of the L4 SLOW clock domain in PER power domain. 0x0 = NO_SLEEP : NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. 0x1 = SW_SLEEP : SW_SLEEP: Start a software forced sleep transition on the domain. 0x2 = SW_WKUP : SW_WKUP: Start a software forced wake-up transition on the domain. 0x3 = Reserved : Reserved.

**8.1.12.1.2 CM\_PER\_L3S\_CLKSTCTRL Register (offset = 4h) [reset = Ah]**

CM\_PER\_L3S\_CLKSTCTRL is shown in Figure 8-24 and described in Table 8-31.

This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

**Figure 8-24. CM\_PER\_L3S\_CLKSTCTRL Register**

Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3 = RESERVED : Reserved

### 8.1.12.1.11 CM\_PER\_GPMC\_CLKCTRL Register (offset = 30h) [reset = 30002h]

CM\_PER\_GPMC\_CLKCTRL is shown in [Figure 8-33](#) and described in [Table 8-40](#).

This register manages the GPMC clocks.

**Figure 8-33. CM\_PER\_GPMC\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-40. CM\_PER\_GPMC\_CLKCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-18	Reserved	R	0h	
17-16	IDLEST	R	3h	Module idle status. 0x0 = Func : Module is fully functional, including OCP 0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion 0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock 0x3 = Disable : Module is disabled and cannot be accessed
15-2	Reserved	R	0h	
1-0	MODULEMODE	R/W	2h	Control the way mandatory clocks are managed. 0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1 = RESERVED_1 : Reserved 0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3 = RESERVED : Reserved

**8.1.12.1.12 CM\_PER\_MCASP0\_CLKCTRL Register (offset = 34h) [reset = 30000h]**

 CM\_PER\_MCASP0\_CLKCTRL is shown in [Figure 8-34](#) and described in [Table 8-41](#).

This register manages the MCASP0 clocks.

**Figure 8-34. CM\_PER\_MCASP0\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

As long as in this configuration, power domain sleep transition cannot happen. 0x3 = RESERVED : Reserved

**8.1.12.1.16 CM\_PER\_I2C2\_CLKCTRL Register (offset = 44h) [reset = 30000h]**

CM\_PER\_I2C2\_CLKCTRL is shown in [Figure 8-38](#) and described in [Table 8-45](#).

This register manages the I2C2 clocks.

**Figure 8-38. CM\_PER\_I2C2\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

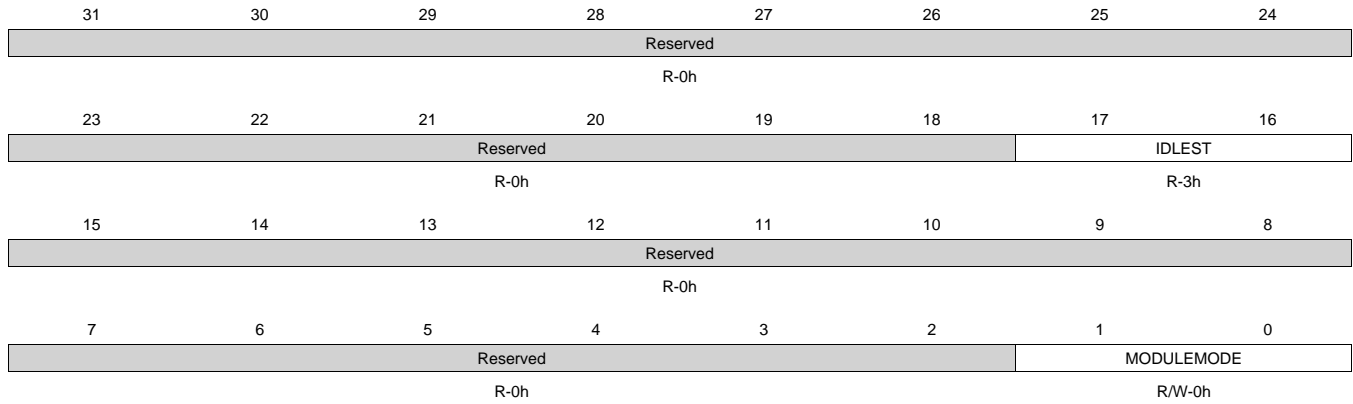

**Table 8-45. CM\_PER\_I2C2\_CLKCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-18	Reserved	R	0h	
17-16	IDLEST	R	3h	Module idle status. 0x0 = Func : Module is fully functional, including OCP 0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion 0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock 0x3 = Disable : Module is disabled and cannot be accessed
15-2	Reserved	R	0h	
1-0	MODULEMODE	R/W	0h	Control the way mandatory clocks are managed. 0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1 = RESERVED_1 : Reserved 0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3 = RESERVED : Reserved

**8.1.12.1.17 CM\_PER\_I2C1\_CLKCTRL Register (offset = 48h) [reset = 30000h]**

 CM\_PER\_I2C1\_CLKCTRL is shown in [Figure 8-39](#) and described in [Table 8-46](#).

This register manages the I2C1 clocks.

**Figure 8-39. CM\_PER\_I2C1\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-46. CM\_PER\_I2C1\_CLKCTRL Register Field Descriptions**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-80. CM\_PER\_SPINLOCK\_CLKCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-18	Reserved	R	0h	
17-16	IDLEST	R	3h	Module idle status. 0x0 = Func : Module is fully functional, including OCP 0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion 0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock 0x3 = Disable : Module is disabled and cannot be accessed
15-2	Reserved	R	0h	
1-0	MODULEMODE	R/W	0h	Control the way mandatory clocks are managed. 0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1 = RESERVED_1 : Reserved 0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3 = RESERVED : Reserved

**8.1.12.1.52 CM\_PER\_MAILBOX0\_CLKCTRL Register (offset = 110h) [reset = 30000h]**

CM\_PER\_MAILBOX0\_CLKCTRL is shown in [Figure 8-74](#) and described in [Table 8-81](#).

This register manages the MAILBOX0 clocks.

**Figure 8-74. CM\_PER\_MAILBOX0\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

### 8.1.12.2.2 CM\_WKUP\_CONTROL\_CLKCTRL Register (offset = 4h) [reset = 30000h]

CM\_WKUP\_CONTROL\_CLKCTRL is shown in [Figure 8-85](#) and described in [Table 8-93](#).

This register manages the Control Module clocks.

**Figure 8-85. CM\_WKUP\_CONTROL\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-93. CM\_WKUP\_CONTROL\_CLKCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	Reserved	R	0h	
18	Reserved	R	0h	
17-16	IDLEST	R	3h	Module idle status. 0x0 = Func : Module is fully functional, including OCP 0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion 0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock 0x3 = Disable : Module is disabled and cannot be accessed
15-2	Reserved	R	0h	
1-0	MODULEMODE	R/W	0h	Control the way mandatory clocks are managed. 0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1 = RESERVED_1 : Reserved 0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3 = RESERVED : Reserved

### 8.1.12.2.3 CM\_WKUP\_GPIO0\_CLKCTRL Register (offset = 8h) [reset = 30000h]

CM\_WKUP\_GPIO0\_CLKCTRL is shown in [Figure 8-86](#) and described in [Table 8-94](#).

This register manages the GPIO0 clocks.

**Figure 8-86. CM\_WKUP\_GPIO0\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-94. CM\_WKUP\_GPIO0\_CLKCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	Reserved	R	0h	
18	OPTFCLKEN_GPIO0_GDBCLK	R/W	0h	Optional functional clock control. 0x0 = FCLK_DIS : Optional functional clock is disabled 0x1 = FCLK_EN : Optional functional clock is enabled
17-16	IDLEST	R	3h	Module idle status. 0x0 = Func : Module is fully functional, including OCP 0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion 0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock 0x3 = Disable : Module is disabled and cannot be accessed
15-2	Reserved	R	0h	
1-0	MODULEMODE	R/W	0h	Control the way mandatory clocks are managed. 0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1 = RESERVED_1 : Reserved 0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3 = RESERVED : Reserved

### 8.1.12.2.4 CM\_WKUP\_L4WKUP\_CLKCTRL Register (offset = Ch) [reset = 2h]

CM\_WKUP\_L4WKUP\_CLKCTRL is shown in [Figure 8-87](#) and described in [Table 8-95](#).

This register manages the L4WKUP clocks.

**Figure 8-87. CM\_WKUP\_L4WKUP\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-95. CM\_WKUP\_L4WKUP\_CLKCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	Reserved	R	0h	
18	Reserved	R	0h	
17-16	IDLEST	R	0h	Module idle status. 0x0 = Func : Module is fully functional, including OCP 0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion 0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock 0x3 = Disable : Module is disabled and cannot be accessed
15-2	Reserved	R	0h	
1-0	MODULEMODE	R	2h	Control the way mandatory clocks are managed.

**8.1.12.2.5 CM\_WKUP\_TIMER0\_CLKCTRL Register (offset = 10h) [reset = 30002h]**

CM\_WKUP\_TIMER0\_CLKCTRL is shown in Figure 8-88 and described in Table 8-96.

This register manages the TIMER0 clocks.

**Figure 8-88. CM\_WKUP\_TIMER0\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-107. CM\_SSC\_MODFREQDIV\_DPLL\_DDR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-11	Reserved	R	0h	
10-8	MODFREQDIV_EXPONENT	R/W	0h	Set the Exponent component of MODFREQDIV factor
7	Reserved	R	0h	
6-0	MODFREQDIV_MANTISSA	R/W	0h	Set the Mantissa component of MODFREQDIV factor

**8.1.12.2.17 CM\_CLKSEL\_DPLL\_DDR Register (offset = 40h) [reset = 0h]**

CM\_CLKSEL\_DPLL\_DDR is shown in Figure 8-100 and described in Table 8-108.

This register provides controls over the DPLL.

**Figure 8-100. CM\_CLKSEL\_DPLL\_DDR Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-108. CM\_CLKSEL\_DPLL\_DDR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	Reserved	R	0h	
23	DPLL_BYP_CLKSEL	R/W	0h	Select CLKINP orr CLKINPULOW as bypass clock 0x0 = Sel0 : Selects CLKINP Clock as BYPASS Clock 0x1 = Sel1 : Selects CLKINPULOW as Bypass Clock
22-19	Reserved	R	0h	
18-8	DPLL_MULT	R/W	0h	DPLL multiplier factor (2 to 2047). This register is automatically cleared to 0 when the DPLL_EN field in the *CLKMODE_DPLL* register is set to select MN Bypass mode. (equal to input M of DPLL M=2 to 2047 => DPLL multiplies by M). 0x0 = 0 : Reserved 0x1 = 1 : Reserved
7	Reserved	R	0h	
6-0	DPLL_DIV	R/W	0h	DPLL divider factor (0 to 127) (equal to input N of DPLL actual division factor is N+1).

**8.1.12.2.18 CM\_AUTOIDLE\_DPLL\_DISP Register (offset = 44h) [reset = 0h]**

CM\_AUTOIDLE\_DPLL\_DISP is shown in [Figure 8-101](#) and described in [Table 8-109](#).

This register provides automatic control over the DPLL activity.

**Figure 8-101. CM\_AUTOIDLE\_DPLL\_DISP Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

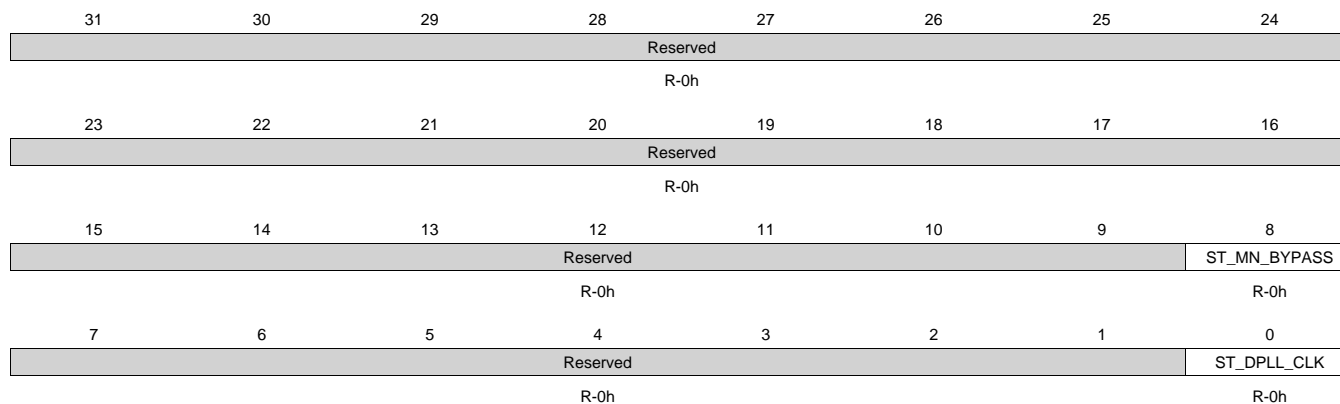

**Table 8-109. CM\_AUTOIDLE\_DPLL\_DISP Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2-0	AUTO_DPLL_MODE	R/W	0h	AUTO_DPLL_MODE is not supported.

**8.1.12.2.19 CM\_IDLEST\_DPLL\_DISP Register (offset = 48h) [reset = 0h]**

CM\_IDLEST\_DPLL\_DISP is shown in [Figure 8-102](#) and described in [Table 8-110](#).

This register allows monitoring the master clock activity. This register is read only and automatically updated. [warm reset insensitive]

**Figure 8-102. CM\_IDLEST\_DPLL\_DISP Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-110. CM\_IDLEST\_DPLL\_DISP Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-9	Reserved	R	0h	
8	ST_MN_BYPASS	R	0h	DPLL MN_BYPASS status 0x0 = NO_MNBYPASS : DPLL is not in MN_Bypass 0x1 = MN_BYPASS : DPLL is in MN_Bypass
7-1	Reserved	R	0h	
0	ST_DPLL_CLK	R	0h	DPLL clock activity 0x0 = DPLL_UNLOCKED : DPLL is either in bypass mode or in stop mode. 0x1 = DPLL_LOCKED : DPLL is LOCKED

**8.1.12.2.20 CM\_SSC\_DELTAMSTEP\_DPLL\_DISP Register (offset = 4Ch) [reset = 0h]**

CM\_SSC\_DELTAMSTEP\_DPLL\_DISP is shown in [Figure 8-103](#) and described in [Table 8-111](#).

Control the DeltaMStep parameter for Spread Spectrum Clocking technique DeltaMStep is split into fractional and integer part. [warm reset insensitive]

**Figure 8-103. CM\_SSC\_DELTAMSTEP\_DPLL\_DISP Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

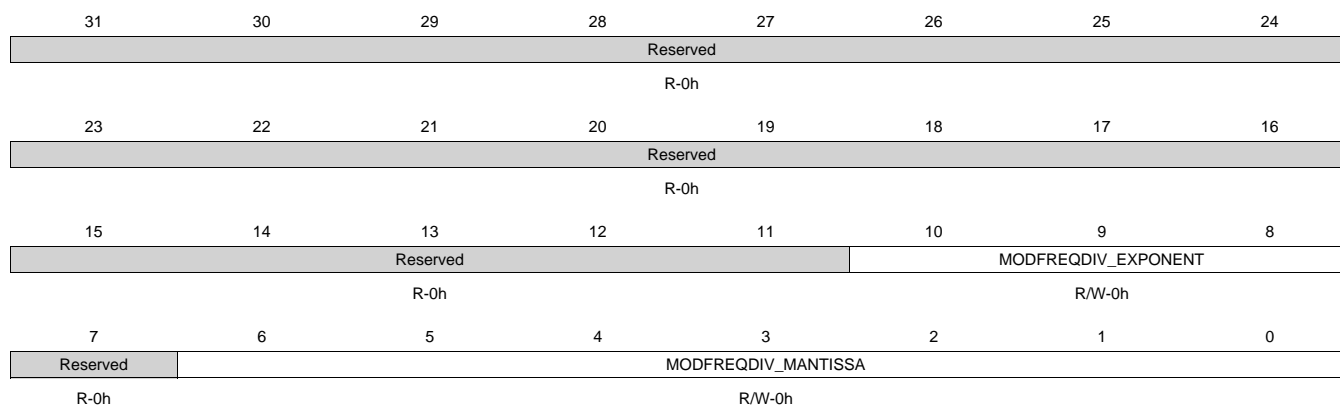

**Table 8-111. CM\_SSC\_DELTAMSTEP\_DPLL\_DISP Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-20	Reserved	R	0h	
19-18	DELTAMSTEP_INTEGER	R/W	0h	Integer part for DeltaM coefficient
17-0	DELTAMSTEP_FRACTION	R/W	0h	Fractional setting for DeltaMStep parameter

**8.1.12.2.21 CM\_SSC\_MODFREQDIV\_DPLL\_DISP Register (offset = 50h) [reset = 0h]**

CM\_SSC\_MODFREQDIV\_DPLL\_DISP is shown in Figure 8-104 and described in Table 8-112.

Control the Modulation Frequency (Fm) for Spread Spectrum Clocking technique by defining it as a ratio of DPLL\_REFCLK/4 Fm = [DPLL\_REFCLK/4]/MODFREQDIV MODFREQDIV = MODFREQDIV\_MANTISSA \* 2<sup>MODFREQDIV\_EXPONENT</sup> [warm reset insensitive]

**Figure 8-104. CM\_SSC\_MODFREQDIV\_DPLL\_DISP Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Bit	Field	Type	Reset	Description
31-11	Reserved	R	0h	
10-8	MODFREQDIV_EXPONENT	R/W	0h	Set the Exponent component of MODFREQDIV factor
7	Reserved	R	0h	
6-0	MODFREQDIV_MANTISSA	R/W	0h	Set the Mantissa component of MODFREQDIV factor

**8.1.12.2.22 CM\_CLKSEL\_DPLL\_DISP Register (offset = 54h) [reset = 0h]**

CM\_CLKSEL\_DPLL\_DISP is shown in [Figure 8-105](#) and described in [Table 8-113](#).

This register provides controls over the DPLL.

**Figure 8-105. CM\_CLKSEL\_DPLL\_DISP Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

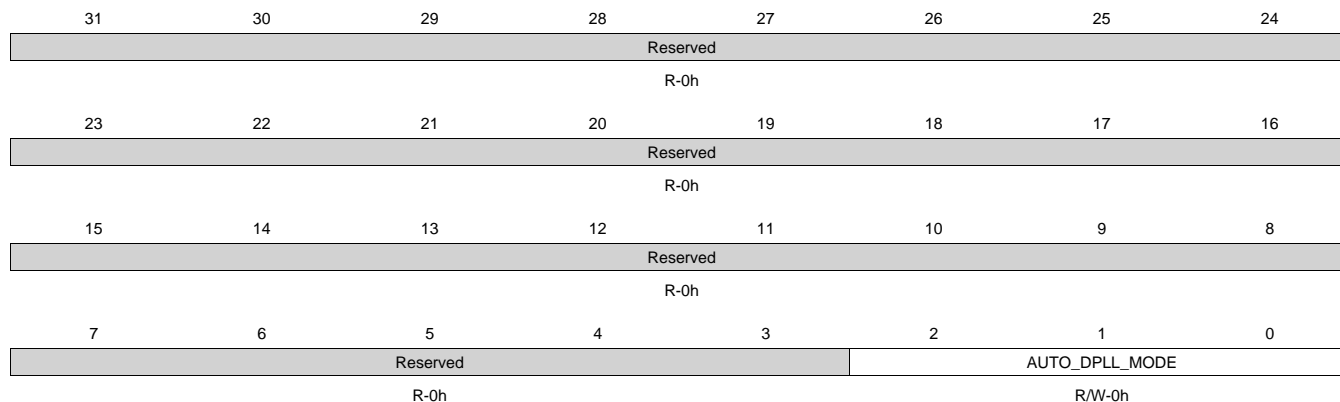

**Table 8-113. CM\_CLKSEL\_DPLL\_DISP Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	Reserved	R	0h	
23	DPLL_BYP_CLKSEL	R/W	0h	Select CLKINP or CLKINPULOW as bypass clock 0x0 = Sel0 : Selects CLKINP Clock as BYPASS Clock 0x1 = Sel1 : Selects CLKINPULOW as Bypass Clock
22-19	Reserved	R	0h	
18-8	DPLL_MULT	R/W	0h	DPLL multiplier factor (2 to 2047). This register is automatically cleared to 0 when the DPLL_EN field in the *CLKMODE_DPLL* register is set to select MN Bypass mode. (equal to input M of DPLL M=2 to 2047 => DPLL multiplies by M). 0x0 = 0 : Reserved 0x1 = 1 : Reserved
7	Reserved	R	0h	
6-0	DPLL_DIV	R/W	0h	DPLL divider factor (0 to 127) (equal to input N of DPLL actual division factor is N+1).

**8.1.12.2.23 CM\_AUTOIDLE\_DPLL\_CORE Register (offset = 58h) [reset = 0h]**

CM\_AUTOIDLE\_DPLL\_CORE is shown in [Figure 8-106](#) and described in [Table 8-114](#).

This register provides automatic control over the DPLL activity.

**Figure 8-106. CM\_AUTOIDLE\_DPLL\_CORE Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Bit	Field	Type	Reset	Description
31-11	Reserved	R	0h	
10-8	MODFREQDIV_EXPONENT	R/W	0h	Set the Exponent component of MODFREQDIV factor
7	Reserved	R	0h	
6-0	MODFREQDIV_MANTISSA	R/W	0h	Set the Mantissa component of MODFREQDIV factor

**8.1.12.2.32 CM\_CLKDCOLDO\_DPLL\_PER Register (offset = 7Ch) [reset = 0h]**

CM\_CLKDCOLDO\_DPLL\_PER is shown in [Figure 8-115](#) and described in [Table 8-123](#).

This register provides controls over the digitally controlled oscillator output of the PER DPLL.

**Figure 8-115. CM\_CLKDCOLDO\_DPLL\_PER Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

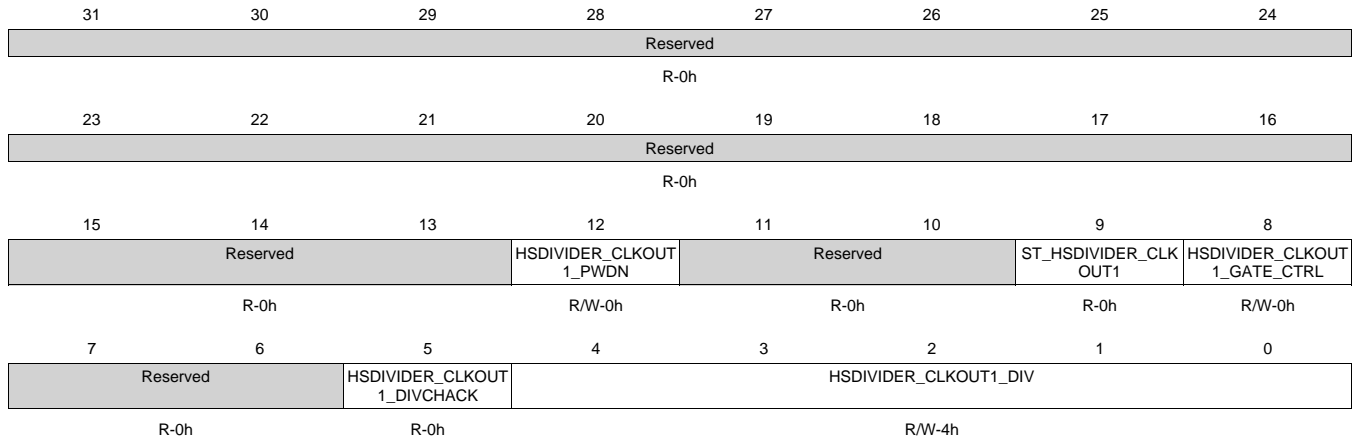

**Table 8-123. CM\_CLKDCOLDO\_DPLL\_PER Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-13	Reserved	R	0h	
12	DPLL_CLKDCOLDO_PWDN	R/W	0h	Automatic power down for CLKDCOLDO o/p when it is gated 0x0 = ALWAYS_ACTIVE : Keep CLKDCOLDO o/p powered on even when it is gated 0x1 = AUTO_PWDN : Automatically power down CLKDCOLDO o/p when it is gated.
11-10	Reserved	R	0h	
9	ST_DPLL_CLKDCOLDO	R	0h	DPLL CLKDCOLDO status 0x0 = CLK_ENABLED : The clock output is enabled 0x1 = CLK_GATED : The clock output is gated
8	DPLL_CLKDCOLDO_GATE_CTRL	R/W	0h	Control gating of DPLL CLKDCOLDO 0x0 = CLK_AUTOGATE : Automatically gate this clock when there is no dependency for it 0x1 = CLK_ENABLE : Force this clock to stay enabled even if there is no request
7-0	Reserved	R	0h	

**8.1.12.2.33 CM\_DIV\_M4\_DPLL\_CORE Register (offset = 80h) [reset = 4h]**

CM\_DIV\_M4\_DPLL\_CORE is shown in [Figure 8-116](#) and described in [Table 8-124](#).

This register provides controls over the CLKOUT1 o/p of the HSDIVIDER.

**Figure 8-116. CM\_DIV\_M4\_DPLL\_CORE Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-124. CM\_DIV\_M4\_DPLL\_CORE Register Field Descriptions**

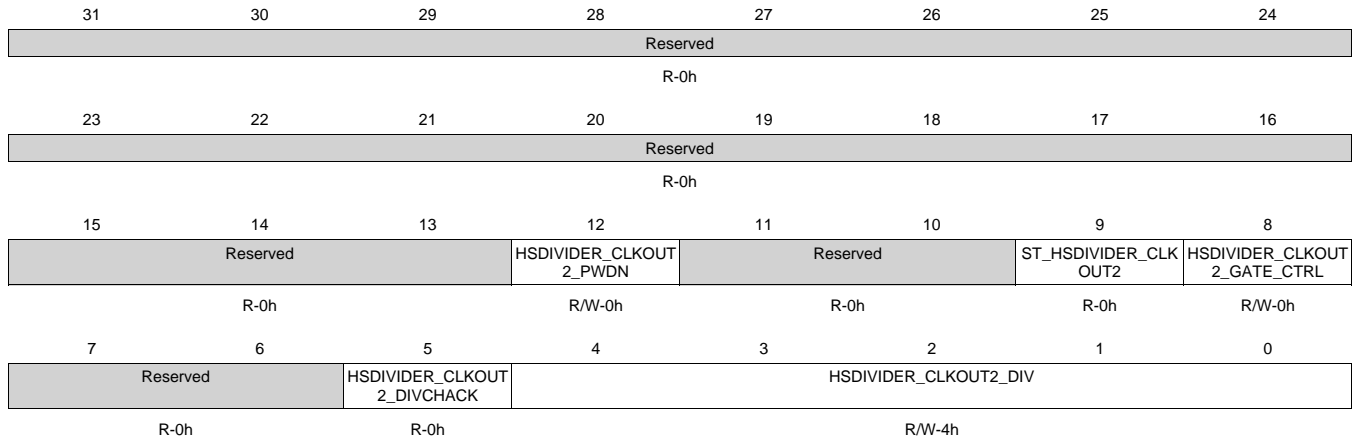

Bit	Field	Type	Reset	Description
31-13	Reserved	R	0h	
12	HSDIVIDER_CLKOUT1_PWDN	R/W	0h	Automatic power down for HSDIVIDER M4 divider and hence CLKOUT1 output when the o/p clock is gated. 0x0 = ALWAYS_ACTIVE : Keep M4 divider powered on even when CLKOUT1 is gated. 0x1 = AUTO_PWDN : Automatically power down M4 divider when CLKOUT1 is gated.
11-10	Reserved	R	0h	
9	ST_HSDIVIDER_CLKOUT1	R	0h	HSDIVIDER CLKOUT1 status 0x0 = CLK_ENABLED : The clock output is enabled 0x1 = CLK_GATED : The clock output is gated
8	HSDIVIDER_CLKOUT1_GATE_CTRL	R/W	0h	Control gating of HSDIVIDER CLKOUT1 0x0 = CLK_AUTOGATE : Automatically gate this clock when there is no dependency for it 0x1 = CLK_ENABLE : Force this clock to stay enabled even if there is no request
7-6	Reserved	R	0h	
5	HSDIVIDER_CLKOUT1_DIVCHACK	R	0h	Toggle on this status bit after changing HSDIVIDER_CLKOUT1_DIV indicates that the change in divider value has taken effect
4-0	HSDIVIDER_CLKOUT1_DIV	R/W	4h	DPLL post-divider factor, M4, for internal clock generation. Divide values from 1 to 31.

**8.1.12.2.34 CM\_DIV\_M5\_DPLL\_CORE Register (offset = 84h) [reset = 4h]**

CM\_DIV\_M5\_DPLL\_CORE is shown in [Figure 8-117](#) and described in [Table 8-125](#).

This register provides controls over the CLKOUT2 o/p of the HSDIVIDER.

**Figure 8-117. CM\_DIV\_M5\_DPLL\_CORE Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-125. CM\_DIV\_M5\_DPLL\_CORE Register Field Descriptions**

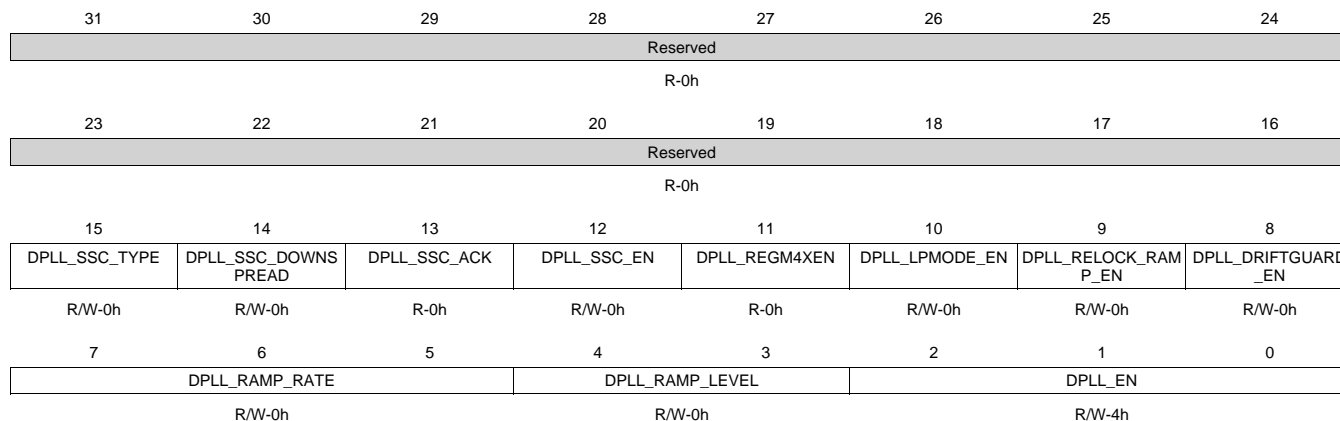

Bit	Field	Type	Reset	Description
31-13	Reserved	R	0h	
12	HSDIVIDER_CLKOUT2_PWDN	R/W	0h	Automatic power down for HSDIVIDER M5 divider and hence CLKOUT2 output when the o/p clock is gated. 0x0 = ALWAYS_ACTIVE : Keep M5 divider powered on even when CLKOUT2 is gated. 0x1 = AUTO_PWDN : Automatically power down M5 divider when CLKOUT2 is gated.
11-10	Reserved	R	0h	
9	ST_HSDIVIDER_CLKOUT2	R	0h	HSDIVIDER CLKOUT2 status 0x0 = CLK_ENABLED : The clock output is enabled 0x1 = CLK_GATED : The clock output is gated
8	HSDIVIDER_CLKOUT2_GATE_CTRL	R/W	0h	Control gating of HSDIVIDER CLKOUT2 0x0 = CLK_AUTOGATE : Automatically gate this clock when there is no dependency for it 0x1 = CLK_ENABLE : Force this clock to stay enabled even if there is no request
7-6	Reserved	R	0h	
5	HSDIVIDER_CLKOUT2_DIVCHACK	R	0h	Toggle on this status bit after changing HSDIVIDER_CLKOUT2_DIV indicates that the change in divider value has taken effect
4-0	HSDIVIDER_CLKOUT2_DIV	R/W	4h	DPLL post-divider factor, M5, for internal clock generation. Divide values from 1 to 31.

**8.1.12.2.35 CM\_CLKMODE\_DPLL\_MPU Register (offset = 88h) [reset = 4h]**

CM\_CLKMODE\_DPLL\_MPU is shown in [Figure 8-118](#) and described in [Table 8-126](#).

This register allows controlling the DPLL modes.

**Figure 8-118. CM\_CLKMODE\_DPLL\_MPU Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-126. CM\_CLKMODE\_DPLL\_MPU Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	Reserved	R	0h	
15	DPLL_SSC_TYPE	R/W	0h	Select Triangular Spread Spectrum clocking. Always write 0. 0 = Triangular Spread Spectrum Clocking is selected. 1 = Reserved.
14	DPLL_SSC_DOWNSPREAD	R/W	0h	Control if only low frequency spread is required 0x0 = FULL_SPREAD : When SSC is enabled, clock frequency is spread on both sides of the programmed frequency 0x1 = LOW_SPREAD : When SSC is enabled, clock frequency is spread only on the lower side of the programmed frequency
13	DPLL_SSC_ACK	R	0h	Acknowledgement from the DPLL regarding start and stop of Spread Spectrum Clocking feature 0x0 = Disabled : SSC has been turned off on PLL o/ps 0x1 = Enabled : SSC has been turned on on PLL o/ps
12	DPLL_SSC_EN	R/W	0h	Enable or disable Spread Spectrum Clocking 0x0 = Disabled : SSC disabled 0x1 = Enabled : SSC enabled
11	DPLL_REGM4XEN	R	0h	Enable the REGM4XEN mode of the DPLL. Please check the DPLL documentation to check when this mode can be enabled.
10	DPLL_LPMODE_EN	R/W	0h	Set the DPLL in Low Power mode. Check the DPLL documentation to see when this can be enabled. 0x0 = DISABLED : Low power mode of the DPLL is disabled 0x1 = ENABLED : Low power mode of the DPLL is enabled
9	DPLL_RELOCK_RAM_P_EN	R/W	0h	If enabled, the clock ramping feature is used applied during the lock process, as well as the relock process. If disabled, the clock ramping feature is used only during the first lock.

**Table 8-126. CM\_CLKMODE\_DPLL\_MPU Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
8	DPLL_DRIFTGUARD_EN	R/W	0h	This bit allows to enable or disable the automatic recalibration feature of the DPLL. The DPLL will automatically start a recalibration process upon assertion of the DPLL's RECAL flag if this bit is set. 0x0 = Disabled : DRIFTGUARD feature is disabled 0x1 = Enabled : DRIFTGUARD feature is enabled
7-5	DPLL_RAMP_RATE	R/W	0h	Selects the time in terms of DPLL REFCLKs spent at each stage of the clock ramping process 0x0 = REFCLKx2 : 2 REFCLKs 0x1 = REFCLKx4 : 4 REFCLKs 0x2 = REFCLKx8 : 8 REFCLKs 0x3 = REFCLKx16 : 16 REFCLKs 0x4 = REFCLKx32 : 32 REFCLKs 0x5 = REFCLKx64 : 64 REFCLKs 0x6 = REFCLKx128 : 128 REFCLKs 0x7 = REFCLKx512 : 512 REFCLKs
4-3	DPLL_RAMP_LEVEL	R/W	0h	The DPLL provides an output clock frequency ramping feature when switching from bypass clock to normal clock during lock and re-lock. The frequency ramping will happen in a maximum of 4 steps in frequency before the DPLL's frequency lock indicator is asserted. This register is used to enable/disable the DPLL ramping feature. If enabled, it is also used to select the algorithm used for clock ramping 0x0 = RAMP_DISABLE : CLKOUT => No ramping CLKOUTX2 => No ramping 0x1 = RAMP_ALGO1 : CLKOUT => Bypass clk -> Fout/8 -> Fout/4 -> Fout/2 -> Fout CLKOUTX2 => Bypass clk -> Foutx2/8 -> Foutx2/4 -> Foutx2/2 -> Foutx2 0x2 = RAMP_ALGO2 : CLKOUT => Bypass clk -> Fout/4 -> Fout/2 -> Fout/1.5 -> Fout CLKOUTX2 => Bypass clk -> Foutx2/4 -> Foutx2/2 -> Foutx2/1.5 -> Foutx2 0x3 = Reserved : Reserved
2-0	DPLL_EN	R/W	4h	DPLL control. Upon Warm Reset, the PRCM DPLL control state machine updates this register to reflect MN Bypass mode. 0x0 = Reserved : Reserved 0x1 = Reserved1 : Reserved 0x2 = Reserved2 : Reserved 0x3 = Reserved3 : Reserved 0x4 = DPLL_MN_BYP_MODE : Put the DPLL in MN Bypass mode. The DPLL_MULT register bits are reset to 0 automatically by putting the DPLL in this mode. 0x5 = DPLL_LP_BYP_MODE : Put the DPLL in Idle Bypass Low Power mode. 0x6 = DPLL_FR_BYP_MODE : Put the DPLL in Idle Bypass Fast Rerlock mode. 0x7 = DPLL_LOCK_MODE : Enables the DPLL in Lock mode

**8.1.12.2.36 CM\_CLKMODE\_DPLL\_PER Register (offset = 8Ch) [reset = 4h]**

 CM\_CLKMODE\_DPLL\_PER is shown in [Figure 8-119](#) and described in [Table 8-127](#).

This register allows controlling the DPLL modes.

### 8.1.12.2.40 CM\_CLKSEL\_DPLL\_PERIPH Register (offset = 9Ch) [reset = 0h]

CM\_CLKSEL\_DPLL\_PERIPH is shown in Figure 8-123 and described in Table 8-131.

This register provides controls over the DPLL.

**Figure 8-123. CM\_CLKSEL\_DPLL\_PERIPH Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-131. CM\_CLKSEL\_DPLL\_PERIPH Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	DPLL_SD_DIV	R/W	0h	Sigma-Delta divider select (2-255). This factor must be set by s/w to ensure optimum jitter performance. $DPLL\_SD\_DIV = CEILING([DPLL\_MULT/(DPLL\_DIV+1)] * CLKINP / 250)$ , where CLKINP is the input clock of the DPLL in MHz). Must be set with M and N factors, and must not be changed once DPLL is locked. 0x0 = Reserved : Reserved 0x1 = Reserved1 : Reserved
23	Reserved	R	0h	
22-20	Reserved	R	0h	
19-8	DPLL_MULT	R/W	0h	DPLL multiplier factor (2 to 4095). This register is automatically cleared to 0 when the DPLL_EN field in the *CLKMODE_DPLL* register is set to select MN Bypass mode. (equal to input M of DPLL M=2 to 4095 => DPLL multiplies by M). 0x0 = 0 : Reserved 0x1 = 1 : Reserved
7-0	DPLL_DIV	R/W	0h	DPLL divider factor (0 to 255) (equal to input N of DPLL actual division factor is N+1).

**8.1.12.2.41 CM\_DIV\_M2\_DPLL\_DDR Register (offset = A0h) [reset = 1h]**

CM\_DIV\_M2\_DPLL\_DDR is shown in [Figure 8-124](#) and described in [Table 8-132](#).

This register provides controls over the M2 divider of the DPLL.

**Figure 8-124. CM\_DIV\_M2\_DPLL\_DDR Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-132. CM\_DIV\_M2\_DPLL\_DDR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-10	Reserved	R	0h	
9	ST_DPLL_CLKOUT	R	0h	DPLL CLKOUT status 0x0 = CLK_GATED : The clock output is gated 0x1 = CLK_ENABLED : The clock output is enabled
8	DPLL_CLKOUT_GATE_CTRL	R/W	0h	Control gating of DPLL CLKOUT 0x0 = CLK_AUTOGATE : Automatically gate this clock when there is no dependency for it 0x1 = CLK_ENABLE : Force this clock to stay enabled even if there is no request
7-6	Reserved	R	0h	
5	DPLL_CLKOUT_DIVCHACK	R	0h	Toggle on this status bit after changing DPLL_CLKOUT_DIV indicates that the change in divider value has taken effect
4-0	DPLL_CLKOUT_DIV	R/W	1h	DPLL M2 post-divider factor (1 to 31).

### 8.1.12.2.42 CM\_DIV\_M2\_DPLL\_DISP Register (offset = A4h) [reset = 1h]

CM\_DIV\_M2\_DPLL\_DISP is shown in Figure 8-125 and described in Table 8-133.

This register provides controls over the M2 divider of the DPLL.

**Figure 8-125. CM\_DIV\_M2\_DPLL\_DISP Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

9	ST_DPLL_CLKOUT	R	0h	DPLL CLKOUT status 0x0 = CLK_GATED : The clock output is gated 0x1 = CLK_ENABLED : The clock output is enabled
8	DPLL_CLKOUT_GATE_CTRL	R/W	0h	Control gating of DPLL CLKOUT 0x0 = CLK_AUTOGATE : Automatically gate this clock when there is no dependency for it 0x1 = CLK_ENABLE : Force this clock to stay enabled even if there is no request
7-6	Reserved	R	0h	
5	DPLL_CLKOUT_DIVCHACK	R	0h	Toggle on this status bit after changing DPLL_CLKOUT_DIV indicates that the change in divider value has taken effect
4-0	DPLL_CLKOUT_DIV	R/W	1h	DPLL M2 post-divider factor (1 to 31).

### 8.1.12.2.44 CM\_DIV\_M2\_DPLL\_PER Register (offset = ACh) [reset = 1h]

CM\_DIV\_M2\_DPLL\_PER is shown in [Figure 8-127](#) and described in [Table 8-135](#).

This register provides controls over the M2 divider of the DPLL.

**Figure 8-127. CM\_DIV\_M2\_DPLL\_PER Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-135. CM\_DIV\_M2\_DPLL\_PER Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-10	Reserved	R	0h	
9	ST_DPLL_CLKOUT	R	0h	DPLL CLKOUT status 0x0 = CLK_GATED : The clock output is gated 0x1 = CLK_ENABLED : The clock output is enabled
8	DPLL_CLKOUT_GATE_CTRL	R/W	0h	Control gating of DPLL CLKOUT 0x0 = CLK_AUTOGATE : Automatically gate this clock when there is no dependency for it 0x1 = CLK_ENABLE : Force this clock to stay enabled even if there is no request
7	DPLL_CLKOUT_DIVCHACK	R	0h	Toggle on this status bit after changing DPLL_CLKOUT_DIV indicates that the change in divider value has taken effect
6-0	DPLL_CLKOUT_DIV	R/W	1h	DPLL M2 post-divider factor (1 to 31).

**8.1.12.2.45 CM\_WKUP\_WKUP\_M3\_CLKCTRL Register (offset = B0h) [reset = 2h]**

CM\_WKUP\_WKUP\_M3\_CLKCTRL is shown in [Figure 8-128](#) and described in [Table 8-136](#).

This register manages the WKUP M3 clocks.

**Figure 8-128. CM\_WKUP\_WKUP\_M3\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-136. CM\_WKUP\_WKUP\_M3\_CLKCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	Reserved	R	0h	
18	STBYST	R	0h	Module standby status. 0x0 = Func : Module is functional (not in standby) 0x1 = Standby : Module is in standby
17-2	Reserved	R	0h	
1-0	MODULEMODE	R	2h	Control the way mandatory clocks are managed.

**8.1.12.2.46 CM\_WKUP\_UART0\_CLKCTRL Register (offset = B4h) [reset = 30000h]**

CM\_WKUP\_UART0\_CLKCTRL is shown in [Figure 8-129](#) and described in [Table 8-137](#).

This register manages the UART0 clocks.

**Figure 8-129. CM\_WKUP\_UART0\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-137. CM\_WKUP\_UART0\_CLKCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-18	Reserved	R	0h	
17-16	IDLEST	R	3h	Module idle status. 0x0 = Func : Module is fully functional, including OCP 0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion 0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock 0x3 = Disable : Module is disabled and cannot be accessed
15-2	Reserved	R	0h	
1-0	MODULEMODE	R/W	0h	Control the way mandatory clocks are managed. 0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1 = RESERVED_1 : Reserved 0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3 = RESERVED : Reserved

**8.1.12.2.47 CM\_WKUP\_I2C0\_CLKCTRL Register (offset = B8h) [reset = 30000h]**

 CM\_WKUP\_I2C0\_CLKCTRL is shown in [Figure 8-130](#) and described in [Table 8-138](#).

This register manages the I2C0 clocks.

**Figure 8-130. CM\_WKUP\_I2C0\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-138. CM\_WKUP\_I2C0\_CLKCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-18	Reserved	R	0h	
17-16	IDLEST	R	3h	Module idle status. 0x0 = Func : Module is fully functional, including OCP 0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion 0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock 0x3 = Disable : Module is disabled and cannot be accessed

Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3 = RESERVED : Reserved

### 8.1.12.2.52 CM\_L4\_WKUP\_AON\_CLKSTCTRL Register (offset = CCh) [reset = 6h]

CM\_L4\_WKUP\_AON\_CLKSTCTRL is shown in [Figure 8-135](#) and described in [Table 8-143](#).

This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

**Figure 8-135. CM\_L4\_WKUP\_AON\_CLKSTCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-143. CM\_L4\_WKUP\_AON\_CLKSTCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-26	Reserved	R	0h	
25-14	Reserved	R	0h	
13-8	Reserved	R	0h	
7-4	Reserved	R	0h	
3	Reserved	R	0h	
2	CLKACTIVITY_L4_WKUP_AON_GCLK	R	1h	This field indicates the state of the L4_WKUP clock in the domain. 0x0 = Inact : Corresponding clock is gated 0x1 = Act : Corresponding clock is active
1-0	CLKTRCTRL	R/W	2h	Controls the clock state transition of the always on L4 clock domain. 0x0 = NO_SLEEP : Sleep transition cannot be initiated. Wakeup transition may however occur. 0x1 = SW_SLEEP : Start a software forced sleep transition on the domain. 0x2 = SW_WKUP : Start a software forced wake-up transition on the domain. 0x3 = Reserved : Reserved.

**8.1.12.2.53 CM\_WKUP\_WDT1\_CLKCTRL Register (offset = D4h) [reset = 30002h]**

CM\_WKUP\_WDT1\_CLKCTRL is shown in [Figure 8-136](#) and described in [Table 8-144](#).

This register manages the WDT1 clocks.

**Figure 8-136. CM\_WKUP\_WDT1\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-144. CM\_WKUP\_WDT1\_CLKCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	Reserved	R	0h	
18	Reserved	R	0h	
17-16	IDLEST	R	3h	Module idle status. 0x0 = Func : Module is fully functional, including OCP 0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion 0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock 0x3 = Disable : Module is disabled and cannot be accessed
15-2	Reserved	R	0h	
1-0	MODULEMODE	R/W	2h	Control the way mandatory clocks are managed. 0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1 = RESERVED_1 : Reserved 0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3 = RESERVED : Reserved

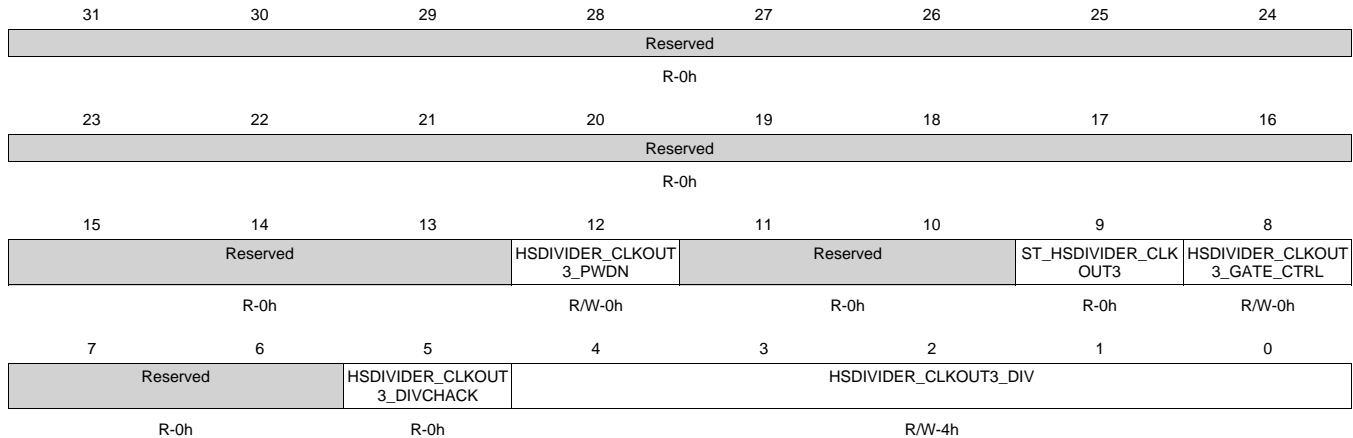

### 8.1.12.2.54 CM\_DIV\_M6\_DPLL\_CORE Register (offset = D8h) [reset = 4h]

CM\_DIV\_M6\_DPLL\_CORE is shown in [Figure 8-137](#) and described in [Table 8-145](#).

This register provides controls over the CLKOUT3 o/p of the HSDIVIDER. [warm reset insensitive]

**Figure 8-137. CM\_DIV\_M6\_DPLL\_CORE Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-145. CM\_DIV\_M6\_DPLL\_CORE Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-13	Reserved	R	0h	
12	HSDIVIDER_CLKOUT3_PWDN	R/W	0h	Automatic power down for HSDIVIDER M6 divider and hence CLKOUT3 output when the o/p clock is gated. 0x0 = ALWAYS_ACTIVE : Keep M6 divider powered on even when CLKOUT3 is gated. 0x1 = AUTO_PWDN : Automatically power down M6 divider when CLKOUT3 is gated.
11-10	Reserved	R	0h	
9	ST_HSDIVIDER_CLKOUT3	R	0h	HSDIVIDER CLKOUT3 status 0x0 = CLK_ENABLED : The clock output is enabled 0x1 = CLK_GATED : The clock output is gated
8	HSDIVIDER_CLKOUT3_GATE_CTRL	R/W	0h	Control gating of HSDIVIDER CLKOUT3 0x0 = CLK_AUTOGATE : Automatically gate this clock when there is no dependency for it 0x1 = CLK_ENABLE : Force this clock to stay enabled even if there is no request
7-6	Reserved	R	0h	
5	HSDIVIDER_CLKOUT3_DIVCHACK	R	0h	Toggle on this status bit after changing HSDIVIDER_CLKOUT3_DIV indicates that the change in divider value has taken effect
4-0	HSDIVIDER_CLKOUT3_DIV	R/W	4h	DPLL post-divider factor, M6, for internal clock generation. Divide values from 1 to 31.

### 8.1.12.3 CM\_DPLL Registers

[Table 8-146](#) lists the memory-mapped registers for the CM\_DPLL. All register offset addresses not listed in [Table 8-146](#) should be considered as reserved locations and the register contents should not be modified.

**Table 8-146. CM\_DPLL REGISTERS**

Offset	Acronym	Register Name	Section
4h	CLKSEL_TIMER7_CLK	Selects the Mux select line for TIMER7 clock [warm reset insensitive]	<a href="#">Section 8.1.12.3.1</a>
8h	CLKSEL_TIMER2_CLK	Selects the Mux select line for TIMER2 clock [warm reset insensitive]	<a href="#">Section 8.1.12.3.2</a>
Ch	CLKSEL_TIMER3_CLK	Selects the Mux select line for TIMER3 clock [warm reset insensitive]	<a href="#">Section 8.1.12.3.3</a>
10h	CLKSEL_TIMER4_CLK	Selects the Mux select line for TIMER4 clock [warm reset insensitive]	<a href="#">Section 8.1.12.3.4</a>
14h	CM_MAC_CLKSEL	Selects the clock divide ration for MII clock [warm reset insensitive]	<a href="#">Section 8.1.12.3.5</a>
18h	CLKSEL_TIMER5_CLK	Selects the Mux select line for TIMER5 clock [warm reset insensitive]	<a href="#">Section 8.1.12.3.6</a>
1Ch	CLKSEL_TIMER6_CLK	Selects the Mux select line for TIMER6 clock [warm reset insensitive]	<a href="#">Section 8.1.12.3.7</a>
20h	CM_CPTS_RFT_CLKSEL	Selects the Mux select line for CPTS RFT clock [warm reset insensitive]	<a href="#">Section 8.1.12.3.8</a>
28h	CLKSEL_TIMER1MS_CLK	Selects the Mux select line for TIMER1 clock [warm reset insensitive]	<a href="#">Section 8.1.12.3.9</a>
2Ch	CLKSEL_GFX_FCLK	Selects the divider value for GFX clock [warm reset insensitive]	<a href="#">Section 8.1.12.3.10</a>
30h	CLKSEL_PRU_ICSS_OCP_CLK	Controls the Mux select line for PRU-ICSS OCP clock [warm reset insensitive]	<a href="#">Section 8.1.12.3.11</a>
34h	CLKSEL_LCDC_PIXEL_CLK	Controls the Mux select line for LCDC PIXEL clock [warm reset insensitive]	<a href="#">Section 8.1.12.3.12</a>
38h	CLKSEL_WDT1_CLK	Selects the Mux select line for Watchdog1 clock [warm reset insensitive]	<a href="#">Section 8.1.12.3.13</a>
3Ch	CLKSEL_GPIO0_DBCLK	Selects the Mux select line for GPIO0 debounce clock [warm reset insensitive]	<a href="#">Section 8.1.12.3.14</a>

**8.1.12.3.1 CLKSEL\_TIMER7\_CLK Register (offset = 4h) [reset = 1h]**

 CLKSEL\_TIMER7\_CLK is shown in [Figure 8-138](#) and described in [Table 8-147](#).

Selects the Mux select line for TIMER7 clock [warm reset insensitive]

**Figure 8-138. CLKSEL\_TIMER7\_CLK Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**8.1.12.3.5 CM\_MAC\_CLKSEL Register (offset = 14h) [reset = 4h]**

CM\_MAC\_CLKSEL is shown in [Figure 8-142](#) and described in [Table 8-151](#).

Selects the clock divide ration for MII clock [warm reset insensitive]

**Figure 8-142. CM\_MAC\_CLKSEL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-151. CM\_MAC\_CLKSEL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2	MII_CLK_SEL	R/W	1h	MII Clock Divider Selection. This bit is warm reset insensitive when CPSW RESET_ISO is enabled 0x0 = SEL0 : Selects 1/2 divider of SYSCLK2 0x1 = SEL1 : Selects 1/5 divide ratio of SYSCLK2
1-0	Reserved	R	0h	

**8.1.12.3.6 CLKSEL\_TIMER5\_CLK Register (offset = 18h) [reset = 1h]**

 CLKSEL\_TIMER5\_CLK is shown in [Figure 8-143](#) and described in [Table 8-152](#).

Selects the Mux select line for TIMER5 clock [warm reset insensitive]

**Figure 8-143. CLKSEL\_TIMER5\_CLK Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-152. CLKSEL\_TIMER5\_CLK Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	Reserved	R	0h	
1-0	CLKSEL	R/W	1h	Selects the Mux select line for TIMER5 clock [warm reset insensitive] 0x0 = SEL1 : Select TCLKIN clock 0x1 = SEL2 : Select CLK_M_OSC clock 0x2 = SEL3 : Select CLK_32KHZ clock 0x3 = SEL4 : Reserved

**8.1.12.3.7 CLKSEL\_TIMER6\_CLK Register (offset = 1Ch) [reset = 1h]**

CLKSEL\_TIMER6\_CLK is shown in Figure 8-144 and described in Table 8-153.

Selects the Mux select line for TIMER6 clock [warm reset insensitive]

**Figure 8-144. CLKSEL\_TIMER6\_CLK Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-153. CLKSEL\_TIMER6\_CLK Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	Reserved	R	0h

Bit	Field	Type	Reset	Description
31-2	Reserved	R	0h	
1	CLKSEL_GFX_FCLK	R/W	0h	Selects the clock on gfx fclk [warm reset insensitive] 0x0 = SEL0 : SGX FCLK is from CORE PLL (same as L3 clock) 0x1 = SEL1 : SGX FCLK is from PER PLL (192 MHz clock)
0	CLKDIV_SEL_GFX_FCLK	R/W	0h	Selects the divider value on gfx fclk [warm reset insensitive] 0x0 = DIV1 : SGX FCLK is same as L3 Clock or 192MHz Clock 0x1 = DIV2 : SGX FCLK is L3 clock/2 or 192Mhz/2

**8.1.12.3.11 CLKSEL\_PRU\_ICSS\_OCP\_CLK Register (offset = 30h) [reset = 0h]**

CLKSEL\_PRU\_ICSS\_OCP\_CLK is shown in [Figure 8-148](#) and described in [Table 8-157](#).

Controls the Mux select line for PRU-ICSS OCP clock [warm reset insensitive]

**Figure 8-148. CLKSEL\_PRU\_ICSS\_OCP\_CLK Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-157. CLKSEL\_PRU\_ICSS\_OCP\_CLK Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	CLKSEL	R/W	0h	Controls Mux Select of PRU-ICSS OCP clock mux 0x0 = SEL1 : Select L3F clock as OCP Clock of PRU-ICSS 0x1 = SEL2 : Select DISP DPLL clock as OCP clock of PRU-ICSS

**8.1.12.3.12 CLKSEL\_LCDC\_PIXEL\_CLK Register (offset = 34h) [reset = 0h]**

CLKSEL\_LCDC\_PIXEL\_CLK is shown in [Figure 8-149](#) and described in [Table 8-158](#).

Controls the Mux select line for LCDC PIXEL clock [warm reset insensitive]

**Figure 8-149. CLKSEL\_LCDC\_PIXEL\_CLK Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-158. CLKSEL\_LCDC\_PIXEL\_CLK Register Field Descriptions**

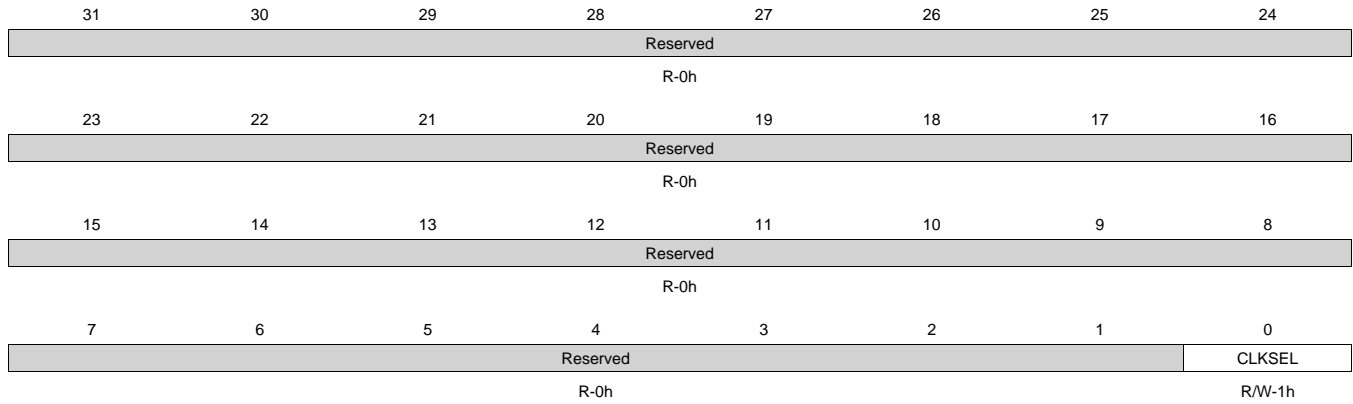

Bit	Field	Type	Reset	Description
31-2	Reserved	R	0h	
1-0	CLKSEL	R/W	0h	Controls the Mux Select of LCDC PIXEL clock 0x0 = SEL1 : Select DISP PLL CLKOUTM2 0x1 = SEL2 : Select CORE PLL CLKOUTM5 0x2 = SEL3 : Select PER PLL CLKOUTM2 0x3 = SEL4 : Reserved

**8.1.12.3.13 CLKSEL\_WDT1\_CLK Register (offset = 38h) [reset = 1h]**

CLKSEL\_WDT1\_CLK is shown in [Figure 8-150](#) and described in [Table 8-159](#).

Selects the Mux select line for Watchdog1 clock [warm reset insensitive]

**Figure 8-150. CLKSEL\_WDT1\_CLK Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-159. CLKSEL\_WDT1\_CLK Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	CLKSEL	R/W	1h	Selects the Mux select line for WDT1 clock [warm reset insensitive] 0x0 = SEL1 : Select 32KHZ clock from RC Oscillator 0x1 = SEL2 : Select 32KHZ from 32K Clock divider

### 8.1.12.3.14 CLKSEL\_GPIO0\_DBCLK Register (offset = 3Ch) [reset = 0h]

CLKSEL\_GPIO0\_DBCLK is shown in [Figure 8-151](#) and described in [Table 8-160](#).

Selects the Mux select line for GPIO0 debounce clock [warm reset insensitive]

**Figure 8-151. CLKSEL\_GPIO0\_DBCLK Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-160. CLKSEL\_GPIO0\_DBCLK Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	Reserved	R	0h	
1-0	CLKSEL	R/W	0h	Selects the Mux select line for GPIO0 debounce clock [warm reset insensitive] 0x0 = SEL1 : Select 32KHZ clock from RC Oscillator 0x1 = SEL2 : Select 32KHZ from 32K Crystal Oscillator 0x2 = SEL3 : Select 32KHZ from Clock Divider

### 8.1.12.4 CM\_MPU Registers

[Table 8-161](#) lists the memory-mapped registers for the CM\_MPU. All register offset addresses not listed in [Table 8-161](#) should be considered as reserved locations and the register contents should not be modified.

**Table 8-161. CM\_MPU REGISTERS**

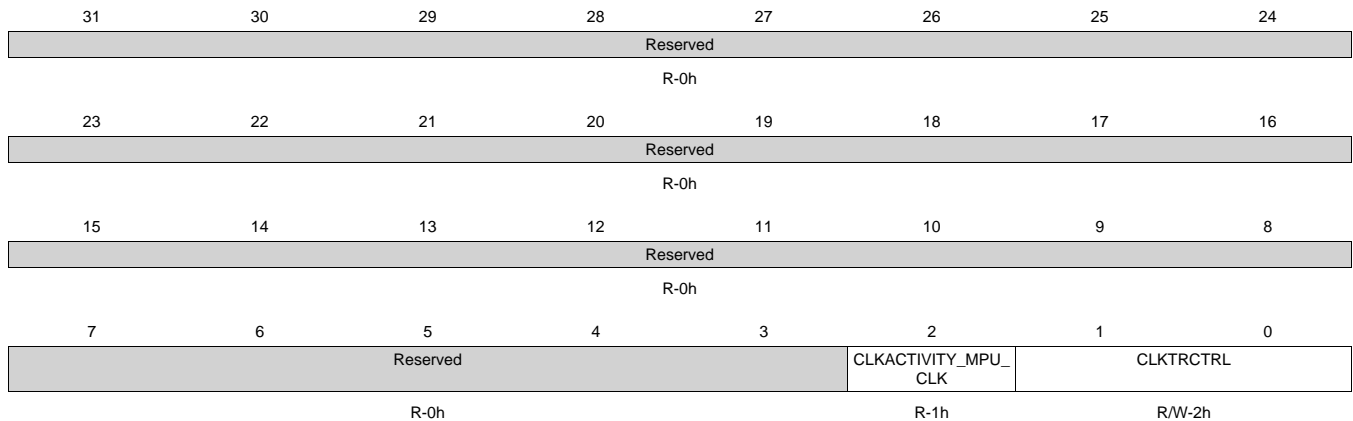

Offset	Acronym	Register Name	Section
0h	CM_MPU_CLKSTCTRL	This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.	<a href="#">Section 8.1.12.4.1</a>
4h	CM_MPU_MPU_CLKCTRL	This register manages the MPU clocks.	<a href="#">Section 8.1.12.4.2</a>

**8.1.12.4.1 CM\_MPU\_CLKSTCTRL Register (offset = 0h) [reset = 6h]**

CM\_MPU\_CLKSTCTRL is shown in [Figure 8-152](#) and described in [Table 8-162](#).

This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

**Figure 8-152. CM\_MPU\_CLKSTCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-162. CM\_MPU\_CLKSTCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2	CLKACTIVITY_MPU_CLK	R	1h	This field indicates the state of the MPU Clock 0x0 = Inact : Corresponding clock is gated 0x1 = Act : Corresponding clock is active
1-0	CLKTRCTRL	R/W	2h	Controls the clock state transition of the MPU clock domains. 0x0 = NO_SLEEP : NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. 0x1 = SW_SLEEP : SW_SLEEP: Start a software forced sleep transition on the domain. 0x2 = SW_WKUP : SW_WKUP: Start a software forced wake-up transition on the domain. 0x3 = Reserved : Reserved.

**8.1.12.4.2 CM\_MPU\_MPU\_CLKCTRL Register (offset = 4h) [reset = 2h]**

CM\_MPU\_MPU\_CLKCTRL is shown in [Figure 8-153](#) and described in [Table 8-163](#).

This register manages the MPU clocks.

**Figure 8-153. CM\_MPU\_MPU\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-163. CM\_MPU\_MPU\_CLKCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	Reserved	R	0h	
18	STBYST	R	0h	Module standby status. 0x0 = Func : Module is functional (not in standby) 0x1 = Standby : Module is in standby
17-16	IDLEST	R	0h	Module idle status. 0x0 = Func : Module is fully functional, including OCP 0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion 0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock 0x3 = Disable : Module is disabled and cannot be accessed
15-2	Reserved	R	0h	
1-0	MODULEMODE	R/W	2h	Control the way mandatory clocks are managed. 0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1 = RESERVED_1 : Reserved 0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3 = RESERVED : Reserved

**8.1.12.5 CM\_DEVICE Registers**

[Table 8-164](#) lists the memory-mapped registers for the CM\_DEVICE. All register offset addresses not listed in [Table 8-164](#) should be considered as reserved locations and the register contents should not be modified.

**Table 8-164. CM\_DEVICE REGISTERS**

Offset	Acronym	Register Name	Section
0h	CM_CLKOUT_CTRL	This register provides the control over CLKOUT2 output	<a href="#">Section 8.1.12.5.1</a>

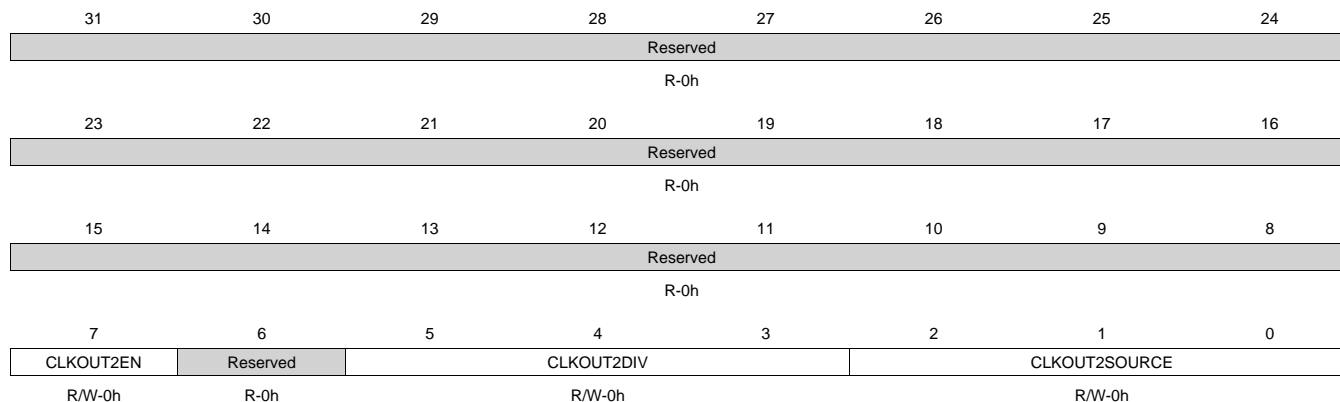

### 8.1.12.5.1 CM\_CLKOUT\_CTRL Register (offset = 0h) [reset = 0h]

CM\_CLKOUT\_CTRL is shown in Figure 8-154 and described in Table 8-165.

This register provides the control over CLKOUT2 output

**Figure 8-154. CM\_CLKOUT\_CTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-165. CM\_CLKOUT\_CTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	Reserved	R	0h	
7	CLKOUT2EN	R/W	0h	This bit controls the external clock activity 0x0 = DIS : SYS_CLKOUT2 is disabled 0x1 = EN : SYS_CLKOUT2 is enabled
6	Reserved	R	0h	
5-3	CLKOUT2DIV	R/W	0h	THIS field controls the external clock division factor 0x0 = DIV1 : SYS_CLKOUT2/1 0x1 = DIV2 : SYS_CLKOUT2/2 0x2 = DIV3 : SYS_CLKOUT2/3 0x3 = DIV4 : SYS_CLKOUT2/4 0x4 = DIV5 : SYS_CLKOUT2/5 0x5 = DIV6 : SYS_CLKOUT2/6 0x6 = DIV7 : SYS_CLKOUT2/7 0x7 = Reserved
2-0	CLKOUT2SOURCE	R/W	0h	This field selects the external output clock source 0x0 = SEL0 : Select 32KHz Oscillator O/P 0x1 = SEL1 : Select L3 Clock 0x2 = SEL2 : Select DDR PHY Clock 0x3 = SEL4 : Select 192Mhz clock from PER PLL 0x4 = SEL5 : Select LCD Pixel Clock

### 8.1.12.6 CM\_RTC Registers

Table 8-166 lists the memory-mapped registers for the CM\_RTC. All register offset addresses not listed in Table 8-166 should be considered as reserved locations and the register contents should not be modified.

**Table 8-166. CM\_RTC REGISTERS**

Offset	Acronym	Register Name	Section
0h	CM_RTC_RTC_CLKCTRL	This register manages the RTC clocks.	<a href="#">Section 8.1.12.6.1</a>
4h	CM_RTC_CLKSTCTRL	This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.	<a href="#">Section 8.1.12.6.2</a>

**8.1.12.6.1 CM\_RTC\_RTC\_CLKCTRL Register (offset = 0h) [reset = 30002h]**

CM\_RTC\_RTC\_CLKCTRL is shown in [Figure 8-155](#) and described in [Table 8-167](#).

This register manages the RTC clocks.

**Figure 8-155. CM\_RTC\_RTC\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-167. CM\_RTC\_RTC\_CLKCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	Reserved	R	0h	
18	Reserved	R	0h	
17-16	IDLEST	R	3h	Module idle status. 0x0 = Func : Module is fully functional, including OCP 0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion 0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock 0x3 = Disable : Module is disabled and cannot be accessed
15-2	Reserved	R	0h	
1-0	MODULEMODE	R/W	2h	Control the way mandatory clocks are managed. 0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1 = RESERVED_1 : Reserved 0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3 = RESERVED : Reserved

### 8.1.12.6.2 CM\_RTC\_CLKSTCTRL Register (offset = 4h) [reset = 102h]

CM\_RTC\_CLKSTCTRL is shown in [Figure 8-156](#) and described in [Table 8-168](#).

This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

**Figure 8-156. CM\_RTC\_CLKSTCTRL Register**

31-18	Reserved	R	0h	
17-16	IDLEST	R	3h	Module idle status. 0x0 = Func : Module is fully functional, including OCP 0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion 0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock 0x3 = Disable : Module is disabled and cannot be accessed
15-2	Reserved	R	0h	
1-0	MODULEMODE	R/W	0h	Control the way mandatory clocks are managed. 0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1 = RESERVED_1 : Reserved 0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3 = RESERVED : Reserved

### 8.1.12.8 CM\_CEFUSE Registers

[Table 8-175](#) lists the memory-mapped registers for the CM\_CEFUSE. All register offset addresses not listed in [Table 8-175](#) should be considered as reserved locations and the register contents should not be modified.

**Table 8-175. CM\_CEFUSE REGISTERS**

Offset	Acronym	Register Name	Section
0h	CM_CEFUSE_CLKSTCTRL	This register enables the domain power state transition. It controls the HW supervised domain power state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.	<a href="#">Section 8.1.12.8.1</a>

**Table 8-175. CM\_CEFUSE REGISTERS (continued)**

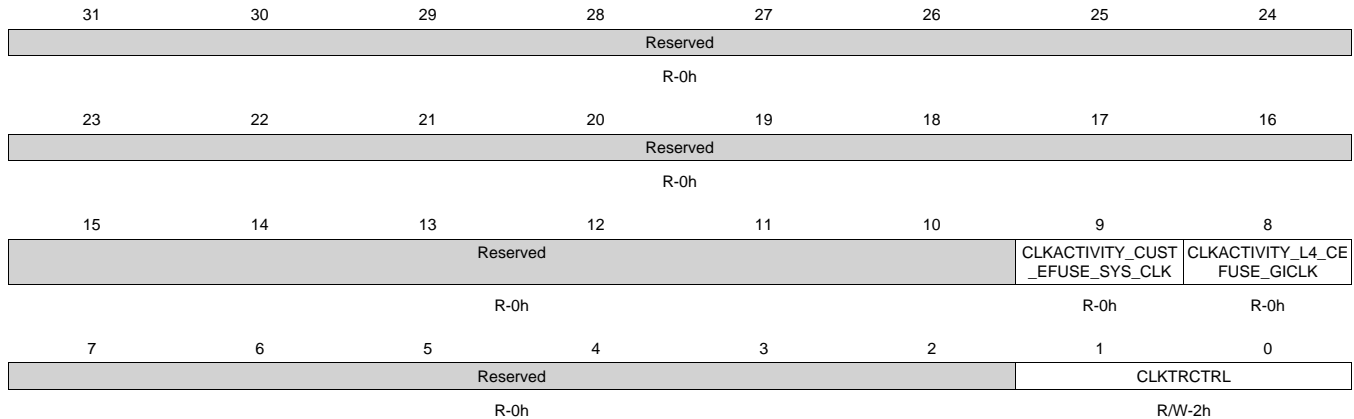

Offset	Acronym	Register Name	Section
20h	CM_CEFUSE_CEFUSE_CLKCTR L	This register manages the CEFUSE clocks.	<a href="#">Section 8.1.12.8.2</a>

### 8.1.12.8.1 CM\_CEFUSE\_CLKSTCTRL Register (offset = 0h) [reset = 2h]

CM\_CEFUSE\_CLKSTCTRL is shown in [Figure 8-162](#) and described in [Table 8-176](#).

This register enables the domain power state transition. It controls the HW supervised domain power state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

**Figure 8-162. CM\_CEFUSE\_CLKSTCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

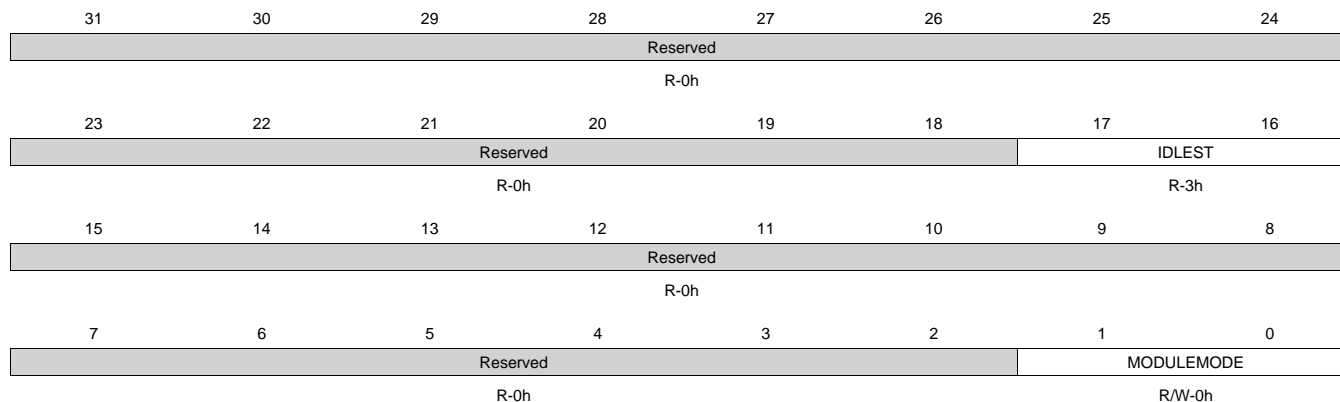

**Table 8-176. CM\_CEFUSE\_CLKSTCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-10	Reserved	R	0h	
9	CLKACTIVITY_CUST_EFUSE_SYS_CLK	R	0h	This field indicates the state of the Cust_Efuse_SYSCLK clock input of the domain. [warm reset insensitive] 0x0 = Inact : Corresponding clock is definitely gated 0x1 = Act : Corresponding clock is running or gating/ungating transition is on-going
8	CLKACTIVITY_L4_CEFUSE_GICLK	R	0h	This field indicates the state of the L4_CEFUSE_GCLK clock input of the domain. [warm reset insensitive] 0x0 = Inact : Corresponding clock is definitely gated 0x1 = Act : Corresponding clock is running or gating/ungating transition is on-going
7-2	Reserved	R	0h	
1-0	CLKTRCTRL	R/W	2h	Controls the clock state transition of the clock domain in customer efuse power domain. 0x0 = NO_SLEEP : NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. 0x1 = SW_SLEEP : SW_SLEEP: Start a software forced sleep transition on the domain. 0x2 = SW_WKUP : SW_WKUP: Start a software forced wake-up transition on the domain. 0x3 = Reserved : Reserved.

**8.1.12.8.2 CM\_CEFUSE\_CEFUSE\_CLKCTRL Register (offset = 20h) [reset = 30000h]**

 CM\_CEFUSE\_CEFUSE\_CLKCTRL is shown in [Figure 8-163](#) and described in [Table 8-177](#).

This register manages the CEFUSE clocks.

**Figure 8-163. CM\_CEFUSE\_CEFUSE\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-177. CM\_CEFUSE\_CEFUSE\_CLKCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-18	Reserved	R	0h	
17-16	IDLEST	R	3h	Module idle status. [warm reset insensitive] 0x0 = Func : Module is fully functional, including OCP 0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion 0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock 0x3 = Disable : Module is disabled and cannot be accessed
15-2	Reserved	R	0h	
1-0	MODULEMODE	R/W	0h	Control the way mandatory clocks are managed. 0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1 = RESERVED_1 : Reserved 0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3 = RESERVED : Reserved

## 8.1.13 Power Management Registers

### 8.1.13.1 PRM\_IRQ Registers

[Table 8-178](#) lists the memory-mapped registers for the PRM\_IRQ. All register offset addresses not listed in [Table 8-178](#) should be considered as reserved locations and the register contents should not be modified.

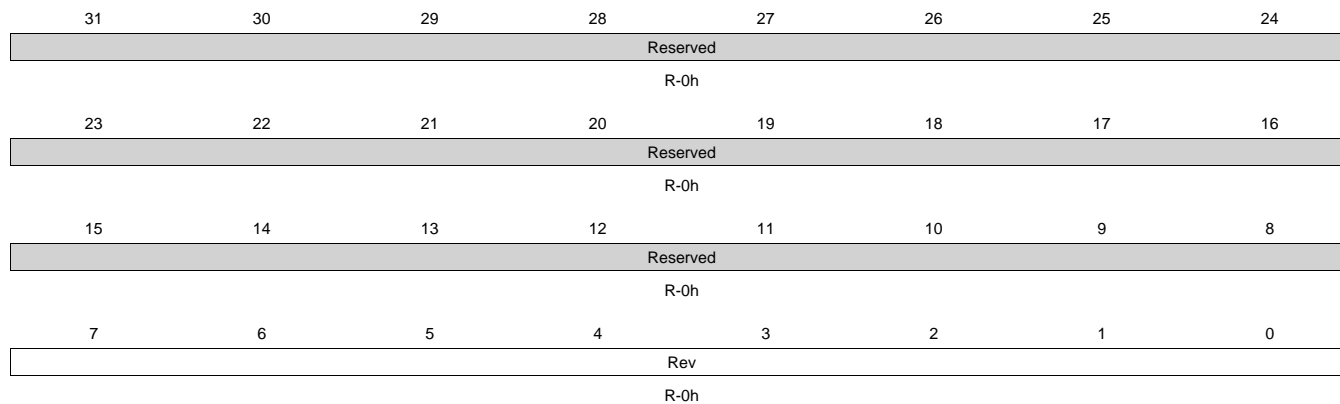

**Table 8-178. PRM\_IRQ REGISTERS**

Offset	Acronym	Register Name	Section
0h	REVISION_PRM	This register contains the IP revision code for the PRCM	<a href="#">Section 8.1.13.1.1</a>
4h	PRM_IRQSTATUS_MPU	This register provides status on MPU interrupt events. An event is logged whether interrupt generation for the event is enabled or not. SW is required to clear a set bit by writing a '1' into the bit-position to be cleared.	<a href="#">Section 8.1.13.1.2</a>
8h	PRM_IRQENABLE_MPU	This register is used to enable and disable events used to trigger MPU interrupt activation.	<a href="#">Section 8.1.13.1.3</a>
Ch	PRM_IRQSTATUS_M3	This register provides status on MPU interrupt events. An event is logged whether interrupt generation for the event is enabled or not. SW is required to clear a set bit by writing a '1' into the bit-position to be cleared.	<a href="#">Section 8.1.13.1.4</a>
10h	PRM_IRQENABLE_M3	This register is used to enable and disable events used to trigger MPU interrupt activation.	<a href="#">Section 8.1.13.1.5</a>

**8.1.13.1.1 REVISION\_PRM Register (offset = 0h) [reset = 0h]**

REVISION\_PRM is shown in [Figure 8-164](#) and described in [Table 8-179](#).

This register contains the IP revision code for the PRCM

**Figure 8-164. REVISION\_PRM Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-179. REVISION\_PRM Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	Reserved	R	0h	Reads returns 0.
7-0	Rev	R	0h	IP revision [ 7:4] Major revision [ 3:0] Minor revision Examples: 0x10 for 1.0, 0x21 for 2.1

**8.1.13.1.2 PRM\_IRQSTATUS\_MPU Register (offset = 4h) [reset = 0h]**

PRM\_IRQSTATUS\_MPU is shown in [Figure 8-165](#) and described in [Table 8-180](#).

This register provides status on MPU interrupt events. An event is logged whether interrupt generation for the event is enabled or not. SW is required to clear a set bit by writing a '1' into the bit-position to be cleared.

2	LogicStateSt	R	1h	Logic state status 0x0 = OFF : Logic in domain is OFF 0x1 = ON : Logic in domain is ON
1-0	Reserved	R	0h	

**8.1.13.3.4 RM\_WKUP\_RSTST Register (offset = Ch) [reset = 0h]**

RM\_WKUP\_RSTST is shown in Figure 8-175 and described in Table 8-192.

This register logs the different reset sources of the ALWON domain. Each bit is set upon release of the domain reset signal. Must be cleared by software. [warm reset insensitive]

**Figure 8-175. RM\_WKUP\_RSTST Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-192. RM\_WKUP\_RSTST Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	Reserved	R	0h	
7	ICECRUSHER_M3_RST	R/W	0h	M3 Processor has been reset due to M3 ICECRUSHER1 reset event 0x0 = RESET_NO : No reset 0x1 = RESET_YES : M3 Processor has been reset
6	EMULATION_M3_RST	R/W	0h	M3 Processor has been reset due to emulation reset source e.g. assert reset command initiated by the icepick module 0x0 = RESET_NO : No reset 0x1 = RESET_YES : M3 Processor has been reset
5	WKUP_M3_LRST	R/W	0h	M3 Processor has been reset 0x0 = RESET_NO : No reset 0x1 = RESET_YES : M3 Processor has been reset
4-0	Reserved	R	0h	

**8.1.13.4 PRM\_MPU Registers**

Table 8-193 lists the memory-mapped registers for the PRM\_MPU. All register offset addresses not listed in Table 8-193 should be considered as reserved locations and the register contents should not be modified.

**Table 8-193. PRM\_MPU REGISTERS**

Offset	Acronym	Register Name	Section
0h	PM_MPU_PWRSTCTRL	This register controls the MPU power state to reach upon mpu domain sleep transition	<a href="#">Section 8.1.13.4.1</a>
4h	PM_MPU_PWRSTST	This register provides a status on the current MPU power domain state0. [warm reset insensitive]	<a href="#">Section 8.1.13.4.2</a>
8h	RM_MPU_RSTST	This register logs the different reset sources of the ALWON domain. Each bit is set upon release of the domain reset signal. Must be cleared by software. [warm reset insensitive]	<a href="#">Section 8.1.13.4.3</a>

### 8.1.13.4.1 PM\_MPU\_PWRSTCTRL Register (offset = 0h) [reset = 1FF007h]

PM\_MPU\_PWRSTCTRL is shown in [Figure 8-176](#) and described in [Table 8-194](#).

This register controls the MPU power state to reach upon mpu domain sleep transition

**Figure 8-176. PM\_MPU\_PWRSTCTRL Register**

**Table 8-194. PM\_MPU\_PWRSTCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-26	Reserved	R	0h	
25	Reserved	R	0h	
24	mpu_ram_RETState	R/W	1h	Default power domain memory(ram) retention state when power domain is in retention
23	mpu_I2_RETState	R/W	1h	Default power domain memory(L2) retention state when power domain is in retention
22	mpu_I1_RETState	R/W	1h	Default power domain memory(L1) retention state when power domain is in retention
21-20	MPU_L2_ONState	R	3h	Default power domain memory state when domain is ON.
19-18	MPU_L1_ONState	R	3h	Default power domain memory state when domain is ON.
17-16	MPU_RAM_ONState	R/W	3h	Default power domain memory state when domain is ON. 0x0 = Mem_off 0x2 = Reserved 0x3 = Mem_on : Memory bank is on when the domain is ON.
15-5	Reserved	R	0h	
4	LowPowerStateChange	R/W	0h	Power state change request when domain has already performed a sleep transition. Allows going into deeper low power state without waking up the power domain. 0x0 = DIS : Do not request a low power state change. 0x1 = EN : Request a low power state change. This bit is automatically cleared when the power state is effectively changed or when power state is ON.
3	Reserved	R	0h	
2	LogicRETState	R/W	1h	Logic state when power domain is RETENTION 0x0 = logic_off : Only retention registers are retained and remaining logic is off when the domain is in RETENTION state. 0x1 = logic_ret : Whole logic is retained when domain is in RETENTION state.

**Table 8-194. PM\_MPU\_PWRSTCTRL Register Field Descriptions (continued)**

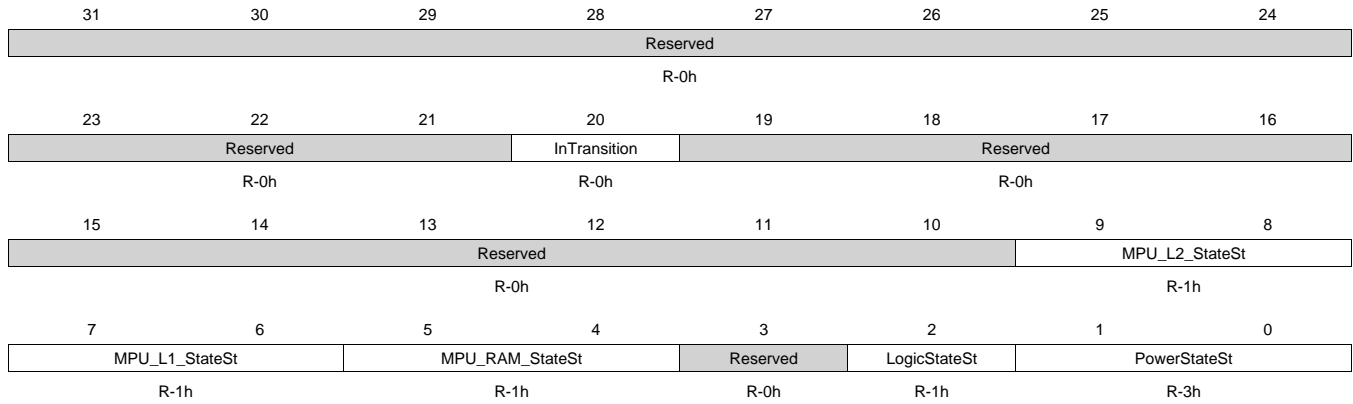

<b>Bit</b>	<b>Field</b>	<b>Type</b>	<b>Reset</b>	<b>Description</b>
1-0	PowerState	R/W	3h	Power state control 0x0 = OFF : OFF State 0x1 = RET 0x2 = Reserved 0x3 = ON : ON State

### 8.1.13.4.2 PM\_MPU\_PWRSTST Register (offset = 4h) [reset = 157h]

PM\_MPU\_PWRSTST is shown in [Figure 8-177](#) and described in [Table 8-195](#).

This register provides a status on the current MPU power domain state0. [warm reset insensitive]

**Figure 8-177. PM\_MPU\_PWRSTST Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-195. PM\_MPU\_PWRSTST Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-21	Reserved	R	0h	
20	InTransition	R	0h	Domain transition status 0x0 = No : No on-going transition on power domain 0x1 = Ongoing : Power domain transition is in progress.
19-10	Reserved	R	0h	
9-8	MPU_L2_StateSt	R	1h	MPU L2 memory state status 0x0 = Mem_off : Memory is OFF 0x2 = Reserved : Reserved 0x3 = Mem_on : Memory is ON
7-6	MPU_L1_StateSt	R	1h	MPU L1 memory state status 0x0 = Mem_off : Memory is OFF 0x2 = Reserved : Reserved 0x3 = Mem_on : Memory is ON
5-4	MPU_RAM_StateSt	R	1h	MPU_RAM memory state status 0x0 = Mem_off : Memory is OFF 0x2 = Reserved : Reserved 0x3 = Mem_on : Memory is ON
3	Reserved	R	0h	
2	LogicStateSt	R	1h	Logic state status 0x0 = OFF : Logic in domain is OFF 0x1 = ON : Logic in domain is ON
1-0	PowerStateSt	R	3h	Current Power State Status 0x0 = OFF : OFF State [warm reset insensitive] 0x1 = RET : RET State 0x3 = ON : ON State [warm reset insensitive]

### 8.1.13.4.3 RM\_MPU\_RSTST Register (offset = 8h) [reset = 0h]

RM\_MPU\_RSTST is shown in [Figure 8-178](#) and described in [Table 8-196](#).

This register logs the different reset sources of the ALWON domain. Each bit is set upon release of the domain reset signal. Must be cleared by software. [warm reset insensitive]

**Figure 8-178. RM\_MPU\_RSTST Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-196. RM\_MPU\_RSTST Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-15	Reserved	R	0h	
14-8	Reserved	R	0h	
7	Reserved	R	0h	
6	ICECRUSHER_MPU_RST	R/W	0h	MPU Processor has been reset due to MPU ICECRUSHER1 reset event 0x0 = RESET_NO : No icecrusher reset 0x1 = RESET_YES : MPU Processor has been reset upon icecrusher reset
5	EMULATION_MPU_RST	R/W	0h	MPU Processor has been reset due to emulation reset source e.g. assert reset command initiated by the icepick module 0x0 = RESET_NO : No emulation reset 0x1 = RESET_YES : MPU Processor has been reset upon emulation reset
4	Reserved	R	0h	
3	Reserved	R	0h	
2	Reserved	R	0h	
1-0	Reserved	R	0h	

### 8.1.13.5 PRM\_DEVICE Registers

[Table 8-197](#) lists the memory-mapped registers for the PRM\_DEVICE. All register offset addresses not listed in [Table 8-197](#) should be considered as reserved locations and the register contents should not be modified.

**Table 8-197. PRM\_DEVICE REGISTERS**

Offset	Acronym	Register Name	Section
0h	PRM_RSTCTRL		<a href="#">Section 8.1.13.5.1</a>
4h	PRM_RSTTIME		<a href="#">Section 8.1.13.5.2</a>
8h	PRM_RSTST		<a href="#">Section 8.1.13.5.3</a>

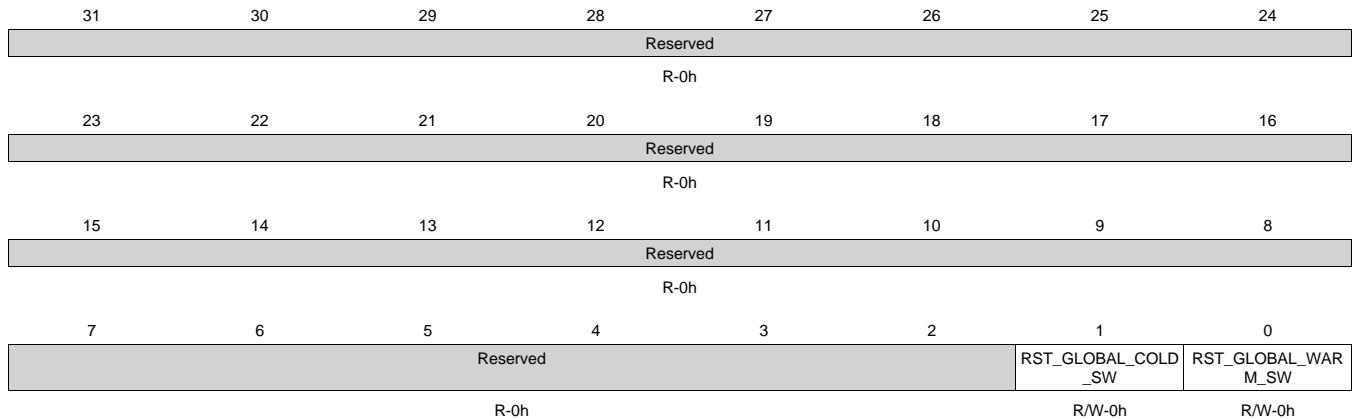

**Table 8-197. PRM\_DEVICE REGISTERS (continued)**

Offset	Acronym	Register Name	Section
Ch	PRM_SRAM_COUNT		<a href="#">Section 8.1.13.5.4</a>
10h	PRM_LDO_SRAM_CORE_SETUP		<a href="#">Section 8.1.13.5.5</a>
14h	PRM_LDO_SRAM_CORE_CTRL		<a href="#">Section 8.1.13.5.6</a>
18h	PRM_LDO_SRAM_MPU_SETUP		<a href="#">Section 8.1.13.5.7</a>
1Ch	PRM_LDO_SRAM_MPU_CTRL		<a href="#">Section 8.1.13.5.8</a>

**8.1.13.5.1 PRM\_RSTCTRL Register (offset = 0h) [reset = 0h]**

PRM\_RSTCTRL is shown in [Figure 8-179](#) and described in [Table 8-198](#).

Global software cold and warm reset control. This register is auto-cleared. Only write 1 is possible. A read returns 0 only.

**Figure 8-179. PRM\_RSTCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

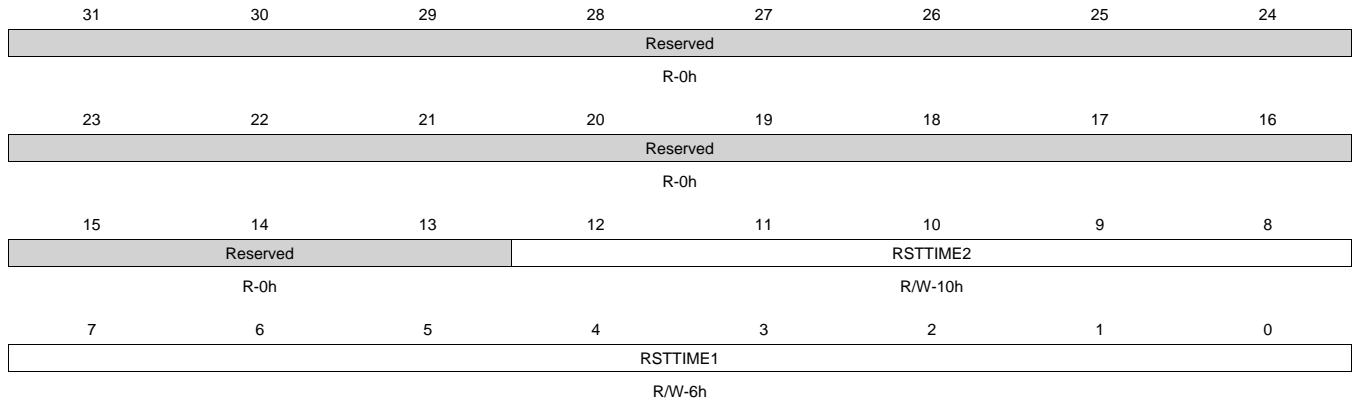

**Table 8-198. PRM\_RSTCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	Reserved	R	0h	
1	RST_GLOBAL_COLD_SW	R/W	0h	Global COLD software reset control. This bit is reset only upon a global cold source of reset. Read returns 0. 0x0 = 0x0 : Global COLD software reset is cleared. 0x1 = 0x1 : Asserts a global COLD software reset. The software must ensure the SDRAM is properly put in self-refresh mode before applying this reset.
0	RST_GLOBAL_WARM_SW	R/W	0h	Global WARM software reset control. This bit is reset upon any global source of reset (warm and cold). Read returns 0. 0x0 = 0x0 : Global warm software reset is cleared. 0x1 = 0x1 : Asserts a global warm software reset.

**8.1.13.5.2 PRM\_RSTTIME Register (offset = 4h) [reset = 1006h]**

 PRM\_RSTTIME is shown in [Figure 8-180](#) and described in [Table 8-199](#).

Reset duration control. [warm reset insensitive]

**Figure 8-180. PRM\_RSTTIME Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-199. PRM\_RSTTIME Register Field Descriptions**

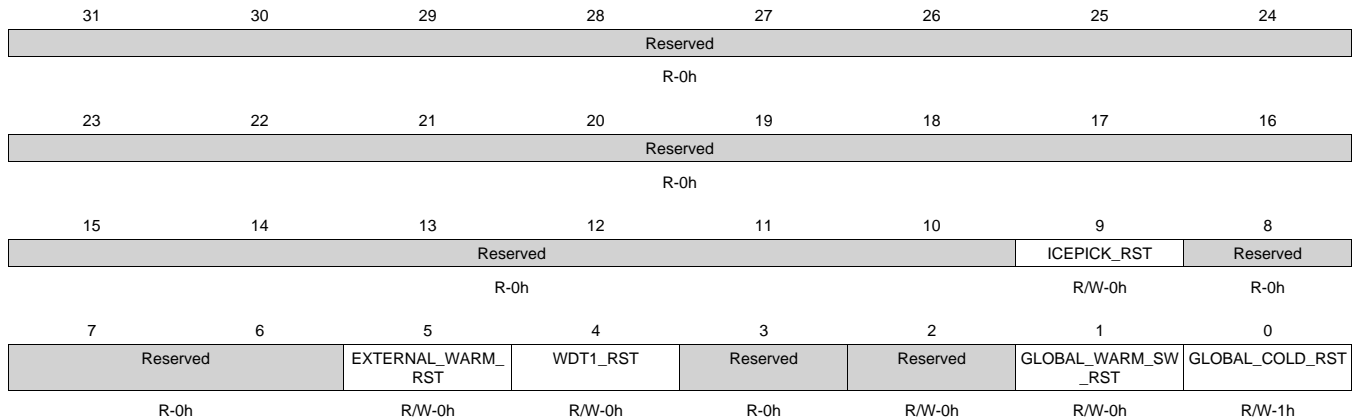

Bit	Field	Type	Reset	Description
31-13	Reserved	R	0h	
12-8	RSTTIME2	R/W	10h	(Power domain) reset duration 2 (number of CLK_M_OSC clock cycles)
7-0	RSTTIME1	R/W	6h	(Global) reset duration 1 (number of CLK_M_OSC clock cycles)

### 8.1.13.5.3 PRM\_RSTST Register (offset = 8h) [reset = 1h]

PRM\_RSTST is shown in Figure 8-181 and described in Table 8-200.

This register logs the global reset sources. Each bit is set upon release of the domain reset signal. Must be cleared by software. [warm reset insensitive]

**Figure 8-181. PRM\_RSTST Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-200. PRM\_RSTST Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-10	Reserved	R	0h	
9	ICEPICK_RST	R/W	0h	IcePick reset event. This is a source of global warm reset initiated by the emulation. [warm reset insensitive] 0x0 = 0x0 : No ICEPICK reset. 0x1 = 0x1 : IcePick reset has occurred.
8-6	Reserved	R	0h	
5	EXTERNAL_WARM_RST	R/W	0h	External warm reset event [warm reset insensitive] 0x0 = 0x0 : No global warm reset. 0x1 = 0x1 : Global external warm reset has occurred.
4	WDT1_RST	R/W	0h	Watchdog1 timer reset event. This is a source of global WARM reset. [warm reset insensitive] 0x0 = 0x0 : No watchdog reset. 0x1 = 0x1 : watchdog reset has occurred.
3	Reserved	R	0h	Reserved.
2	Reserved	R/W	0h	Reserved.
1	GLOBAL_WARM_SW_RST	R/W	0h	Global warm software reset event [warm reset insensitive] 0x0 = 0x0 : No global warm SW reset 0x1 = 0x1 : Global warm SW reset has occurred.
0	GLOBAL_COLD_RST	R/W	1h	Power-on (cold) reset event [warm reset insensitive] 0x0 = 0x0 : No power-on reset. 0x1 = 0x1 : Power-on reset has occurred.

**8.1.13.5.4 PRM\_SRAM\_COUNT Register (offset = Ch) [reset = 7800017h]**

PRM\_SRAM\_COUNT is shown in [Figure 8-182](#) and described in [Table 8-201](#).

Common setup for SRAM LDO transition counters. Applies to all voltage domains. [warm reset insensitive]

**Figure 8-182. PRM\_SRAM\_COUNT Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-201. PRM\_SRAM\_COUNT Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	StartUp_Count	R/W	78h	Determines the start-up duration of SRAM and ABB LDO. The duration is computed as 16 x NbCycles of system clock cycles. Target is 50us.
23-16	SLPCNT_VALUE	R/W	0h	Delay between retention/off assertion of last SRAM bank and SRAMALLRET signal to LDO is driven high. Counting on system clock. Target is 2us.
15-8	VSETUPCNT_VALUE	R/W	0h	SRAM LDO rampup time from retention to active mode. The duration is computed as 8 x NbCycles of system clock cycles. Target is 30us.
7-6	Reserved	R	0h	
5-0	PCHARGEcnt_VALUE	R/W	17h	Delay between de-assertion of standby_rta_ret_on and standby_rta_ret_good. Counting on system clock. Target is 600ns.

**8.1.13.5.5 PRM\_LDO\_SRAM\_CORE\_SETUP Register (offset = 10h) [reset = 0h]**

 PRM\_LDO\_SRAM\_CORE\_SETUP is shown in [Figure 8-183](#) and described in [Table 8-202](#).

Setup of the SRAM LDO for CORE voltage domain. [warm reset insensitive]

**Figure 8-183. PRM\_LDO\_SRAM\_CORE\_SETUP Register**

31-10	Reserved	R	0h	
9	SRAM_IN_TRANSITION	R	0h	Status indicating SRAM LDO state machine state. 0x0 = IDLE : SRAM LDO state machine is stable 0x1 = IN_TRANSITION : SRAM LDO state machine is in transition state
8	SRAMLDO_STATUS	R	0h	SRAMLDO status 0x0 = ACTIVE : SRAMLDO is in ACTIVE mode. 0x1 = RETENTION : SRAMLDO is on RETENTION mode.
7-1	Reserved	R	0h	
0	RETMODE_ENABLE	R/W	0h	Control if the SRAM LDO retention mode is used or not. 0x0 = Disabled : SRAM LDO is not allowed to go to RET mode 0x1 = Enabled : SRAM LDO go to RET mode when all memory of voltage domain are OFF or RET

**8.1.13.6 PRM\_RTC Registers**

[Table 8-206](#) lists the memory-mapped registers for the PRM\_RTC. All register offset addresses not listed in [Table 8-206](#) should be considered as reserved locations and the register contents should not be modified.

**Table 8-206. PRM\_RTC REGISTERS**

Offset	Acronym	Register Name	Section
0h	PM_RTC_PWRSTCTRL	This register controls the RTC power state to reach upon mpu domain sleep transition	<a href="#">Section 8.1.13.6.1</a>
4h	PM_RTC_PWRSTST	This register provides a status on the current RTC power domain state0. [warm reset insensitive]	<a href="#">Section 8.1.13.6.2</a>

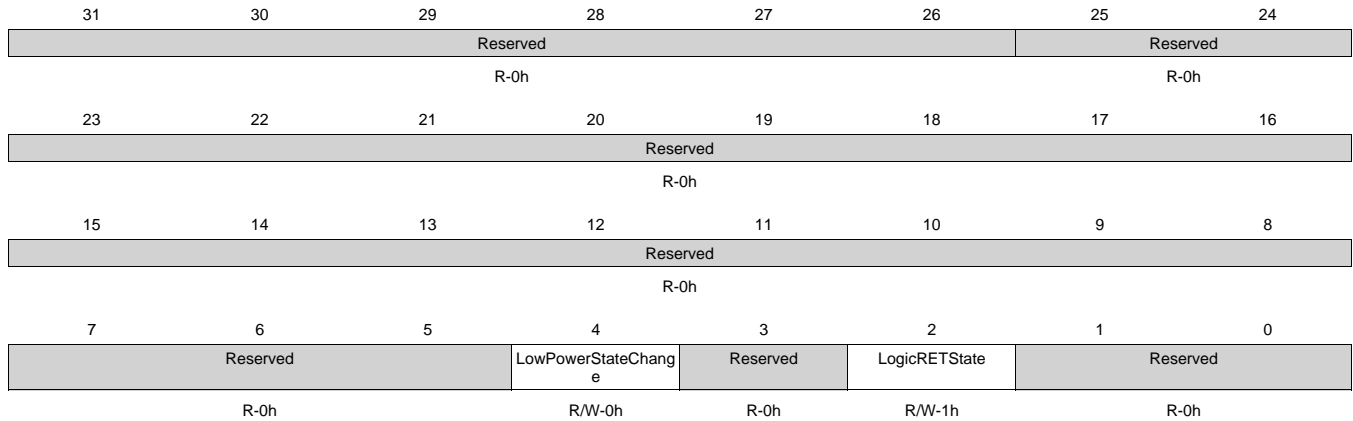

### 8.1.13.6.1 PM\_RTC\_PWRSTCTRL Register (offset = 0h) [reset = 4h]

PM\_RTC\_PWRSTCTRL is shown in [Figure 8-187](#) and described in [Table 8-207](#).

This register controls the RTC power state to reach upon mpu domain sleep transition

**Figure 8-187. PM\_RTC\_PWRSTCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-207. PM\_RTC\_PWRSTCTRL Register Field Descriptions**

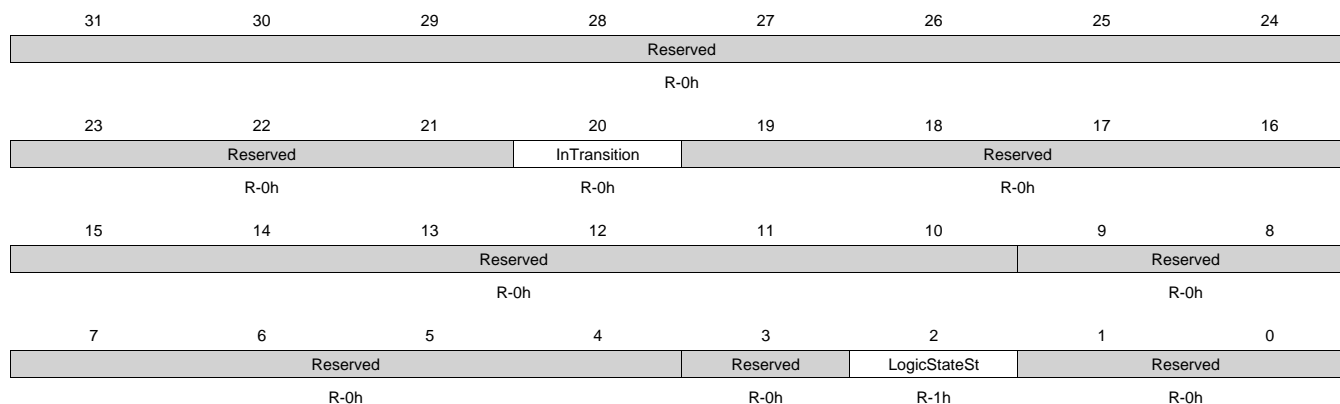

Bit	Field	Type	Reset	Description
31-26	Reserved	R	0h	
25-16	Reserved	R	0h	
15-5	Reserved	R	0h	
4	LowPowerStateChange	R/W	0h	Power state change request when domain has already performed a sleep transition. Allows going into deeper low power state without waking up the power domain. 0x0 = DIS : Do not request a low power state change. 0x1 = EN : Request a low power state change. This bit is automatically cleared when the power state is effectively changed or when power state is ON.
3	Reserved	R	0h	
2	LogicRETState	R/W	1h	Logic state when power domain is RETENTION 0x0 = logic_off : Only retention registers are retained and remaining logic is off when the domain is in RETENTION state. 0x1 = logic_ret : Whole logic is retained when domain is in RETENTION state.
1-0	Reserved	R	0h	

### 8.1.13.6.2 PM\_RTC\_PWRSTST Register (offset = 4h) [reset = 4h]

PM\_RTC\_PWRSTST is shown in [Figure 8-188](#) and described in [Table 8-208](#).

This register provides a status on the current RTC power domain state0. [warm reset insensitive]

**Figure 8-188. PM\_RTC\_PWRSTST Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-208. PM\_RTC\_PWRSTST Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-21	Reserved	R	0h	
20	InTransition	R	0h	Domain transition status 0x0 = No : No on-going transition on power domain 0x1 = Ongoing : Power domain transition is in progress.
19-10	Reserved	R	0h	
9-4	Reserved	R	0h	
3	Reserved	R	0h	
2	LogicStateSt	R	1h	Logic state status 0x0 = OFF : Logic in domain is OFF 0x1 = ON : Logic in domain is ON
1-0	Reserved	R	0h	

### 8.1.13.7 PRM\_GFX Registers

[Table 8-209](#) lists the memory-mapped registers for the PRM\_GFX. All register offset addresses not listed in [Table 8-209](#) should be considered as reserved locations and the register contents should not be modified.

**Table 8-209. PRM\_GFX REGISTERS**

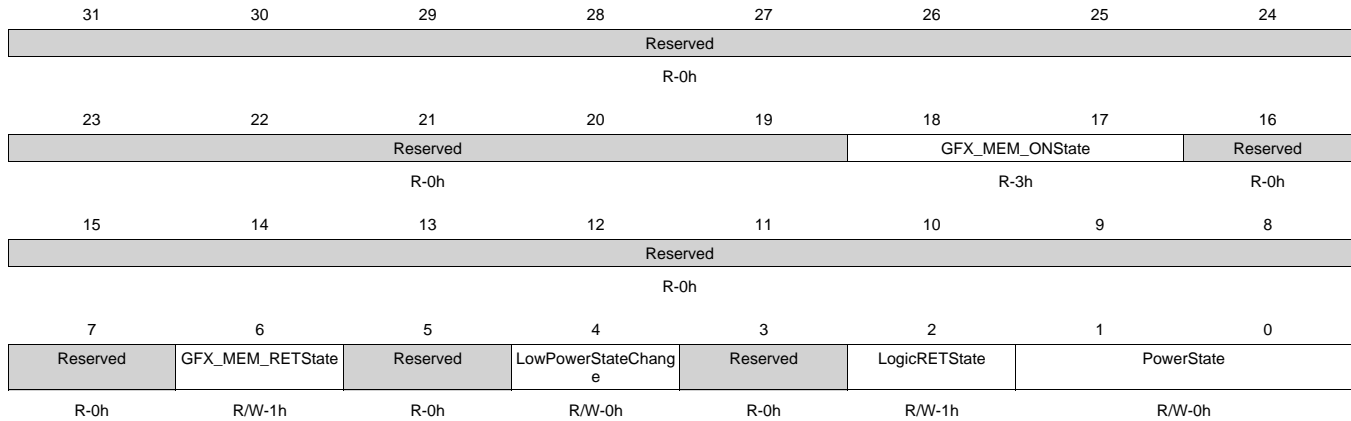

Offset	Acronym	Register Name	Section
0h	PM_GFX_PWRSTCTRL	This register controls the GFX power state to reach upon a domain sleep transition.	<a href="#">Section 8.1.13.7.1</a>
4h	RM_GFX_RSTCTRL	This register controls the release of the GFX Domain resets.	<a href="#">Section 8.1.13.7.2</a>
10h	PM_GFX_PWRSTST	This register provides a status on the current GFX power domain state. [warm reset insensitive]	<a href="#">Section 8.1.13.7.3</a>
14h	RM_GFX_RSTST	This register logs the different reset sources of the GFX domain. Each bit is set upon release of the domain reset signal. Must be cleared by software. [warm reset insensitive]	<a href="#">Section 8.1.13.7.4</a>

**8.1.13.7.1 PM\_GFX\_PWRSTCTRL Register (offset = 0h) [reset = 60044h]**

 PM\_GFX\_PWRSTCTRL is shown in [Figure 8-189](#) and described in [Table 8-210](#).

This register controls the GFX power state to reach upon a domain sleep transition.

**Figure 8-189. PM\_GFX\_PWRSTCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

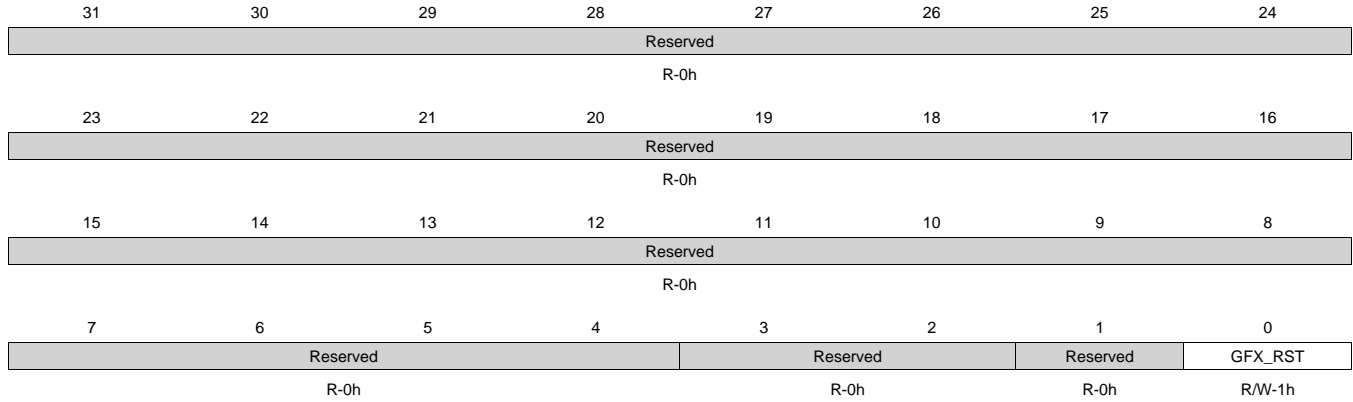

**Table 8-210. PM\_GFX\_PWRSTCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	Reserved	R	0h	
18-17	GFX_MEM_ONState	R	3h	GFX memory state when domain is ON.
16-7	Reserved	R	0h	
6	GFX_MEM_RETState	R/W	1h	
5	Reserved	R	0h	
4	LowPowerStateChange	R/W	0h	Power state change request when domain has already performed a sleep transition. Allows going into deeper low power state without waking up the power domain. 0x0 = DIS : Do not request a low power state change. 0x1 = EN : Request a low power state change. This bit is automatically cleared when the power state is effectively changed or when power state is ON.
3	Reserved	R	0h	
2	LogicRETState	R/W	1h	Logic state when power domain is RETENTION 0x0 = logic_off : Only retention registers are retained and remaining logic is off when the domain is in RETENTION state. 0x1 = logic_ret : Whole logic is retained when domain is in RETENTION state.
1-0	PowerState	R/W	0h	Power state control 0x0 = OFF : OFF State 0x1 = RET 0x2 = reserved_1 0x3 = ON : ON State

**8.1.13.7.2 RM\_GFX\_RSTCTRL Register (offset = 4h) [reset = 1h]**

RM\_GFX\_RSTCTRL is shown in [Figure 8-190](#) and described in [Table 8-211](#).

This register controls the release of the GFX Domain resets.

**Figure 8-190. RM\_GFX\_RSTCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-211. RM\_GFX\_RSTCTRL Register Field Descriptions**

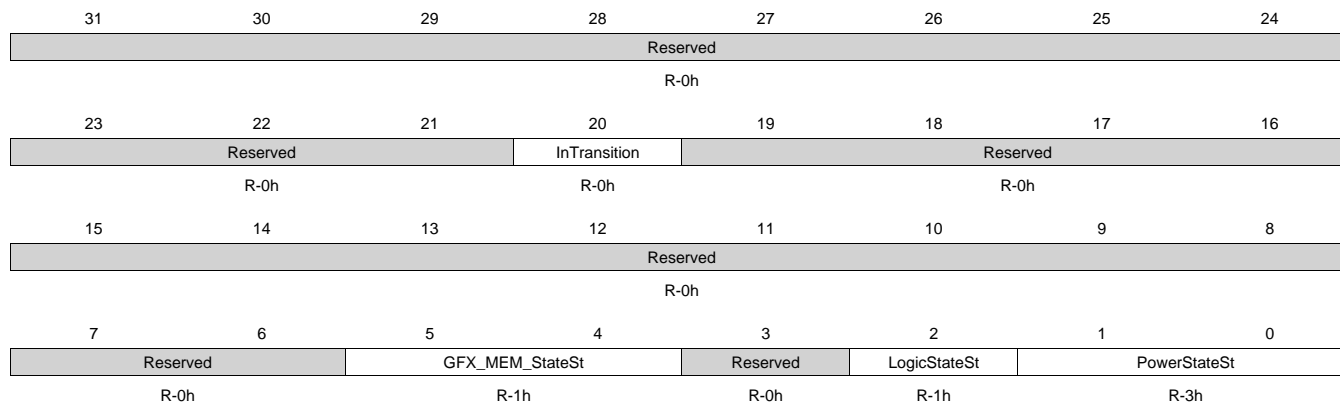

Bit	Field	Type	Reset	Description
31-4	Reserved	R	0h	
3-2	Reserved	R	0h	
1	Reserved	R	0h	
0	GFX_RST	R/W	1h	GFX domain local reset control 0x0 = CLEAR : Reset is cleared for the GFX Domain (SGX530) 0x1 = ASSERT : Reset is asserted for the GFX Domain (SGX 530)

### 8.1.13.7.3 PM\_GFX\_PWRSTST Register (offset = 10h) [reset = 17h]

PM\_GFX\_PWRSTST is shown in Figure 8-191 and described in Table 8-212.

This register provides a status on the current GFX power domain state. [warm reset insensitive]

**Figure 8-191. PM\_GFX\_PWRSTST Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-212. PM\_GFX\_PWRSTST Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-21	Reserved	R	0h	
20	InTransition	R	0h	Domain transition status 0x0 = No : No on-going transition on power domain 0x1 = Ongoing : Power domain transition is in progress.
19-6	Reserved	R	0h	
5-4	GFX_MEM_StateSt	R	1h	GFX memory state status 0x0 = Mem_off : Memory is OFF 0x2 = Reserved : Reserved 0x3 = Mem_on : Memory is ON
3	Reserved	R	0h	
2	LogicStateSt	R	1h	Logic state status 0x0 = OFF : Logic in domain is OFF 0x1 = ON : Logic in domain is ON
1-0	PowerStateSt	R	3h	Current Power State Status 0x0 = OFF : OFF State [warm reset insensitive] 0x1 = RET 0x3 = ON : ON State [warm reset insensitive]

**8.1.13.7.4 RM\_GFX\_RSTST Register (offset = 14h) [reset = 0h]**

RM\_GFX\_RSTST is shown in [Figure 8-192](#) and described in [Table 8-213](#).

This register logs the different reset sources of the GFX domain. Each bit is set upon release of the domain reset signal. Must be cleared by software. [warm reset insensitive]

**Figure 8-192. RM\_GFX\_RSTST Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Bit	Field	Type	Reset	Description
31-12	Reserved	R	0h	
11-2	Reserved	R	0h	
1	Reserved	R	0h	
0	GFX_RST	R/W	0h	GFX Domain Logic Reset 0x0 = RESET_NO : No SW reset occurred 0x1 = RESET_YES : GFX Domain Logic has been reset upon SW reset

**8.1.13.8 PRM\_CEFUSE Registers**

[Table 8-214](#) lists the memory-mapped registers for the PRM\_CEFUSE. All register offset addresses not listed in [Table 8-214](#) should be considered as reserved locations and the register contents should not be modified.

**Table 8-214. PRM\_CEFUSE REGISTERS**

Offset	Acronym	Register Name	Section
0h	PM_CEFUSE_PWRSTCTRL	This register controls the CEFUSE power state to reach upon a domain sleep transition	<a href="#">Section 8.1.13.8.1</a>
4h	PM_CEFUSE_PWRSTST	This register provides a status on the current CEFUSE power domain state. [warm reset insensitive]	<a href="#">Section 8.1.13.8.2</a>

**8.1.13.8.1 PM\_CEFUSE\_PWRSTCTRL Register (offset = 0h) [reset = 0h]**

PM\_CEFUSE\_PWRSTCTRL is shown in [Figure 8-193](#) and described in [Table 8-215](#).

This register controls the CEFUSE power state to reach upon a domain sleep transition

**Figure 8-193. PM\_CEFUSE\_PWRSTCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-215. PM\_CEFUSE\_PWRSTCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-5	Reserved	R	0h	
4	LowPowerStateChange	R/W	0h	Power state change request when domain has already performed a sleep transition. Allows going into deeper low power state without waking up the power domain. 0x0 = DIS : Do not request a low power state change. 0x1 = EN : Request a low power state change. This bit is automatically cleared when the power state is effectively changed or when power state is ON.
3-2	Reserved	R	0h	
1-0	PowerState	R/W	0h	Power state control 0x0 = OFF : OFF state 0x1 = Reserved : Reserved 0x2 = INACT : INACTIVE state 0x3 = ON : ON State

### 8.1.13.8.2 PM\_CEFUSE\_PWRSTST Register (offset = 4h) [reset = 7h]

PM\_CEFUSE\_PWRSTST is shown in [Figure 8-194](#) and described in [Table 8-216](#).

This register provides a status on the current CEFUSE power domain state. [warm reset insensitive]

**Figure 8-194. PM\_CEFUSE\_PWRSTST Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-216. PM\_CEFUSE\_PWRSTST Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-26	Reserved	R	0h	
25-24	LastPowerStateEntered	R/W	0h	Last low power state entered. Set to 0x3 upon write of the same only. This register is intended for debug purpose only. 0x0 = OFF : Power domain was previously OFF 0x1 = ON : Power domain was previously ON-ACTIVE
23-21	Reserved	R	0h	
20	InTransition	R	0h	Domain transition status 0x0 = No : No on-going transition on power domain 0x1 = Ongoing : Power domain transition is in progress.
19-3	Reserved	R	0h	
2	LogicStateSt	R	1h	Logic state status 0x0 = OFF : Logic in domain is OFF 0x1 = ON : Logic in domain is ON
1-0	PowerStateSt	R	3h	Current power state status 0x0 = OFF : Power domain is OFF 0x1 = RET : Power domain is in RETENTION 0x2 = INACTIVE : Power domain is ON-INACTIVE 0x3 = ON : Power domain is ON-ACTIVE

## Control Module

---

---

---

This chapter describes the control module of the device.

Topic	Page
<b>9.1 Introduction</b> .....	<b>747</b>
<b>9.2 Functional Description</b> .....	<b>747</b>
<b>9.3 CONTROL_MODULE Registers</b> .....	<b>757</b>

## 9.1 Introduction

The control module includes status and control logic not addressed within the peripherals or the rest of the device infrastructure. This module provides interface to control the following areas of the device:

- Functional I/O multiplexing
- Emulation controls
- Device control and status
- DDR PHY control and IO control registers
- EDMA event multiplexing control registers

**Note:** For writing to the control module registers, the Cortex A8 MPU will need to be in privileged mode of operation and writes will not work from user mode.

## 9.2 Functional Description

### 9.2.1 Control Module Initialization

The control module responds only to the internal POR and device type. At power on, reset values for the registers define the safe state for the device. In the initialization mode, only modules to be used at boot time are associated with the pads. Other module inputs are internally tied and output pads are turned off. After POR, software sets the pad functional multiplexing and configuration registers to the desired values according to the requested device configuration.

General-purpose (GP) devices include features that are inaccessible or unavailable. These inaccessible registers define the default or fixed device configuration or behavior.

The CONTROL\_STATUS[7:0] SYS\_BOOT bit field reflects the state of the sys\_boot pins captured at POR in the PRCM module.

### 9.2.2 Pad Control Registers

The Pad Control Registers are 32-bit registers to control the signal muxing and other aspects of each I/O pad. After POR, software must set the pad functional multiplexing and configuration registers to the desired values according to the requested device configuration. The configuration is controlled by pads or by a group of pads. Each configurable pin has its own configuration register for pullup/down control and for the assignment to a given module.

The following table shows the generic Pad Control Register Description.

**Table 9-1. Pad Control Register Field Descriptions**

Bit	Field	Value	Description
31-7	Reserved		Reserved. Read returns 0.
6	SLEWCTRL	0 1	Select between faster or slower slew rate. Fast Slow <sup>(1)</sup>
5	RXACTIVE	0 1	Input enable value for the Pad. Set to 0 for output only. Set to 1 for input or output. Receiver disabled Receiver enabled
4	PULLTYPESEL	0 1	Pad pullup/pulldown type selection Pulldown selected Pullup selected
3	PULLUDEN	0 1	Pad Pullup/pulldown enable Pullup/pulldown enabled. Pullup/pulldown disabled.
2-0	MUXMODE		Pad functional signal mux select

<sup>(1)</sup> Some peripherals do not support slow slew rate. To determine which interfaces support each slew rate, see *AM335x ARM Cortex-A8 Microprocessors (MPUs)* (literature number [SPRS717](#)).

### 9.2.2.1 Mode Selection

The MUXMODE field in the pad control registers defines the multiplexing mode applied to the pad. Modes are referred to by their decimal (from 0 to 7) or binary (from 0b000 to 0b111) representation. For most pads, the reset value for the MUXMODE field in the registers is 0b111. The exceptions are pads to be used at boot time to transfer data from selected peripherals to the external flash memory.

**Table 9-2. Mode Selection**

MUXMODE	Selected Mode
000b	Primary Mode = Mode 0
001b	Mode 1
010b	Mode 2
011b	Mode 3
100b	Mode 4
101b	Mode 5
110b	Mode 6
111b	Mode 7

Mode 0 is the primary mode. When mode 0 is set, the function mapped to the pin corresponds to the name of the pin. Mode 1 to mode 7 are possible modes for alternate functions. On each pin, some modes are used effectively for alternate functions, while other modes are unused and correspond to no functional configuration.

### 9.2.2.2 Pull Selection

There is no automatic gating control to ensure that internal weak pull-down/pull up resistors on a pad are disconnected whenever the pad is configured as output. If a pad is always configured in output mode, it is recommended for user software to disable any internal pull resistor tied to it, to avoid unnecessary consumption. The following table summarizes the various possible combinations of PULLTYPESEL and PULLUDEN fields of PAD control register.

**Table 9-3. Pull Selection**

PULL TYPE		Pin Behavior
PULLTYPESEL	PULLUDENABLE	
0b	0b	Pulldown selected and activated
0b	1b	Pulldown selected but not activated
1b	0b	Pullup selected and activated
1b	1b	Pullup selected but not activated

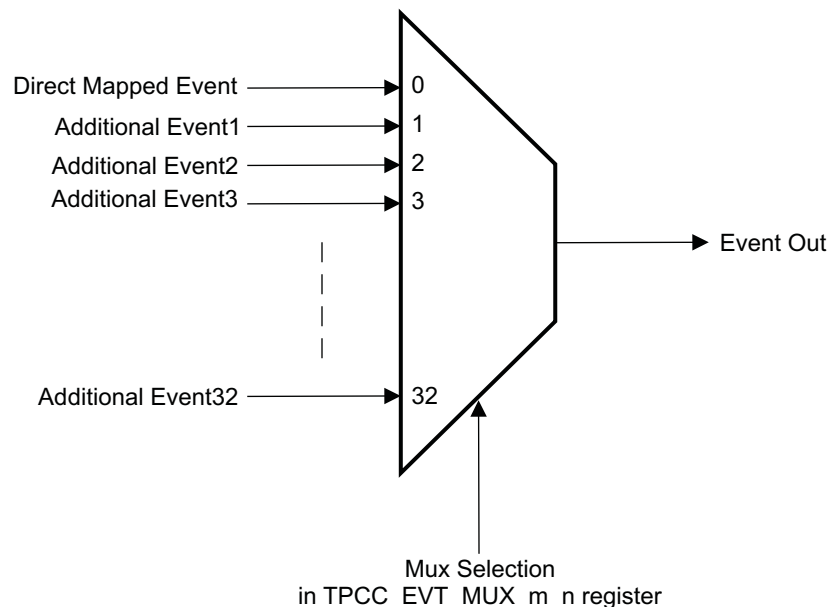

### 9.2.2.3 RX Active

The RXACTIVE bit is used to enable and disable the input buffer. This control can be used to help with power leakage or device isolation through the I/O. The characteristic of the signal is ultimately dictated by the mux mode the pad is put into.

### 9.2.3 EDMA Event Multiplexing

The device has more DMA events than can be accommodated by the TPCC's maximum number of events, which is 64. To overcome the device has one crossbar at the top level. This module will multiplex the extra events with all of the direct mapped events. Mux control registers are defined in the Control Module to select the event to be routed to the TPCC. Direct mapped event is the default (mux selection set to '0').

Figure 9-1. Event Crossbar

For every EDMA event there is a cross bar implemented in the design as shown in the figure. The direct mapped event/interrupt will be always connected to Mux input[0], The additional events will be connected to Mux input[1], Mux input[2], etc as defined in EDMA event table. The Mux selection value is programmed into the corresponding TPCC\_EVT\_MUX\_n register. The EVT\_MUX value can take a value from 1 to 32. Other values are reserved. By default the MUX\_selection value is written to 0, which means the direct mapped event is connected to the Event output.

When the additional event is selected through the Cross bar programming the direct mapped event cannot be used.

For example, when TINT0 (Timer Interrupt 0) event, which is not directly mapped to the DMA event source needs to be connected to EDMA channel no 24 (which is directly mapped to SDTXEVT0 event). The user has to program the EVT\_MUX\_24 field in TPCC\_EVT\_MUX\_24\_27 register to 22 (value corresponding to TINT0 interrupt in crossbar mapping). When this is set, TINT0 interrupt event will trigger the channel 24.

Please note that once this is set. The SDTXEVT0 can no longer be handled by EDMA. The user has to allocate the correct DMA event number for crossbar mapped events so that there is no compromise on the channel allocation for the used event numbers.

## 9.2.4 Device Control and Status

### 9.2.4.1 Control and Boot Status

The device configuration is set during power on or hardware reset (PORz sequence) by the configuration input pins (SYSBOOT[15:0]). The CONTROL\_STATUS register reflects the system boot and the device type configuration values as sampled when the power-on reset (PORz) signal is asserted. The Configuration input pins are sampled continuously during the PORz active period and the final sampled value prior to the last rising edge is latched in the register. The CONTROL\_STATUS register gives the status of the device boot process.

### 9.2.4.2 Interprocessor Communication

The control module has the IPC\_MSG\_REG (7:0) registers which is for sharing messages between Cortex M3 and the Cortex A8 MPU. The M3 TX end of event (M3\_TXEV\_EOI) register provides the mechanism to clear/enable the TX Event from Cortex M3 to Cortex A8 MPU Subsystem. See the M3\_TXEV\_EOI register description for further detail.

See [Section 8.1.4.6, Functional Sequencing for Power Management with Cortex M3](#), for specific information on how the IPC\_MSG\_REG registers are used to communicate with the Cortex-M3 firmware.

### 9.2.4.3 Initiator Priority Control

The control module provides the registers to control the bus interconnect priority and the EMIF priority.

#### 9.2.4.3.1 Initiator Priority Control for Interconnect

The INIT\_PRIORITY\_n register controls the infrastructure priority at the bus interconnects. This can be used for dynamic priority escalation. There are bit fields that control the interconnect priority for each bus initiator. By default all the initiators are given equal priority and the allocation is done on a round robin basis.

The priority can take a value from 0 to 3. The following table gives the valid set of priority values.

**Table 9-4. Interconnect Priority Values**

Interconnect Priority Value	Remarks
00	Low priority
01	Medium priority
10	Reserved
11	High priority

#### 9.2.4.3.2 Initiator Priority at EMIF

The MREQPRIO register provides an interface to change the access priorities for the various masters accessing the EMIF(DDR). Software can make use of this register to set the requestor priorities for required EMIF arbitration. The EMIF priority can take a value from 000b to 111b where 000b will be the highest priority and 111b will be lowest priority.

### 9.2.4.4 Peripheral Control and Status

#### 9.2.4.4.1 USB Control and Status

The USB\_CTRLn and USB\_STSn registers reflect the Control and Status of the USB instances. The USB IO lines can be used as UART TX and RX lines the USB Control register bit field GPIOMODE has settings that configures the USB lines as GPIO lines. The other USB PHY control settings for controlling the OTG settings and PHY are part of the USB\_CTRLn register.

The USB\_STSn register gives the status of the USB PHY module. See the USB\_STSn register description for further details.

See [Section 16.2.4, USB GPIO Details](#), for more information.

#### 9.2.4.4.2 USB Charger Detect

Each USB PHY contains circuitry which can automatically detect the presence of a charger attached to the USB port. The charger detection circuitry is compliant to the Battery Charging Specification Revision 1.1 from the USB Implementers Forum, which can be found at [www.usb.org](http://www.usb.org). See this document for more details on USB charger implementation.

##### 9.2.4.4.2.1 Features

The charger detection circuitry of each PHY has the following features:

- Contains a state machine which can automatically detect the presence of a Charging Downstream Port or a Dedicated Charging Port (see the Battery Charging Specification for the definition of these terms)
- Outputs a charger enable signal (3.3 V level active high CMOS driver) when a charger is present.
- Allows you to enable/disable the circuitry to save power

- The detection circuitry requires only a 3.3-V supply to be present to operate.
- The charger detection also has a manual mode which allows the user to implement the battery charging specification in software.

#### 9.2.4.4.2.2 Operation

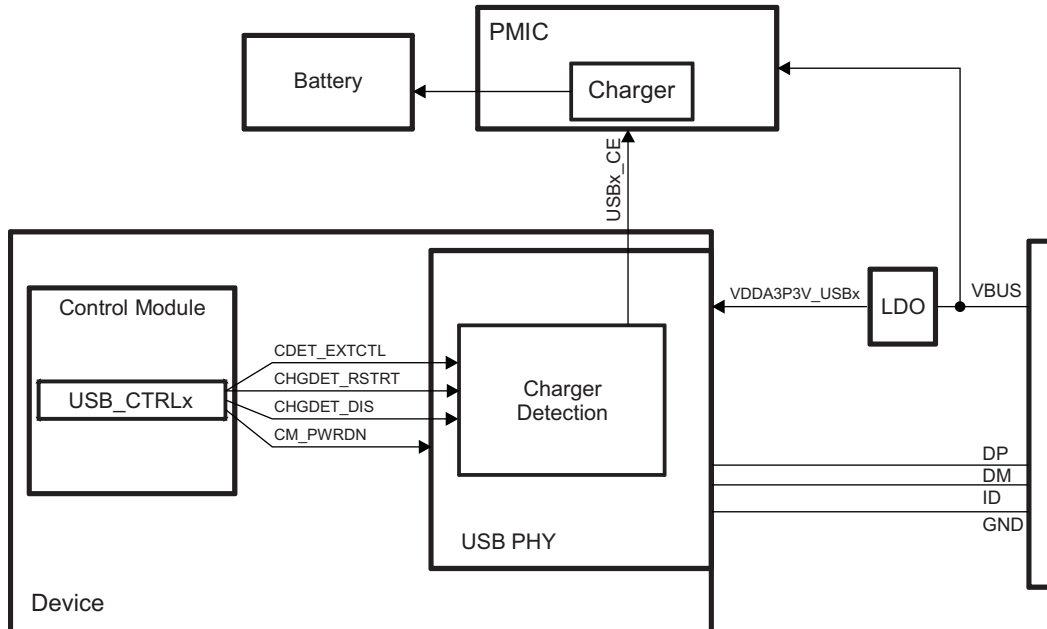

The control module gives the following interface to control the automatic charger detection circuitry:

- USB\_CTRLx.CDET\_EXTCTL: Turns the automatic detection on/off. Keep this bit 0 to keep the automatic detection on. Changing this to 1 enables the manual mode.
- USB\_CTRLx.CHGDET\_RSTRT: Restarts the charger detection state machine. To initiate the charger detection, change this bit from 1 to 0. If this bit is 1, the charger enable output (CE) is disabled.
- USB\_CTRLx.CHGDET\_DIS: Enables/disables the charger detection circuitry. Keep this bit 0 to keep this charger detection enabled. Setting this bit to 1 will power down the charger detection circuitry.
- USB\_CTRLx.CM\_PWRDN: Powers up/down the PHY which contains the charger detection circuitry. Clear this bit to 0 to enable power to the PHY.

To start the charger detection during normal operation, ensure that the PHY and charger are enabled and the automatic detection is turned on. Then, initiate a charger detection cycle by transitioning CHGDET\_RSTRT from 1 to 0. If a Charging Downstream Port or a Dedicated Charging Port is detected, the charger enable signal (USBx\_CE) will be driven high and remain high until the charger is disabled by either CHGDET\_DIS = 1 or CHGDET\_RSTRT=1. If the port remains unconnected after initiating the charger detect cycle, it will continue the detection until a charger is detected or an error condition occurs. Note that USBx\_CE is not an open drain output.

To disable the charger after successful detection, you must disable the charger detect circuitry with CHGDET\_DIS or CHGDET\_RSTRT, even if the charger is physically disconnected.

Figure 9-2. USB Charger Detection

Charger detection can be automatically started with no power to the rest of AM335x. If VDDA3P3V\_USBx is present, via an LDO powered by VBUS connected to a host, the charger detection state machine will automatically start and perform detection. If a charger is detected, USBx\_CE will be driven high, otherwise it will be driven low.

The charger detection circuitry performs the following steps of the Battery Charging specification v1.1:

1. VBUS Detect
2. Data Contact Detect

### 3. Primary Detection

Secondary Detection (to distinguish between a Charging Downstream Port and a Dedicated Charging Port) is a newly added feature of the v1.2 spec and is not implemented in the charger detection state machine.

#### 9.2.4.4.3 Ethernet MII Mode Selection

The control module provides a mechanism to select the Mode of operation of Ethernet MII interface. The GMII\_SEL register has register bit fields to select the MII/RMII/RGMII modes, clock sources, and delay mode.

#### 9.2.4.4.4 Ethernet Module Reset Isolation Control

This feature allows the device to undergo a warm reset without disrupting the switch or traffic being routed through the switch during the reset condition. The CPSW Reset Isolation register (RESET\_ISO) has an ISO\_CONTROL field which controls the reset isolation feature.

If the reset isolation is enabled, any warm reset source will be blocked to the EMAC switch. If the EMAC reset isolation is NOT active (default state), then the warm reset sources are allowed to propagate as normal including to the EMAC Switch module (both reset inputs to the IP). All cold or POR resets will always propagate to the EMAC switch module as normal.

When RESET\_ISO is enabled, the following registers will not be disturbed by a warm reset:

- GMII\_SEL
- CONF\_GPMC\_A[11:0]
- CONF\_GPMC\_WAIT0
- CONF\_GPMC\_WPN
- CONF\_GPMC\_BEN1
- CONF\_MII1\_COL
- CONF\_MII1\_CRS
- CONF\_MII1\_RX\_ER
- CONF\_MII1\_TX\_EN
- CONF\_MII1\_RX\_DV
- CONF\_MII1\_TXD[3:0]
- CONF\_MII1\_TX\_CLK
- CONF\_MII1\_RX\_CLK
- CONF\_MII1\_RXD[3:0]
- CONF\_RMII1\_REF\_CLK
- CONF\_MDIO\_DATA
- CONF\_MDIO\_CLK

### 9.2.4.4.5 Timer/eCAP Event Capture Control

The Timer 5, 6, 7 events and the eCAP0, 1, 2 events can be selected using the TIMER\_EVT\_CAPTURE and ECAP\_EVT\_CAPTURE registers. The following table lists the available sources for those events.

**Table 9-5. Available Sources for Timer[5–7] and eCAP[0–2] Events**

Event No.	Source module	Interrupt Name/Pin
0	For Timer 5 MUX input from IO signal TIMER5	TIMER5 IO pin
	For Timer 6 MUX input from IO signal TIMER6	TIMER6 IO pin
	For Timer 7 MUX input from IO signal TIMER7	TIMER7 IO pin
	For eCAP 0 MUX input from IO signal eCAP0	eCAP0 IO pin
	For eCAP 1 MUX input from IO signal eCAP1	eCAP1 IO pin
	For eCAP 2 MUX input from IO signal eCAP2	eCAP2 IO pin
1	UART0	UART0INT
2	UART1	UART1INT
3	UART2	UART2INT
4	UART3	UART3INT
5	UART4	UART4INT
6	UART5	UART5INT

**9.2.4.4.6 ADC Capture Control**

The following chip level events can be connected through the software-controlled multiplexer to the TSC\_ADC module.

1. PRU-ICSS Host Event 0
2. Timer 4 Event
3. Timer 5 Event
4. Timer 6 Event
5. Timer 7 Event

This pin is the external hardware trigger to start the ADC channel conversion. The ADC\_EVT\_CAPT register needs to be programmed to select the proper source for this conversion.

**Figure 9-3. Timer Events**

The following table contains the value to be programmed in the selection mux.

**Table 9-6. Selection Mux Values**

ADC_EVENT_SEL Value	ADC External event selected
000	PRU-ICSS Host Event 0
001	Timer 4 Event
010	Timer 5 Event
011	Timer 6 Event
100	Timer 7 Event
101-111	Reserved

## 9.2.5 DDR PHY

**Table 9-7. DDR Slew Rate Control Settings<sup>(1)(2)</sup>**

sr0	sr1	Turn-on Time Level	Interface	Turn-on Time for Drv8 Setting (ps) <sup>(3)</sup>	Max Noise on IO Supply for Drv8 Setting <sup>(4)</sup>
0	0	Fastest	1.5 V	117	0.43
			1.8 V	116	0.6
0	1	Fast	1.5 V	430	0.17
			1.8 V	443	0.24
1	0	Slow	1.5 V	530	0.15
			1.8 V	567	0.21
1	1	Slowest	1.5 V	790	0.13
			1.8 V	815	0.18

<sup>(1)</sup> These values are programmed in the following registers: ddr\_cmd0\_ioctrl, ddr\_cmd1\_ioctrl, ddr\_cmd2\_ioctrl, ddr\_data0\_ioctrl, ddr\_data1\_ioctrl.

<sup>(2)</sup> Values for DDR\_CMDx\_IOCTL.io\_config\_sr\_clk should be programmed to the same value.

<sup>(3)</sup> Value is obtained at nominal PTV.

<sup>(4)</sup> Value is the average across PTVs.

**Table 9-8. DDR Impedance Control Settings<sup>(1)(2)(3)</sup>**

I2	I1	I0	Drive Setting Name	Output Impedance ( $R_{on}$ )	Drive Strength $ I_{OH} ,  I_{OL} $	Example: $R_{on}$ for $R_{ext} = 49.9$ ohms	Example: $ I_{OH} ,  I_{OL} $ for $R_{ext} = 49.9$ ohms
0	0	0	Drv5	$1.6 * R_{ext}$	$0.625 * I_{out}$	80 ohms	5 mA
0	0	1	Drv6	$1.33 * R_{ext}$	$0.75 * I_{out}$	67 ohms	6 mA
0	1	0	Drv7	$1.14 * R_{ext}$	$0.875 * I_{out}$	57 ohms	7 mA
0	1	1	Drv8	$R_{ext}$	$I_{out}$	50 ohms	8 mA
1	0	0	Drv9	$0.88 * R_{ext}$	$1.125 * I_{out}$	44 ohms	9 mA
1	0	1	Drv10	$0.8 * R_{ext}$	$1.250 * I_{out}$	40 ohms	10 mA
1	1	0	Drv11	$0.73 * R_{ext}$	$1.375 * I_{out}$	36 ohms	11 mA
1	1	1	Drv12	$0.67 * R_{ext}$	$1.5 * I_{out}$	33 ohms	12 mA

<sup>(1)</sup> These values are programmed in the following registers: ddr\_cmd0\_ioctrl, ddr\_cmd1\_ioctrl, ddr\_cmd2\_ioctrl, ddr\_data0\_ioctrl, ddr\_data1\_ioctrl.

<sup>(2)</sup> Values for DDR\_CMDx\_IOCTL.io\_config\_i\_clk should be programmed to the same value.

<sup>(3)</sup>  $R_{ext}$  is the external VTP compensation resistor connected to DDR\_VTP terminal.

### 9.2.5.1 DDR PHY to IO Pin Mapping

The following table describes the DDR PHY to IO pin mapping.

**Table 9-9. DDR PHY to IO Pin Mapping**

Macro Pin	CMD0	CMD1	CMD2	DATA0	DATA1
0	ddr_ba2	Unconn	ddr_cke	ddr_d8	ddr_d0
1	ddr_wen	ddr_a15	ddr_resetn	ddr_d9	ddr_d1
2	ddr_ba0	ddr_a2	ddr_odt	ddr_d10	ddr_d2
3	ddr_a5	ddr_a12	Unconn	ddr_d11	ddr_d3
4	ddr_ck	ddr_a7	ddr_a14	ddr_d12	ddr_d4
5	ddr_ckn	ddr_ba1	ddr_a13	ddr_d13	ddr_d5
6	ddr_a3	ddr_a10	ddr_csn0	ddr_d14	ddr_d6
7	ddr_a4	ddr_a0	Unconn	ddr_d15	ddr_d7
8	ddr_a8	ddr_a11	ddr_a1	ddr_dqm1	ddr_dqm0

**Table 9-9. DDR PHY to IO Pin Mapping (continued)**

Macro Pin	CMD0	CMD1	CMD2	DATA0	DATA1
9	ddr_a9	ddr_casn	Unconn	ddr_dqs1	ddr_dqs0
10	ddr_a6	ddr_rasn	Unconn	ddr_dqsn1	ddr_dqsn0

### 9.3 CONTROL\_MODULE Registers

**Table 9-10** lists the memory-mapped registers for the CONTROL\_MODULE. All other register offset addresses not listed in **Table 9-10** should be considered as reserved locations and the register contents should not be modified.

**Table 9-10. CONTROL\_MODULE REGISTERS**

### 9.3.1 control\_revision Register (offset = 0h) [reset = 0h]

control\_revision is shown in Figure 9-4 and described in Table 9-11.

**Figure 9-4. control\_revision Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-11. control\_revision Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-30	ip_rev_scheme	R	0h	01 - New Scheme
29-28	Reserved	R	0h	
27-16	ip_rev_func	R	0h	Function indicates a software compatible module family. If there is no level of software compatibility a new Func number (and hence REVISION) should be assigned.
15-11	ip_rev_rtl	R	0h	RTL Version (R).
10-8	ip_rev_major	R	0h	Major Revision (X).
7-6	ip_rev_custom	R	0h	Indicates a special version for a particular device. Consequence of use may avoid use of standard Chip Support Library (CSL) / Drivers - 00: Non custom (standard) revision
5-0	ip_rev_minor	R	0h	Minor Revision (Y).

### 9.3.2 control\_hwinfo Register (offset = 4h) [reset = 0h]

control\_hwinfo is shown in [Figure 9-5](#) and described in [Table 9-12](#).

**Figure 9-5. control\_hwinfo Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

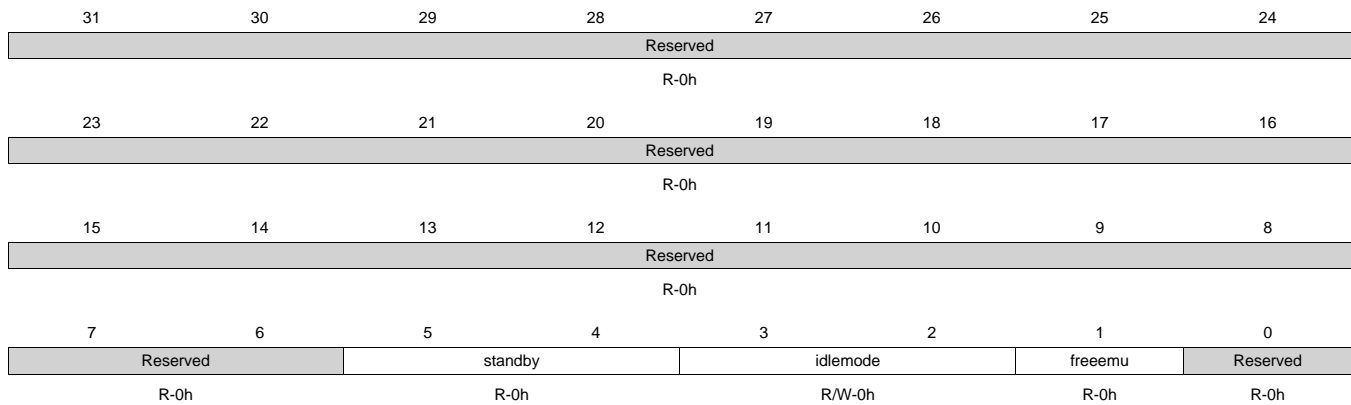

**Table 9-12. control\_hwinfo Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	ip_hwinfo	R	0h	IP Module dependent

### 9.3.3 control\_sysconfig Register (offset = 10h) [reset = 0h]

control\_sysconfig is shown in Figure 9-6 and described in Table 9-13.

**Figure 9-6. control\_sysconfig Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-13. control\_sysconfig Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-6	Reserved	R	0h	
5-4	standby	R	0h	Configure local initiator state management 00: Force Standby 01: No Standby Mode 10: Smart Standby 11: Smart Standby wakeup capable Reserved in Control Module since it has no local initiator.
3-2	idlemode	R/W	0h	Configure local target state management 00: Force Idle 01: No Idle 10: Smart Idle 11: Smart Idle wakeup capable
1	freemu	R	0h	Sensitivity to Emulation suspend input. 0: Module is sensitive to EMU suspend 1: Module not sensitive to EMU suspend
0	Reserved	R	0h	

### 9.3.4 control\_status Register (offset = 40h) [reset = 0h]

control\_status is shown in Figure 9-7 and described in Table 9-14.

**Figure 9-7. control\_status Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-14. control\_status Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	Reserved	R	0h	
23-22	sysboot1	R/W	0h	Used to select crystal clock frequency. See SYSBOOT Configuration Pins. Reset value is from SYSBOOT[15:14].
21-20	testmd	R/W	0h	Set to 00b. See SYSBOOT Configuration Pins for more information. Reset value is from SYSBOOT[13:12].
19-18	admux	R/W	0h	GPMC CS0 Default Address Muxing 00: No Addr/Data Muxing 01: Addr/Addr/Data Muxing 10: Addr/Data Muxing 11: Reserved Reset value is from SYSBOOT[11:10].
17	waiten	R/W	0h	GPMC CS0 Default Wait Enable 0: Ignore WAIT input 1: Use WAIT input See SYSBOOT Configuration Pins for more information. Reset value is from SYSBOOT[9].
16	bw	R/W	0h	GPMC CS0 Default Bus Width 0: 8-bit data bus 1: 16-bit data bus See SYSBOOT Configuration Pins for more information. Reset value is from SYSBOOT[8].
15-11	Reserved	R	0h	
10-8	devtype	R	0h	000: Reserved 001: Reserved 010: Reserved 011: General Purpose (GP) Device 111: Reserved
7-0	sysboot0	R/W	0h	Selected boot mode. See SYSBOOT Configuration Pins for more information. Reset value is from SYSBOOT[7:0].

### 9.3.5 control\_emif\_sdram\_config Register (offset = 110h) [reset = 0h]

The CONTROL\_EMIF\_SDRAM\_CONFIG register exports SDRAM configuration information to the EMIF after resuming from low power scenarios.

This register should be loaded with the same value as SDRAM\_CONFIG during DDR initialization.

control\_emif\_sdram\_config is shown in [Figure 9-8](#) and described in [Table 9-15](#).

**Figure 9-8. control\_emif\_sdram\_config Register**

31	30	29	28	27	26	25	24
SDRAM_TYPE			IBANK_POS			DDR_TERM	
R/W-0h			R/W-0h			R/W-0h	
23	22	21	20	19	18	17	16
Reserved	DYN_ODT		Reserved	SDRAM_DRIVE		CWL	
R-0h	R/W-0h		R-0h	R/W-0h		R/W-0h	
15	14	13	12	11	10	9	8
NARROW_MODE		CL			ROWSIZE		
R/W-0h		R/W-0h			R/W-0h		
7	6	5	4	3	2	1	0
ROWSIZE	IBANK			EBANK	PAGESIZE		
R/W-0h	R/W-0h			R/W-0h	R/W-0h		

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-15. control\_emif\_sdram\_config Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-29	SDRAM_TYPE	R/W	0h	SDRAM Type selection 000 – Reserved 001 – LPDDR1 010 – DDR2 011 – DDR3 100 – Reserved 101 – Reserved 110 – Reserved 111 – Reserved
28-27	IBANK_POS	R/W	0h	Internal bank position. 00 - All Bank Address bits assigned from OCP address above column address bits. 01 – Bank Address bits [1:0] assigned from OCP address above column address bits and bit [2] from OCP address bits above row address bits. 10 – Bank Address bit [0] assigned from OCP address above column address bits and bit [2:1] from OCP address bits above row address bits. 11 – All Bank Address bits assigned from OCP address bits above row address bits.
26-24	DDR_TERM	R/W	0h	DDR2 and DDR3 termination resistor value. Set to 0 to disable termination. For DDR2, set to 1 for 75 ohm, set to 2 for 150 ohm, and set to 3 for 50 ohm. For DDR3, set to 1 for RZQ/4, set to 2 for RZQ/2, set to 3 for RZQ/6, set to 4 for RZQ/12, and set to 5 for RZQ/8. All other values are reserved.
23	DDR2_DDQS	R/W	0h	DDR2 differential DQS enable. Set to 0 for single ended DQS. Set to 1 for differential DQS

**Table 9-15. control\_emif\_sdram\_config Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
22-21	DYN_ODT	R/W	0h	DDR3 Dynamic ODT. Set to 0 to turn off dynamic ODT. Set to 1 for RZQ/4 and set to 2 for RZQ/2. All other values are reserved.
20	Reserved	R	0h	Reserved. Read returns 0.
19-18	SDRAM_DRIVE	R/W	0h	SDRAM drive strength. For DDR2, set to 0 for normal, and set to 1 for weak drive strength. For DDR3, set to 0 for RZQ/6 and set to 1 for RZQ/7. For LPDDR1, set to 0 for full, set to 1 for 1/2, set to 2 for 1/4, and set to 3 for 1/8 drive strength. All other values are reserved.
17-16	CWL	R/W	0h	DDR3 CAS Write latency. Value of 0, 1, 2, and 3 (CAS write latency of 5, 6, 7, and 8) are supported. Use the lowest value supported for best performance. All other values are reserved.
15-14	NARROW_MODE	R/W	0h	SDRAM data bus width. Set to 0 for 32-bit and set to 1 for 16-bit. All other values are reserved.
13-10	CL	R/W	0h	CAS Latency. The value of this field defines the CAS latency to be used when accessing connected SDRAM devices. Value of 2, 3, 4, and 5 (CAS latency of 2, 3, 4, and 5) are supported for DDR2. Value of 2, 4, 6, 8, 10, 12, and 14 (CAS latency of 5, 6, 7, 8, 9, 10, and 11) are supported for DDR3. All other values are reserved.
9-7	ROWSIZE	R/W	0h	Row Size. Defines the number of row address bits of connected SDRAM devices. Set to 0 for 9 row bits, set to 1 for 10 row bits, set to 2 for 11 row bits, set to 3 for 12 row bits, set to 4 for 13 row bits, set to 5 for 14 row bits, set to 6 for 15 row bits, and set to 7 for 16 row bits. This field is only used when ibank_pos field in SDRAM Config register is set to 1, 2, or 3.
6-4	IBANK	R/W	0h	Internal Bank setup. Defines number of banks inside connected SDRAM devices. Set to 0 for 1 bank, set to 1 for 2 banks, set to 2 for 4 banks, and set to 3 for 8 banks. All other values are reserved.
3	EBANK	R/W	0h	External chip select setup. Defines whether SDRAM accesses will use 1 or 2 chip select lines. Set to 0 to use pad_cs_o_n[0] only. Set to 1 to use pad_cs_o_n[1:0].
2-0	PAGESIZE	R/W	0h	Page Size. Defines the internal page size of connected SDRAM devices. Set to 0 for 256-word page (8 column bits), set to 1 for 512-word page (9 column bits), set to 2 for 1024-word page (10 column bits), and set to 3 for 2048-word page (11 column bits). All other values are reserved.

### 9.3.6 core\_sldo\_ctrl Register (offset = 428h) [reset = 0h]

core\_sldo\_ctrl is shown in Figure 9-9 and described in Table 9-16.

**Figure 9-9. core\_sldo\_ctrl Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-16. core\_sldo\_ctrl Register Field Descriptions**

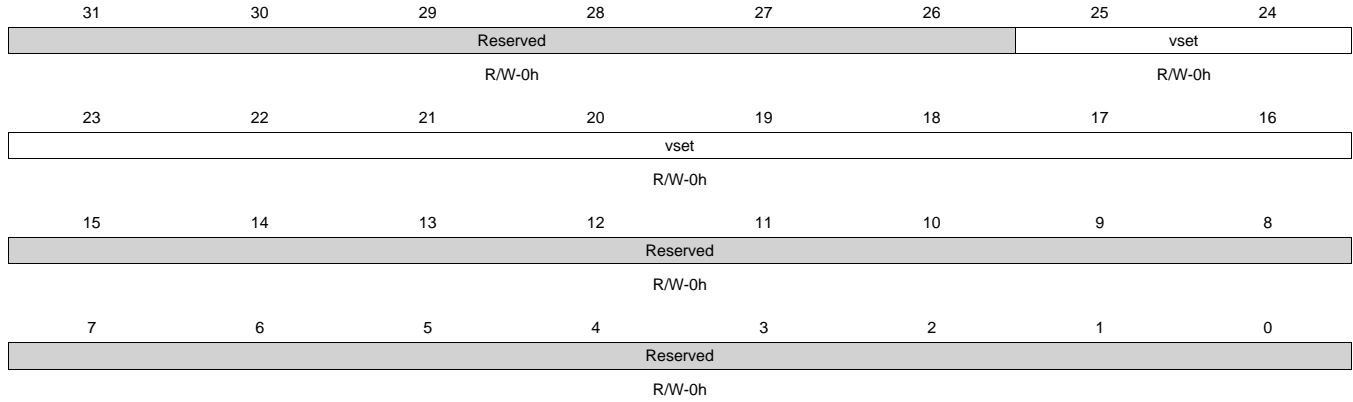

Bit	Field	Type	Reset	Description
31-26	Reserved	R/W	0h	
25-16	vset	R/W	0h	Trims VDDAR
15-0	Reserved	R/W	0h	

### 9.3.7 mpu\_sldo\_ctrl Register (offset = 42Ch) [reset = 0h]

mpu\_sldo\_ctrl is shown in [Figure 9-10](#) and described in [Table 9-17](#).

**Figure 9-10. mpu\_sldo\_ctrl Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

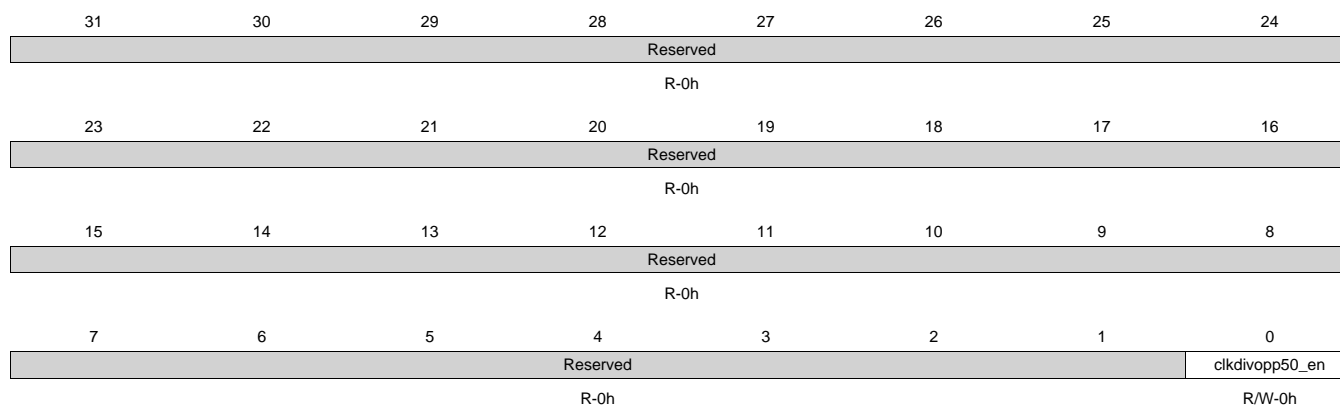

**Table 9-17. mpu\_sldo\_ctrl Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-26	Reserved	R/W	0h	
25-16	vset	R/W	0h	Trims VDDAR
15-0	Reserved	R/W	0h	

### 9.3.8 clk32kdivratio\_ctrl Register (offset = 444h) [reset = 0h]

clk32kdivratio\_ctrl is shown in Figure 9-11 and described in Table 9-18.

**Figure 9-11. clk32kdivratio\_ctrl Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-18. clk32kdivratio\_ctrl Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	clkdivopp50_en	R/W	0h	0 : OPP100 operation, use ratio for 24MHz to 32KHz division 1 : OPP50 operation, use ratio for 12MHz to 32KHz division

### 9.3.9 bandgap\_ctrl Register (offset = 448h) [reset = 0h]

bandgap\_ctrl is shown in Figure 9-12 and described in Table 9-19.

**Figure 9-12. bandgap\_ctrl Register**

31	30	29	28	27	26	25	24

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

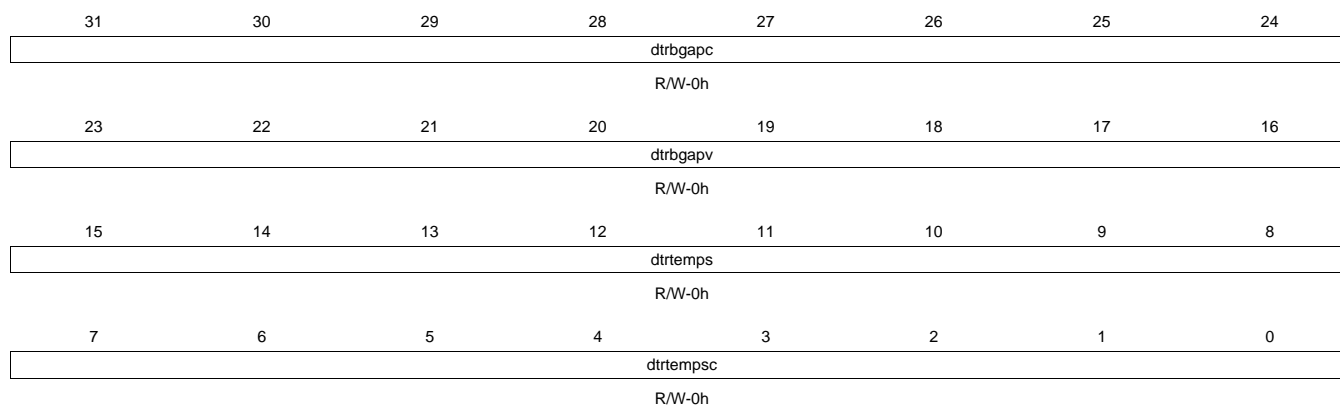

**Table 9-19. bandgap\_ctrl Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	Reserved	R	0h	
15-8	dtemp	R	0h	Temperature data from ADC. To be used when end of conversion (EOCZ) is 0.
7	cbiassel	R/W	0h	0: Select bandgap voltage as reference 1: Select resistor divider as reference
6	bgroff	R/W	0h	0: Normal operation 1: Bandgap is OFF (OFF Mode)
5	tmpsoff	R/W	0h	0: Normal operation 1: Temperature sensor is off and thermal shutdown in OFF mode
4	soc	R/W	0h	ADC start of conversion. Transition to high starts a new ADC conversion cycle.
3	clrz	R/W	0h	0: Resets the digital outputs
2	contconv	R/W	0h	0: ADC single conversion mode 1: ADC continuous conversion mode
1	ecoz	R	0h	ADC end of conversion 0: End of conversion 1: Conversion in progress
0	tshut	R	0h	0: Normal operation 1: Thermal shutdown event (greater than 147C)

### 9.3.10 bandgap\_trim Register (offset = 44Ch) [reset = 0h]

bandgap\_trim is shown in Figure 9-13 and described in Table 9-20.

**Figure 9-13. bandgap\_trim Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

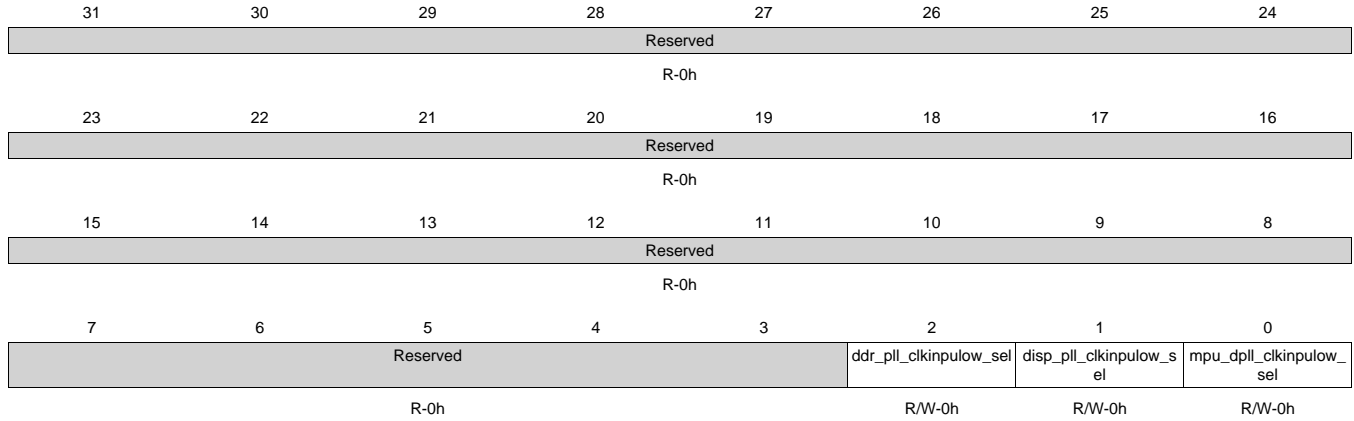

**Table 9-20. bandgap\_trim Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	dtrbgapc	R/W	0h	trim the output voltage of bandgap
23-16	dtrbgapv	R/W	0h	trim the output voltage of bandgap
15-8	dtrtemps	R/W	0h	trim the temperature sensor
7-0	dtrtempsc	R/W	0h	trim the temperature sensor

### 9.3.11 pll\_clkinpulow\_ctrl Register (offset = 458h) [reset = 0h]

pll\_clkinpulow\_ctrl is shown in [Figure 9-14](#) and described in [Table 9-21](#).

**Figure 9-14. pll\_clkinpulow\_ctrl Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

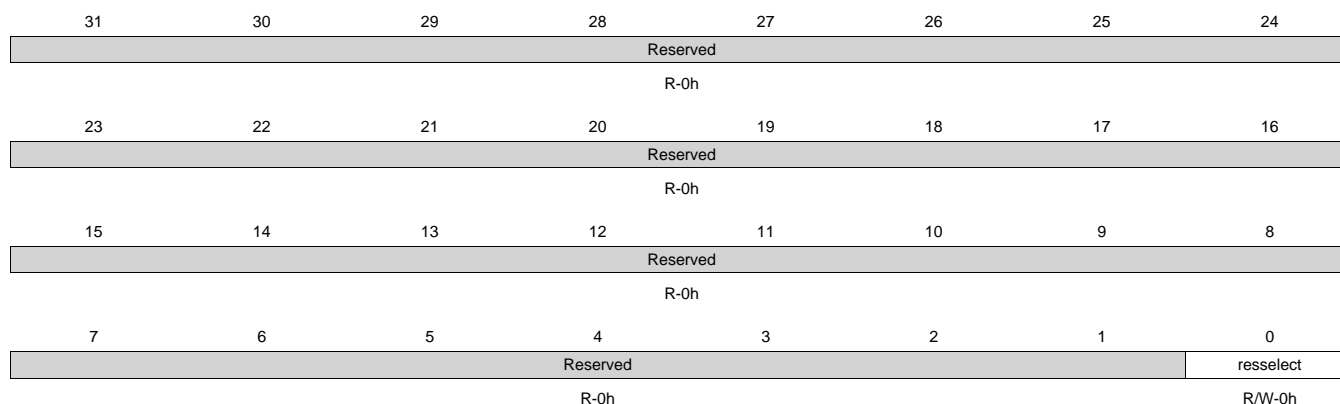

**Table 9-21. pll\_clkinpulow\_ctrl Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2	ddr_pll_clkinpulow_sel	R/W	0h	0 : Select CORE_CLKOUT_M6 clock as CLKINPULOW 1 : Select PER_CLKOUT_M2 clock as CLKINPULOW
1	disp_pll_clkinpulow_sel	R/W	0h	0 : Select CORE_CLKOUT_M6 clock as CLKINPULOW 1 : Select PER_CLKOUT_M2 clock as CLKINPULOW
0	mpu_dppll_clkinpulow_sel	R/W	0h	0 : Select CORE_CLKOUT_M6 clock as CLKINPULOW 1 : Select PER_CLKOUT_M2 clock as CLKINPULOW

### 9.3.12 mosc\_ctrl Register (offset = 468h) [reset = 0h]

mosc\_ctrl is shown in Figure 9-15 and described in Table 9-22.

**Figure 9-15. mosc\_ctrl Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

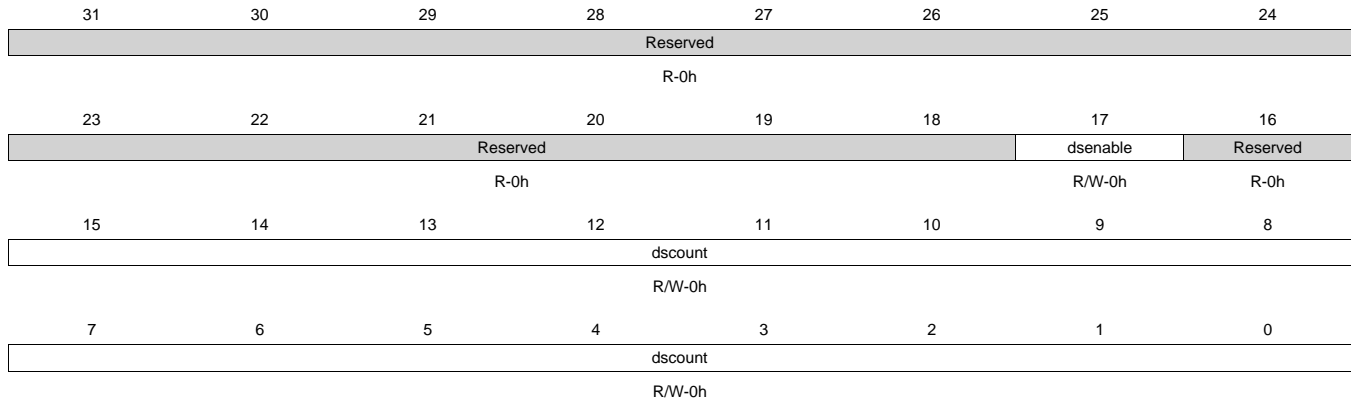

**Table 9-22. mosc\_ctrl Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	resselect	R/W	0h	For oscillation with a crystal while RESSELECT is 1, an external resistor must be connected between padxi and padxo to provide bias. 0: 1-MHz ohm resistor is connected between padxi and padxo for oscillator bias 1: Internal resistor is disconnected

### 9.3.13 deepsleep\_ctrl Register (offset = 470h) [reset = 0h]

deepsleep\_ctrl is shown in Figure 9-16 and described in Table 9-23.

**Figure 9-16. deepsleep\_ctrl Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-23. deepsleep\_ctrl Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-18	Reserved	R	0h	
17	dsenable	R/W	0h	Deep sleep enable 0: Normal operation 1: Master oscillator output is gated
16	Reserved	R	0h	
15-0	dscount	R/W	0h	Programmable count of how many CLK_M_OSC clocks needs to be seen before exiting deep sleep mode

### 9.3.14 dp11\_pwr\_sw\_status (offset = 50Ch) [reset = 0h]

dp11\_pwr\_sw\_status is shown in Figure 9-17 and described in Table 9-24.

**Figure 9-17. dp11\_pwr\_sw\_status Register**

31	30	29	28	27	26	25	24

Bit	Field	Type	Reset	Description
31-28	Reserved	R	0h	
27-26	tcwr2	R/W	0h	TPTC 2 Write Port initiator priority
25-24	tcrd2	R/W	0h	TPTC 2 Read Port initiator priority
23-22	tcwr1	R/W	0h	TPTC 1 Write Port initiator priority
21-20	tcrd1	R/W	0h	TPTC 1 Read Port initiator priority
19-18	tcwr0	R/W	0h	TPTC 0 Write Port initiator priority
17-16	tcrd0	R/W	0h	TPTC 0 Read Port initiator priority
15-14	p1500	R/W	0h	P1500 Port Initiator priority
13-8	Reserved	R	0h	
7-6	mmu	R/W	0h	System MMU initiator priority
5-4	pru_icss	R/W	0h	PRU-ICSS initiator priority
3-2	Reserved	R	0h	
1-0	host_arm	R/W	0h	Host Cortex A8 initiator priority

### 9.3.18 init\_priority\_1 Register (offset = 60Ch) [reset = 0h]

init\_priority\_1 is shown in Figure 9-21 and described in Table 9-28.

**Figure 9-21. init\_priority\_1 Register**

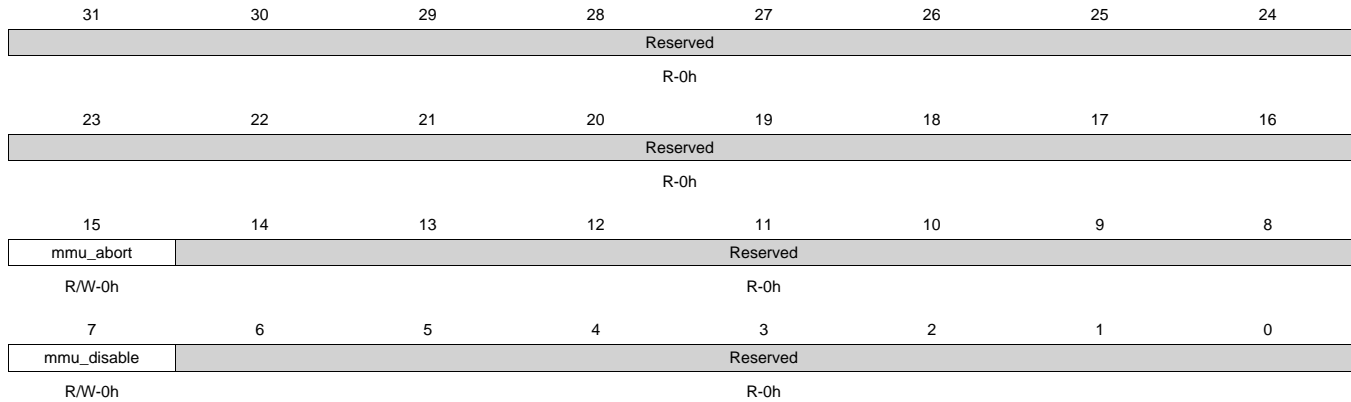

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-28. init\_priority\_1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-26	Reserved	R	0h	
25-24	debug	R/W	0h	Debug Subsystem initiator priority
23-22	lcd	R/W	0h	LCD initiator priority
21-20	sgx	R/W	0h	SGX initiator priority
19-18	Reserved	R	0h	
17-16	Reserved	R	0h	
15-8	Reserved	R	0h	
7-6	usb_qmgr	R/W	0h	USB Queue Manager initiator priority
5-4	usb_dma	R/W	0h	USB DMA port initiator priority
3-2	Reserved	R	0h	
1-0	cpsw	R/W	0h	CPSW initiator priority

### 9.3.19 mmu\_cfg Register (offset = 610h) [reset = 0h]

mmu\_cfg is shown in [Figure 9-22](#) and described in [Table 9-29](#).

**Figure 9-22. mmu\_cfg Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

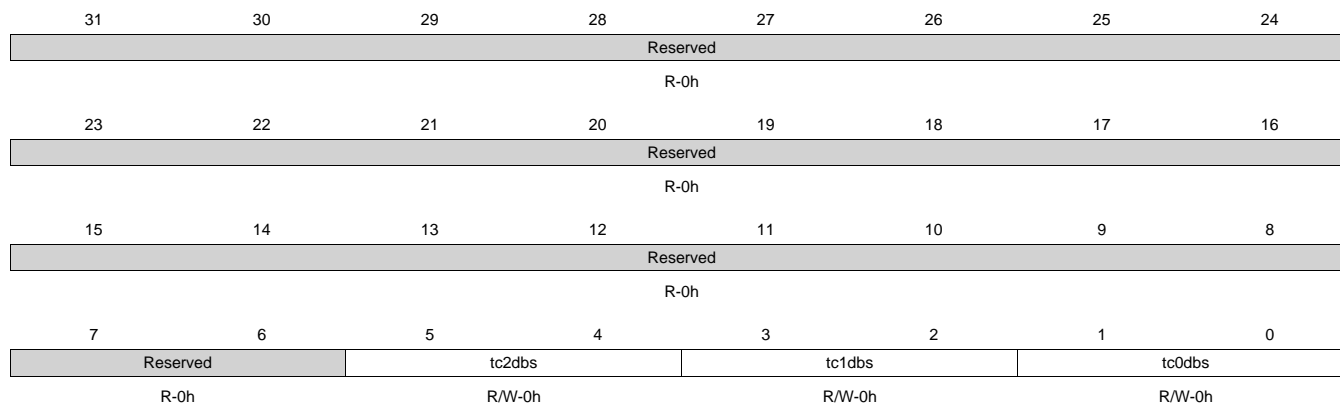

**Table 9-29. mmu\_cfg Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	Reserved	R	0h	
15	mmu_abort	R/W	0h	MMU abort operation This bit causes the MMU to abort the current operation in case of lockup.
14-8	Reserved	R	0h	
7	mmu_disable	R/W	0h	MMU Disable Setting this bit disables MMU table lookup and causes accesses to use the non-translated address. This bit defaults to enabled but an identical bit within an MMU configuration register defaults to disabled and must be set after the page tables are programmed for MMU operation.
6-0	Reserved	R	0h	

### 9.3.20 tptc\_cfg Register (offset = 614h) [reset = 0h]

tptc\_cfg is shown in Figure 9-23 and described in Table 9-30.

**Figure 9-23. tptc\_cfg Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-30. tptc\_cfg Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-6	Reserved	R	0h	
5-4	tc2dbs	R/W	0h	TPTC2 Default Burst Size 00: 16 byte 01: 32 byte 10: 64 byte 11: 128 byte
3-2	tc1dbs	R/W	0h	TPTC1 Default Burst Size 00: 16 byte 01: 32 byte 10: 64 byte 11: 128 byte
1-0	tc0dbs	R/W	0h	TPTC0 Default Burst Size 00: 16 byte 01: 32 byte 10: 64 byte 11: 128 byte

### 9.3.21 usb\_ctrl0 Register (offset = 620h) [reset = 0h]

usb\_ctrl0 is shown in Figure 9-24 and described in Table 9-31.

**Figure 9-24. usb\_ctrl0 Register**

### 9.3.25 mac\_id0\_lo Register (offset = 630h) [reset = 0h]

mac\_id0\_lo is shown in [Figure 9-28](#) and described in [Table 9-35](#).

**Figure 9-28. mac\_id0\_lo Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-35. mac\_id0\_lo Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	Reserved	R	0h	
15-8	macaddr_7_0	R	0h	MAC0 Address - Byte 0 Reset value is device-dependent.
7-0	macaddr_15_8	R	0h	MAC0 Address - Byte 1 Reset value is device-dependent.

### 9.3.26 mac\_id0\_hi Register (offset = 634h) [reset = 0h]

mac\_id0\_hi is shown in Figure 9-29 and described in Table 9-36.

**Figure 9-29. mac\_id0\_hi Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

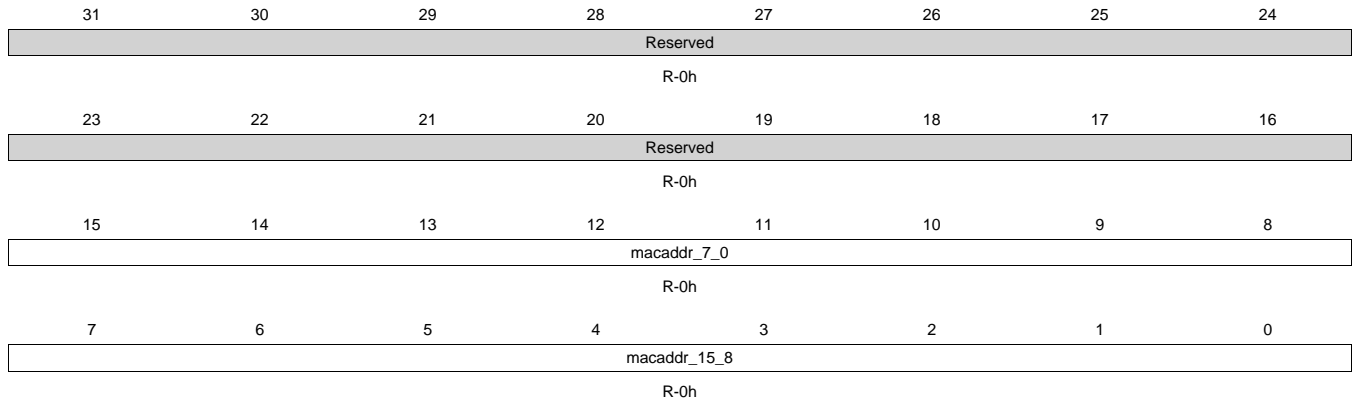

**Table 9-36. mac\_id0\_hi Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	macaddr_23_16	R	0h	MAC0 Address - Byte 2 Reset value is device-dependent.
23-16	macaddr_31_24	R	0h	MAC0 Address - Byte 3 Reset value is device-dependent.
15-8	macaddr_39_32	R	0h	MAC0 Address - Byte 4 Reset value is device-dependent.
7-0	macaddr_47_40	R	0h	MAC0 Address - Byte 5 Reset value is device-dependent.

### 9.3.27 mac\_id1\_lo Register (offset = 638h) [reset = 0h]

mac\_id1\_lo is shown in [Figure 9-30](#) and described in [Table 9-37](#).

**Figure 9-30. mac\_id1\_lo Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-37. mac\_id1\_lo Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	Reserved	R	0h	
15-8	macaddr_7_0	R	0h	MAC1 Address - Byte 0 Reset value is device-dependent.
7-0	macaddr_15_8	R	0h	MAC1 Address - Byte 1 Reset value is device-dependent.

### 9.3.28 mac\_id1\_hi Register (offset = 63Ch) [reset = 0h]

mac\_id1\_hi is shown in Figure 9-31 and described in Table 9-38.

**Figure 9-31. mac\_id1\_hi Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-38. mac\_id1\_hi Register Field Descriptions**

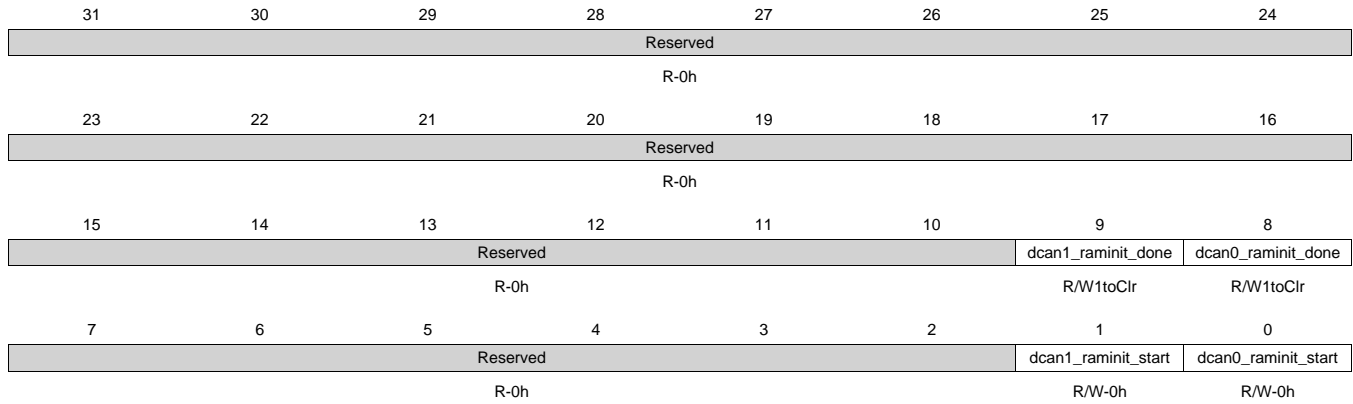

Bit	Field	Type	Reset	Description
31-24	macaddr_23_16	R	0h	MAC1 Address - Byte 2 Reset value is device-dependent.
23-16	macaddr_31_24	R	0h	MAC1 Address - Byte 3 Reset value is device-dependent.
15-8	macaddr_39_32	R	0h	MAC1 Address - Byte 4 Reset value is device-dependent.
7-0	macaddr_47_40	R	0h	MAC1 Address - Byte 5 Reset value is device-dependent.

### 9.3.29 dcan\_raminit Register (offset = 644h) [reset = 0h]

dcan\_raminit is shown in Figure 9-32 and described in Table 9-39.

**Figure 9-32. dcan\_raminit Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

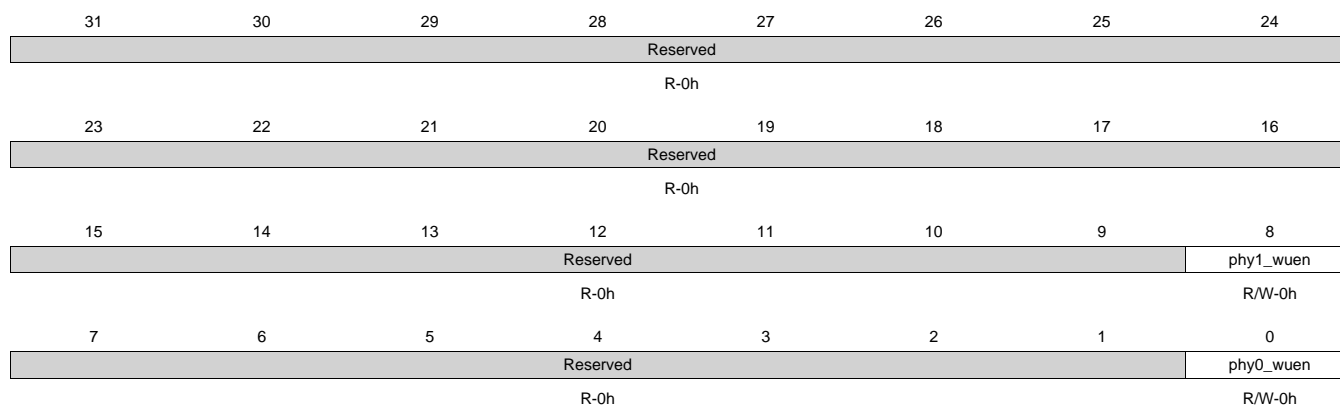

**Table 9-39. dcan\_raminit Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-10	Reserved	R	0h	
9	dcan1_raminit_done	R/W1toClr	0h	0: DCAN1 RAM Initialization NOT complete 1: DCAN1 RAM Initialization complete
8	dcan0_raminit_done	R/W1toClr	0h	0: DCAN0 RAM Initialization NOT complete 1: DCAN0 RAM Initialization complete
7-2	Reserved	R	0h	
1	dcan1_raminit_start	R/W	0h	A transition from 0 to 1 will start DCAN1 RAM initialization sequence.
0	dcan0_raminit_start	R/W	0h	A transition from 0 to 1 will start DCAN0 RAM initialization sequence.

### 9.3.30 usb\_wkup\_ctrl Register (offset = 648h) [reset = 0h]

usb\_wkup\_ctrl is shown in [Figure 9-33](#) and described in [Table 9-40](#).

**Figure 9-33. usb\_wkup\_ctrl Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-40. usb\_wkup\_ctrl Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-9	Reserved	R	0h	
8	phy1_wuen	R/W	0h	PHY1 Wakeup Enable. Write to 1 enables WKUP from USB PHY1
7-1	Reserved	R	0h	
0	phy0_wuen	R/W	0h	PHY0 Wakeup Enable. Write to 1 enables WKUP from USB PHY0

### 9.3.31 gmii\_sel Register (offset = 650h) [reset = 0h]

gmii\_sel is shown in Figure 9-34 and described in Table 9-41.

**Figure 9-34. gmii\_sel Register**

2-0	sab_init0	R/W	0h	MReqPriority for MPU Initiator 0 OCP Interface

### 9.3.34 mreqprio\_1 Register (offset = 674h) [reset = 0h]

mreqprio\_1 is shown in [Figure 9-37](#) and described in [Table 9-44](#).

**Figure 9-37. mreqprio\_1 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-44. mreqprio\_1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2-0	exp	R/W	0h	MReqPriority for Expansion Initiator OCP Interface

### 9.3.35 hw\_event\_sel\_grp1 Register (offset = 690h) [reset = 0h]

hw\_event\_sel\_grp1 is shown in [Figure 9-38](#) and described in [Table 9-45](#).

**Figure 9-38. hw\_event\_sel\_grp1 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

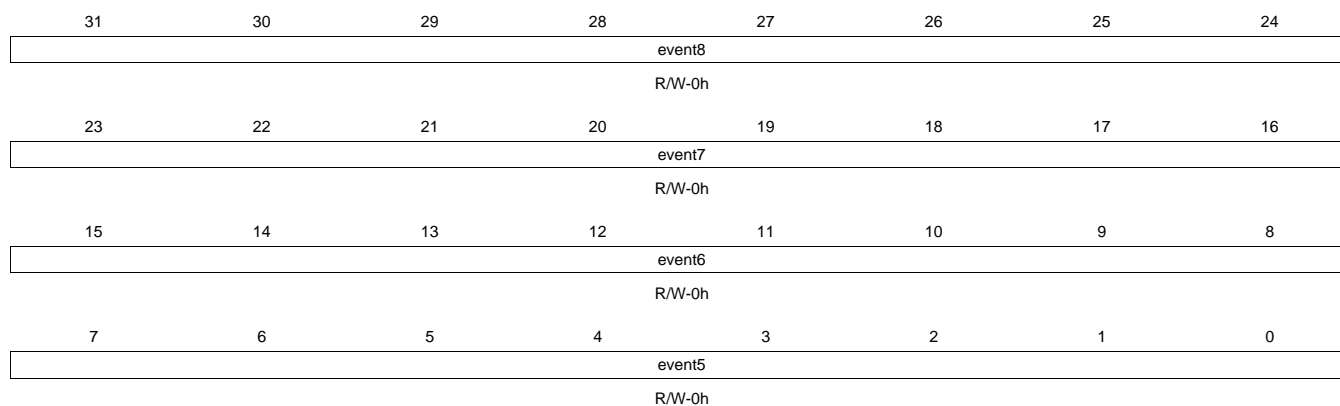

**Table 9-45. hw\_event\_sel\_grp1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	event4	R/W	0h	Select 4th trace event from group 1
23-16	event3	R/W	0h	Select 3rd trace event from group 1
15-8	event2	R/W	0h	Select 2nd trace event from group 1
7-0	event1	R/W	0h	Select 1st trace event from group 1

### 9.3.36 hw\_event\_sel\_grp2 Register (offset = 694h) [reset = 0h]

hw\_event\_sel\_grp2 is shown in [Figure 9-39](#) and described in [Table 9-46](#).

**Figure 9-39. hw\_event\_sel\_grp2 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-46. hw\_event\_sel\_grp2 Register Field Descriptions**

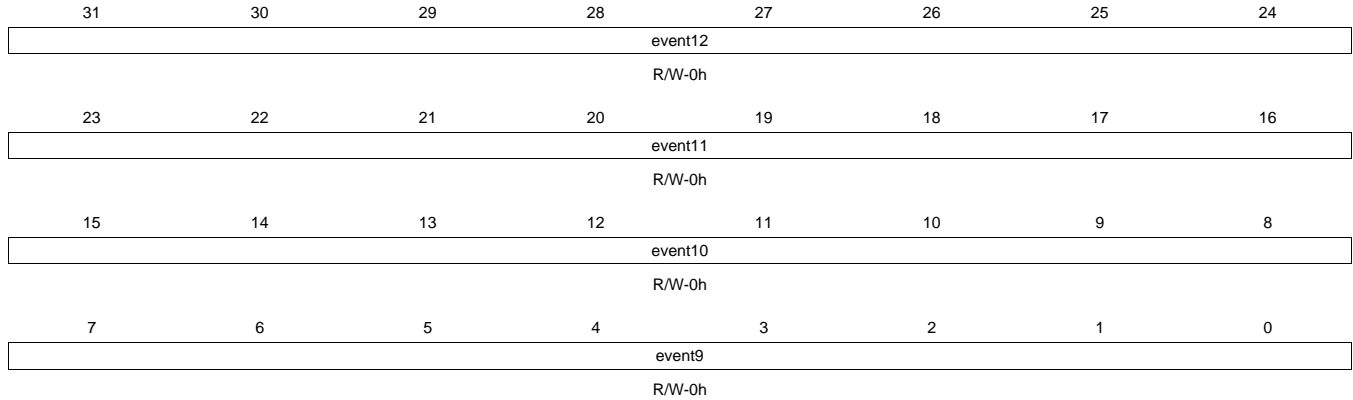

Bit	Field	Type	Reset	Description
31-24	event8	R/W	0h	Select 8th trace event from group 2
23-16	event7	R/W	0h	Select 7th trace event from group 2
15-8	event6	R/W	0h	Select 6th trace event from group 2
7-0	event5	R/W	0h	Select 5th trace event from group 2

### 9.3.37 hw\_event\_sel\_grp3 Register (offset = 698h) [reset = 0h]

hw\_event\_sel\_grp3 is shown in [Figure 9-40](#) and described in [Table 9-47](#).

**Figure 9-40. hw\_event\_sel\_grp3 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-47. hw\_event\_sel\_grp3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	event12	R/W	0h	Select 12th trace event from group 3
23-16	event11	R/W	0h	Select 11th trace event from group 3
15-8	event10	R/W	0h	Select 10th trace event from group 3
7-0	event9	R/W	0h	Select 9th trace event from group 3

**9.3.38 hw\_event\_sel\_grp4 Register (offset = 69Ch) [reset = 0h]**

hw\_event\_sel\_grp4 is shown in [Figure 9-41](#) and described in [Table 9-48](#).

**Figure 9-41. hw\_event\_sel\_grp4 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-48. hw\_event\_sel\_grp4 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	event16	R/W	0h	Select 16th trace event from group 4
23-16	event15	R/W	0h	Select 15th trace event from group 4
15-8	event14	R/W	0h	Select 14th trace event from group 4
7-0	event13	R/W	0h	Select 13th trace event from group 4

### 9.3.39 smrt\_ctrl Register (offset = 6A0h) [reset = 0h]

smrt\_ctrl is shown in [Figure 9-42](#) and described in [Table 9-49](#).

**Figure 9-42. smrt\_ctrl Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-49. smrt\_ctrl Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	Reserved	R	0h	
1	sr1_sleep	R/W	0h	0: Disable sensor (SRSLEEP on sensor driven to 1) 1: Enable sensor (SRSLEEP on sensor driven to 0).
0	sr0_sleep	R/W	0h	0: Disable sensor (SRSLEEP on sensor driven to 1) 1: Enable sensor (SRSLEEP on sensor driven to 0).

### 9.3.40 mpuss\_hw\_debug\_sel Register (offset = 6A4h) [reset = 0h]

mpuss\_hw\_debug\_sel is shown in Figure 9-43 and described in Table 9-50.

**Figure 9-43. mpuss\_hw\_debug\_sel Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-50. mpuss\_hw\_debug\_sel Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-10	Reserved	R	0h	
9	hw_dbg_gate_en	R/W	0h	To save power input to MPUSS_HW_DBG_INFO is gated off to all zeros when HW_DBG_GATE_EN bit is low. 0: Debug info gated off 1: Debug info not gated off
8	Reserved	R	0h	
7-4	Reserved	R	0h	
3-0	hw_dbg_sel	R/W	0h	Selects which Group of signals are sent out to the MODENA_HW_DBG_INFO register. Please see MPU functional spec for more details 0000: Group 0 0001: Group 1 0010: Group 2 0011: Group 3 0100: Group 4 0101: Group 5 0110: Group 6 0111: Group 7 1xxx: Reserved

### 9.3.41 mpuss\_hw\_dbg\_info Register (offset = 6A8h) [reset = 0h]

mpuss\_hw\_dbg\_info is shown in [Figure 9-44](#) and described in [Table 9-51](#).

**Figure 9-44. mpuss\_hw\_dbg\_info Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-51. mpuss\_hw\_dbg\_info Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	hw_dbg_info	R	0h	Hardware Debug Info from MPU.

**9.3.42 vdd\_mpu\_opp\_050 Register (offset = 770h) [reset = 0h]**

vdd\_mpu\_opp\_050 is shown in [Figure 9-45](#) and described in [Table 9-52](#).

**Figure 9-45. vdd\_mpu\_opp\_050 Register**

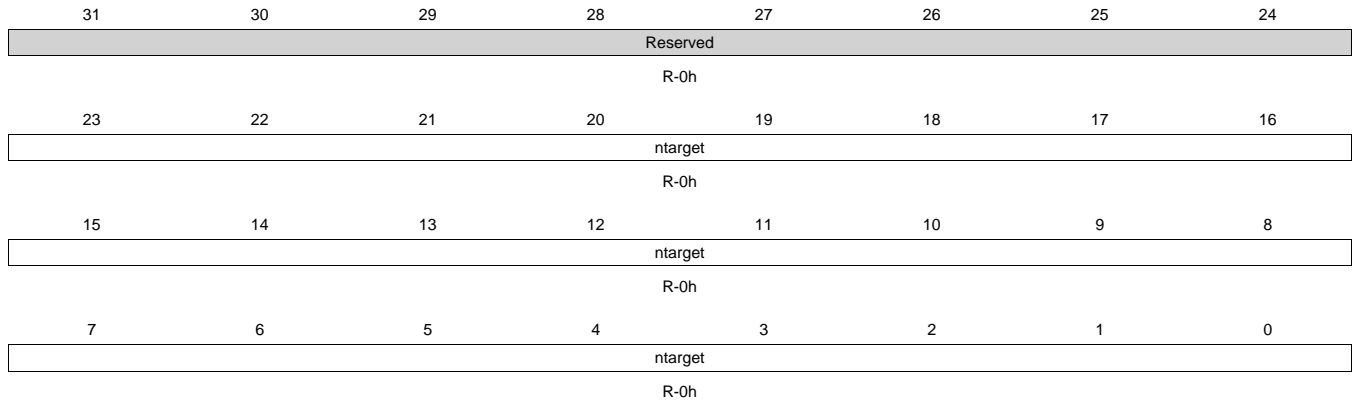

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-52. vdd\_mpu\_opp\_050 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	Reserved	R	0h	
23-0	ntarget	R	0h	Ntarget value for MPU Voltage domain OPP50 Reset value is device-dependent.

**9.3.43 vdd\_mpu\_opp\_100 Register (offset = 774h) [reset = 0h]**

vdd\_mpu\_opp\_100 is shown in [Figure 9-46](#) and described in [Table 9-53](#).

**Figure 9-46. vdd\_mpu\_opp\_100 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

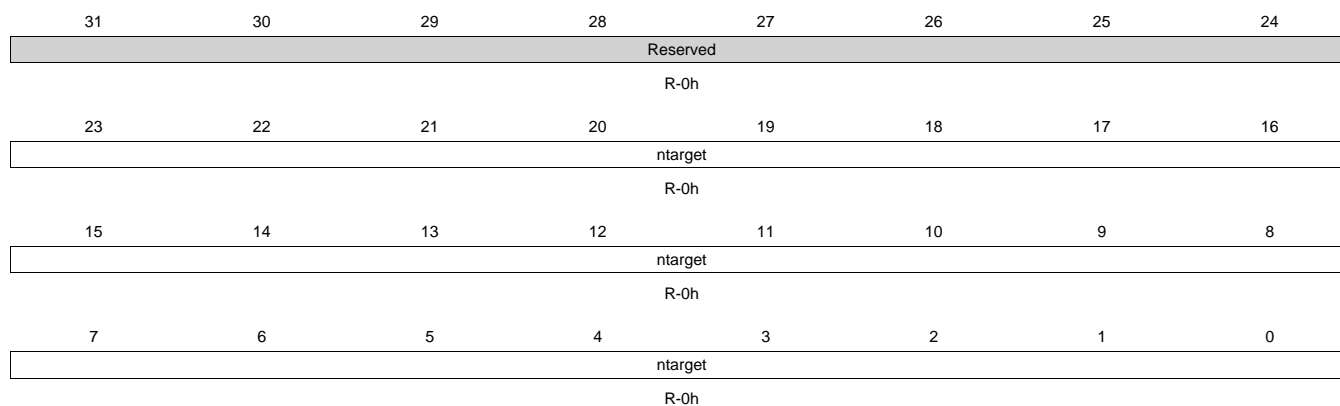

**Table 9-53. vdd\_mpu\_opp\_100 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	Reserved	R	0h	
23-0	ntarget	R	0h	Ntarget value for MPU Voltage domain OPP100 Reset value is device-dependent.

### 9.3.44 vdd\_mpu\_opp\_120 Register (offset = 778h) [reset = 0h]

vdd\_mpu\_opp\_120 is shown in [Figure 9-47](#) and described in [Table 9-54](#).

**Figure 9-47. vdd\_mpu\_opp\_120 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-54. vdd\_mpu\_opp\_120 Register Field Descriptions**

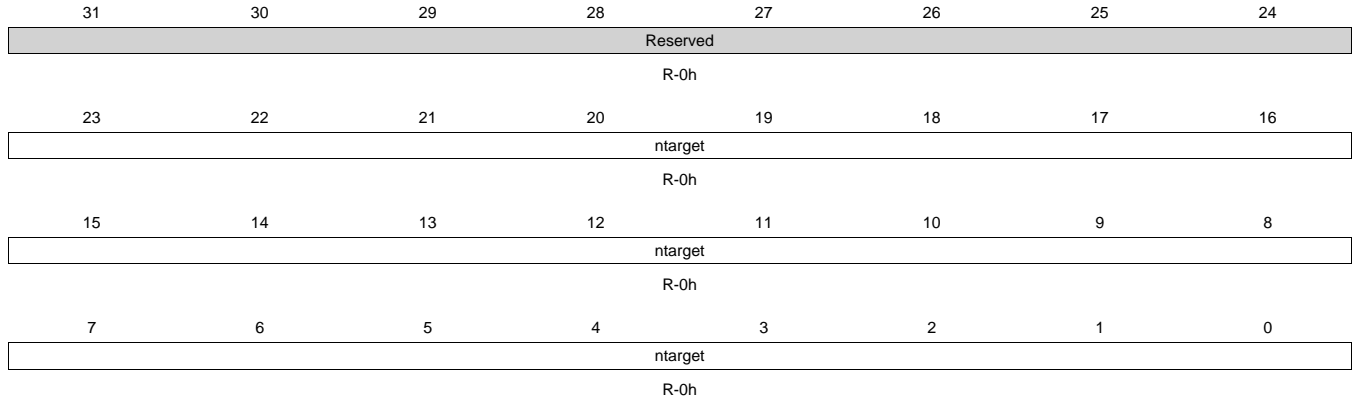

Bit	Field	Type	Reset	Description
31-24	Reserved	R	0h	
23-0	ntarget	R	0h	Ntarget value for MPU Voltage domain OPP120 Reset value is device-dependent.

### 9.3.45 vdd\_mpu\_opp\_turbo Register (offset = 77Ch) [reset = 0h]

vdd\_mpu\_opp\_turbo is shown in [Figure 9-48](#) and described in [Table 9-55](#).

**Figure 9-48. vdd\_mpu\_opp\_turbo Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-55. vdd\_mpu\_opp\_turbo Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	Reserved	R	0h	
23-0	ntarget	R	0h	Ntarget value for MPU Voltage domain OPPTURBO Reset value is device-dependent.

### 9.3.46 vdd\_core\_opp\_050 Register (offset = 7B8h) [reset = 0h]

vdd\_core\_opp\_050 is shown in [Figure 9-49](#) and described in [Table 9-56](#).

**Figure 9-49. vdd\_core\_opp\_050 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-56. vdd\_core\_opp\_050 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	Reserved	R	0h	
23-0	ntarget	R	0h	Ntarget value for CORE Voltage domain OPP50 Reset value is device-dependent.

### 9.3.47 vdd\_core\_opp\_100 Register (offset = 7BCh) [reset = 0h]

vdd\_core\_opp\_100 is shown in [Figure 9-50](#) and described in [Table 9-57](#).

**Figure 9-50. vdd\_core\_opp\_100 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-57. vdd\_core\_opp\_100 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	Reserved	R	0h	
23-0	ntarget	R	0h	Ntarget value for CORE Voltage domain OPP100 Reset value is device-dependent.

### 9.3.48 bb\_scale Register (offset = 7D0h) [reset = 0h]

bb\_scale is shown in Figure 9-51 and described in Table 9-58.

Figure 9-51. bb\_scale Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

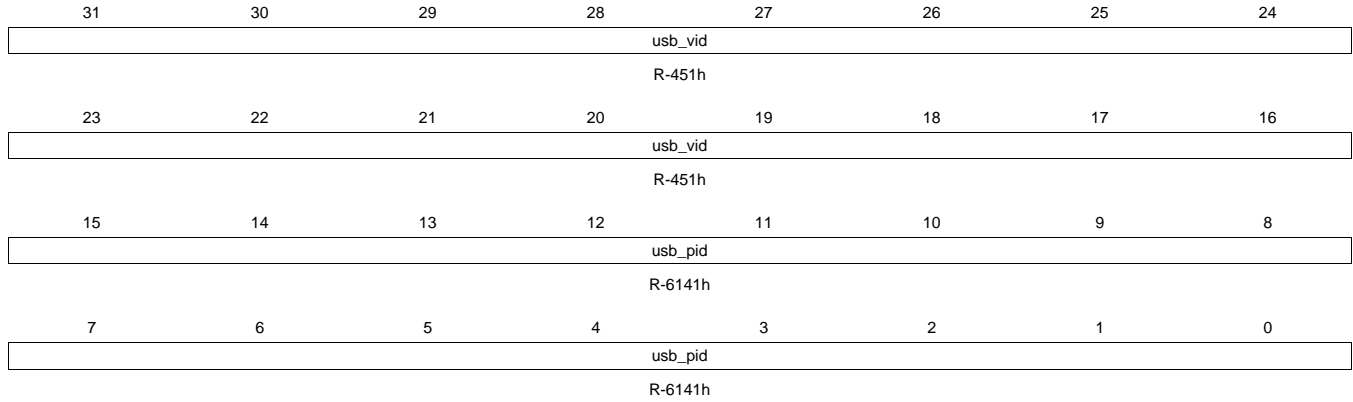

Table 9-58. bb\_scale Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	Reserved	R	0h	
11-8	scale	R	0h	Dynamic core voltage scaling for class 0
7-2	Reserved	R	0h	
1-0	bbias	R	0h	BBIAS value from Efuse

### 9.3.49 usb\_vid\_pid Register (offset = 7F4h) [reset = 4516141h]

usb\_vid\_pid is shown in [Figure 9-52](#) and described in [Table 9-59](#).

**Figure 9-52. usb\_vid\_pid Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-59. usb\_vid\_pid Register Field Descriptions**

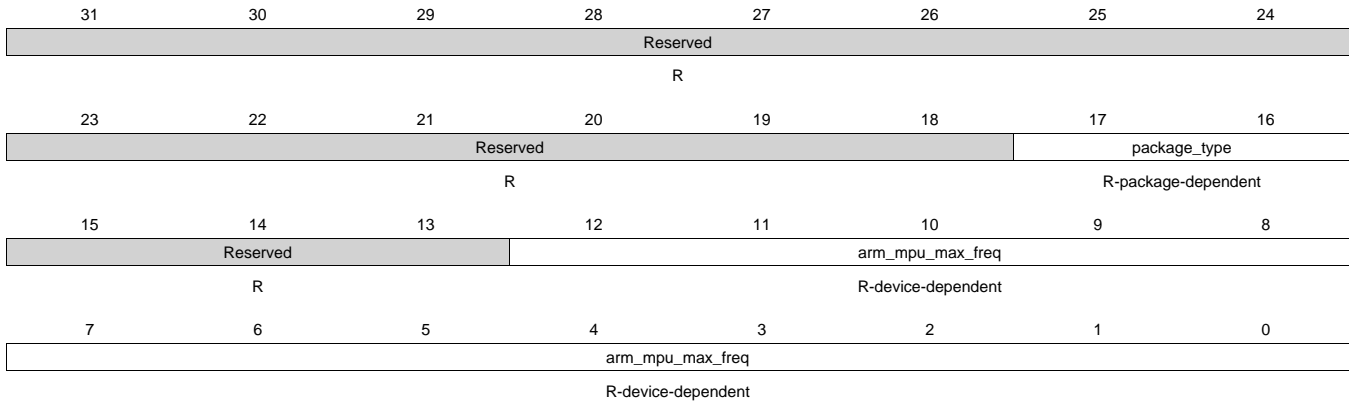

Bit	Field	Type	Reset	Description
31-16	usb_vid	R	0x451	USB Vendor ID
15-0	usb_pid	R	0x6141	USB Product ID

### 9.3.50 efuse\_sma Register (offset = 7FCh) [reset = 0h]

This register describes the device's ARM maximum frequency capabilities and package type. Note that this register is only applicable in PG2.x. The contents of this register is not applicable in PG1.0 devices.

efuse\_sma is shown in [Figure 9-53](#) and described in [Table 9-60](#).

**Figure 9-53. efuse\_sma Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-60. efuse\_sma Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-18	Reserved	R		These bits are undefined and contents can vary from device to device.
17-16	package_type	R	Package-dependent	Designates the Package type of the device (PG2.x only). 00b - Undefined 01b - ZCZ Package 10b - ZCE Package 11b - Reserved
15-13	Reserved	R		These bits are undefined and contents can vary from device to device.
12-0	arm_mpu_max_freq	R	Device-dependent	Designates the ARM MPU Maximum Frequency supported by the device (PG2.x only). There are also voltage requirements that accompany each frequency (OPPs). See the device specific data manual for this information and for information on device variants. 0x1FEF - 300 MHz ARM MPU Maximum (ZCZ Package only) 0x1FAF - 600 MHz ARM MPU Maximum (ZCZ Package only) 0x1F2F - 720 MHz ARM MPU Maximum (ZCZ Package only) 0x1E2F - 800 MHz ARM MPU Maximum (ZCZ Package only) 0x1C2F - 1 GHz ARM MPU Maximum (ZCZ Package only) 0x1FDF - 300 MHz ARM MPU Maximum (ZCE Package only) 0x1F9F - 600 MHz ARM MPU Maximum (ZCE Package only) All other values are reserved.

### 9.3.51 conf\_<module>\_<pin> Register (offset = 800h–A34h)

See the device datasheet for information on default pin mux configurations. Note that the device ROM may change the default pin mux for certain pins based on the SYSBOOT mode settings.

See [Table 9-10](#), *Control Module Registers Table*, for the full list of offsets for each module/pin configuration.

conf\_<module>\_<pin> is shown in [Figure 9-54](#) and described in [Table 9-61](#).

**Figure 9-54. conf\_<module>\_<pin> Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-61. conf\_<module>\_<pin> Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-20	Reserved	R	0h	
19-7	Reserved	R	0h	
6	conf_<module>_<pin>_slewctrl	R/W	X	Select between faster or slower slew rate 0: Fast 1: Slow Reset value is pad-dependent.
5	conf_<module>_<pin>_rxactive	R/W	1h	Input enable value for the PAD 0: Receiver disabled 1: Receiver enabled
4	conf_<module>_<pin>_putypesel	R/W	X	Pad pullup/pulldown type selection 0: Pulldown selected 1: Pullup selected Reset value is pad-dependent.
3	conf_<module>_<pin>_puden	R/W	X	Pad pullup/pulldown enable 0: Pullup/pulldown enabled 1: Pullup/pulldown disabled Reset value is pad-dependent.
2-0	conf_<module>_<pin>_mmode	R/W	X	Pad functional signal mux select. Reset value is pad-dependent.

### 9.3.52 cqdetect\_status Register (offset = E00h) [reset = 0h]

cqdetect\_status is shown in Figure 9-55 and described in Table 9-62.

**Figure 9-55. cqdetect\_status Register**

**Table 9-64. vtp\_ctrl Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-23	Reserved	R	0h	
22-16	pcin	R	1h	Default/reset values of 'P' for the VTP controller. See "Silicon Revision Functional Differences and Enhancements" for differences in operation based on AM335x silicon revision.
15	Reserved	R	0h	
14-8	ncin	R	1h	Default/reset values of 'N' for the VTP controller. See "Silicon Revision Functional Differences and Enhancements" for differences in operation based on AM335x silicon revision.
7	Reserved	R	0h	
6	enable	R/W	0h	0: VTP macro in bypass mode. P and N are driven from PCIN and NCIN. 1: Dynamic VTP compensation mode
5	ready	R	0h	0: Training sequence is not complete 1: Training sequence is complete
4	lock	R/W	0h	0: Normal operation dynamic update 1: freeze dynamic update, pwrndn controller
3-1	filter	R/W	0h	Digital filter bits to prevent the controller from making excessive number of changes. 000: Filter off 001: Update on two consecutive update requests 010: Update on three consecutive update requests 011: Update on four consecutive update requests 100: Update on five consecutive update requests 101: Update on six consecutive update requests 110: Update on seven consecutive update requests 111: Update on eight consecutive update requests
0	clrz	R/W	0h	clears flops, start count again, after low going pulse

### 9.3.55 vref\_ctrl Register (offset = E14h) [reset = 0h]

vref\_ctrl is shown in Figure 9-58 and described in Table 9-65.

**Figure 9-58. vref\_ctrl Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

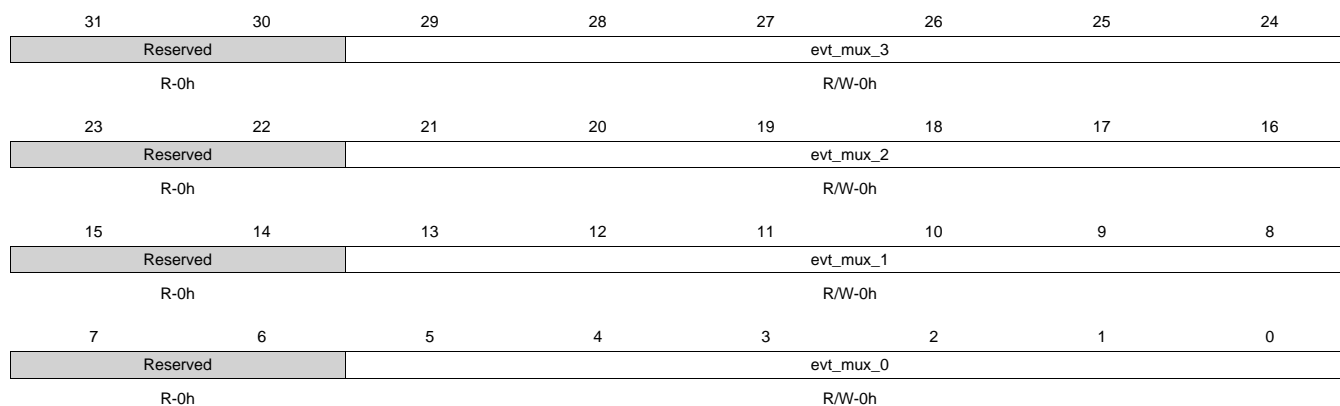

**Table 9-65. vref\_ctrl Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-5	Reserved	R	0h	
4-3	ddr_vref_ccap	R/W	0h	select for coupling cap for DDR 00 : No capacitor connected 01 : Capacitor between BIAS2 and VSS 10 : Capacitor between BIAS2 and VDDS 11: Capacitor between BIAS2 and VSS andamp Capacitor between BIAS2 and VDDS
2-1	ddr_vref_tap	R/W	0h	select for int ref for DDR 00 : Pad/Bias2 connected to internal reference VDDS/2 for 2uA current load 01 : Pad/Bias2 connected to internal reference VDDS/2 for 4uA current load 10 : Pad/Bias2 connected to internal reference VDDS/2 for 6uA current load 11 : Pad/Bias2 connected to internal reference VDDS/2 for 8uA current load
0	ddr_vref_en	R/W	0h	active high internal reference enable for DDR

### 9.3.56 tpcc\_evt\_mux\_0\_3 Register (offset = F90h) [reset = 0h]

tpcc\_evt\_mux\_0\_3 is shown in Figure 9-59 and described in Table 9-66.

**Figure 9-59. tpcc\_evt\_mux\_0\_3 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-66. tpcc\_evt\_mux\_0\_3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-30	Reserved	R	0h	
29-24	evt_mux_3	R/W	0h	Selects 1 of 64 inputs for DMA event 3
23-22	Reserved	R	0h	
21-16	evt_mux_2	R/W	0h	Selects 1 of 64 inputs for DMA event 2
15-14	Reserved	R	0h	
13-8	evt_mux_1	R/W	0h	Selects 1 of 64 inputs for DMA event 1
7-6	Reserved	R	0h	
5-0	evt_mux_0	R/W	0h	Selects 1 of 64 inputs for DMA event 0

**9.3.57 tpcc\_evt\_mux\_4\_7 Register (offset = F94h) [reset = 0h]**

tpcc\_evt\_mux\_4\_7 is shown in Figure 9-60 and described in Table 9-67.

**Figure 9-60. tpcc\_evt\_mux\_4\_7 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-67. tpcc\_evt\_mux\_4\_7 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-30	Reserved	R	0h	
29-24	evt_mux_7	R/W	0h	Selects 1 of 64 inputs for DMA event 7
23-22	Reserved	R	0h	
21-16	evt_mux_6	R/W	0h	Selects 1 of 64 inputs for DMA event 6
15-14	Reserved	R	0h	
13-8	evt_mux_5	R/W	0h	Selects 1 of 64 inputs for DMA event 5
7-6	Reserved	R	0h	
5-0	evt_mux_4	R/W	0h	Selects 1 of 64 inputs for DMA event 4

### 9.3.58 tpcc\_evt\_mux\_8\_11 Register (offset = F98h) [reset = 0h]

tpcc\_evt\_mux\_8\_11 is shown in Figure 9-61 and described in Table 9-68.

**Figure 9-61. tpcc\_evt\_mux\_8\_11 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-68. tpcc\_evt\_mux\_8\_11 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-30	Reserved	R	0h	
29-24	evt_mux_11	R/W	0h	Selects 1 of 64 inputs for DMA event 11

7-6	Reserved	R	0h	
5-0	evt_mux_60	R/W	0h	Selects 1 of 64 inputs for DMA event 60

### 9.3.72 timer\_evt\_capt Register (offset = FD0h) [reset = 0h]

timer\_evt\_capt is shown in Figure 9-75 and described in Table 9-82.

**Figure 9-75. timer\_evt\_capt Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-82. timer\_evt\_capt Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-21	Reserved	R	0h	
20-16	timer7_evtcapt	R/W	0h	Timer 7 event capture mux
15-13	Reserved	R	0h	
12-8	timer6_evtcapt	R/W	0h	Timer 6 event capture mux
7-5	Reserved	R	0h	
4-0	timer5_evtcapt	R/W	0h	Timer 5 event capture mux

### 9.3.73 ecap\_evt\_capt Register (offset = FD4h) [reset = 0h]

ecap\_evt\_capt is shown in Figure 9-76 and described in Table 9-83.

**Figure 9-76. ecap\_evt\_capt Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

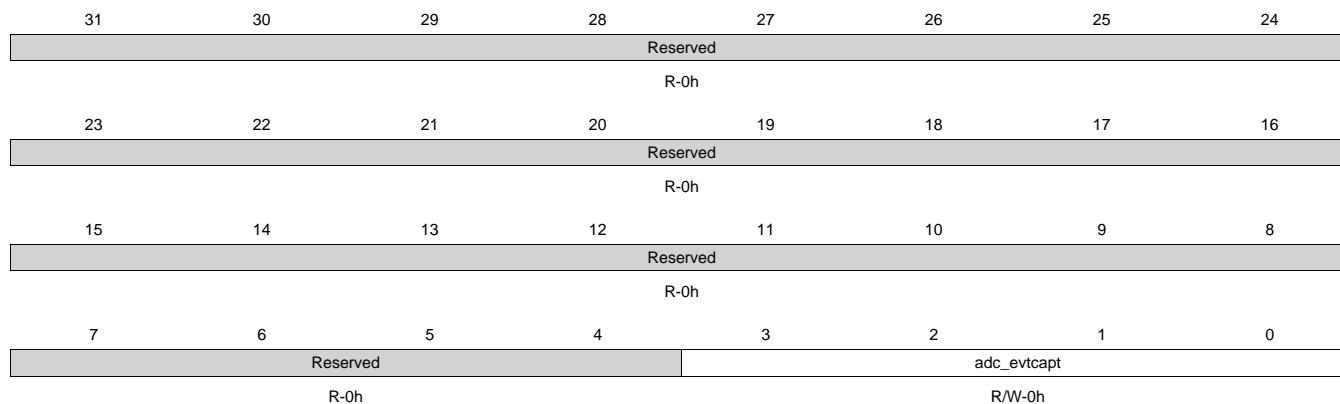

**Table 9-83. ecap\_evt\_capt Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-21	Reserved	R	0h	
20-16	ecap2_evtcapt	R/W	0h	ECAP2 event capture mux
15-13	Reserved	R	0h	
12-8	ecap1_evtcapt	R/W	0h	ECAP1 event capture mux
7-5	Reserved	R	0h	
4-0	ecap0_evtcapt	R/W	0h	ECAP0 event capture mux

### 9.3.74 adc\_evt\_capt Register (offset = FD8h) [reset = 0h]

adc\_evt\_capt is shown in Figure 9-77 and described in Table 9-84.

**Figure 9-77. adc\_evt\_capt Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

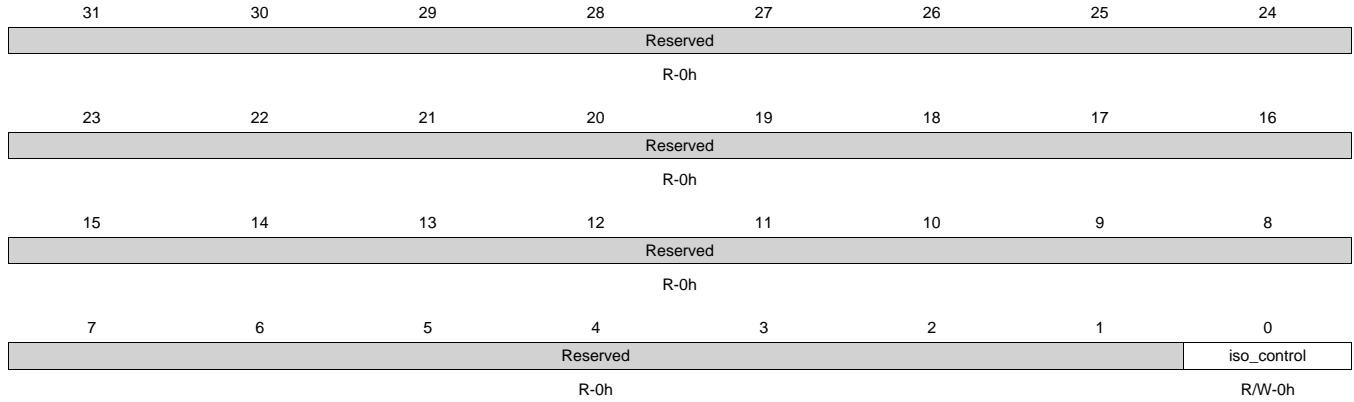

**Table 9-84. adc\_evt\_capt Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	Reserved	R	0h	
3-0	adc_evtcapt	R/W	0h	ECAP0 event capture mux

**9.3.75 reset\_iso Register (offset = 1000h) [reset = 0h]**

reset\_iso is shown in [Figure 9-78](#) and described in [Table 9-85](#).

**Figure 9-78. reset\_iso Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-85. reset\_iso Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	iso_control	R/W	0h	0 : Ethernet Switch is not isolated 1 : Ethernet Switch is isolated

### 9.3.76 dpll\_pwr\_sw\_ctrl Register (offset = 1318h) [reset = 0h]

The DPLL\_PWR\_SW\_CTRL register, in conjunction with the DPLL\_PWR\_SW\_STATUS register, can be used to power off the digital power domain of the 3 DPLLs – DDR, DISP, PER to save leakage power in deep-sleep power modes. This register gives control over the power switch signals of the individual DPLLs.

A specific sequence has to be followed while programming the RET, PONIN, PGOODIN, ISO and RESET signals to put the PLLs in to low power mode and bring it out of low power mode.

In normal operating mode, the PRCM controls the RESET of the DPLLs. The RET, PONIN, PGOODIN and ISO are tied off. An over-ride bit is provided in this register SW\_CTRL\_\*\_RESET, which when set allows S/W to control the RESET, RET, PONIN, PGOODIN and ISO of the DPLLs to enable entry/exit into DPLL low power modes.

dpll\_pwr\_sw\_ctrl is shown in [Figure 9-79](#) and described in [Table 9-86](#).

**Figure 9-79. dpll\_pwr\_sw\_ctrl Register**

**Table 9-86. dpll\_pwr\_sw\_ctrl Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	sw_ctrl_dds_pll	R/W	0h	Enable software control over DDR DPLL RET, RESET, ISO, PGOODIN, PONIN for power savings. 0: PRCM controls the DPLL reset, RET = 0, ISO = 0, PGOODIN = 1, PONIN = 1. 1: Controlled by corresponding bits in this register.
30	Reserved	R	0h	
29	isoscanner_dds	R/W	0h	Drives ISOSCAN of DDR PLL.
28	ret_dds	R/W	0h	Drives RET signal of DDR PLL.
27	reset_dds	R/W	0h	Drives RESET of DDR DPLL.
26	iso_dds	R/W	0h	Drives ISO of DDR DPLL.
25	pgoodin_dds	R/W	1h	Drives PGOODIN of DDR DPLL.
24	ponin_dds	R/W	1h	Drives PONIN of DDR DPLL.
23	sw_ctrl_disp_pll	R/W	0h	Enable software control over DISP DPLL RET, RESET, ISO, PGOODIN, PONIN for power savings. 0: PRCM controls the DPLL reset, RET = 0, ISO = 0, PGOODIN = 1, PONIN = 1. 1: Controlled by corresponding bits in this register.
22	Reserved	R	0h	
21	isoscanner_disp	R/W	0h	Drives ISOSCAN of DISP PLL.
20	ret_disp	R/W	0h	Drives RET of DISP DPLL.
19	reset_disp	R/W	0h	Drives RESET of DISP DPLL.

**Table 9-86. dpll\_pwr\_sw\_ctrl Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
18	iso_disp	R/W	0h	Drives ISO of DISP DPLL.
17	pgoodin_disp	R/W	1h	Drives PGOODIN of DISP DPLL.
16	ponin_disp	R/W	1h	Drives PONIN of DISP DPLL.
15	sw_ctrl_per_dpll	R/W	0h	Enable software control over PER DPLL RET, RESET, ISO, PGOODIN, PONIN for power savings. 0: PRCM controls the DPLL reset, RET = 0, ISO = 0, PGOODIN = 1, PONIN = 1. 1: Controlled by corresponding bits in this register.
14	Reserved	R	0h	
13	isoscan_per	R/W	0h	Drives ISOSCAN of PER PLL.
12	ret_per	R/W	0h	Drives RET of PER DPLL.
11	reset_per	R/W	0h	Drives RESET signal of PER DPLL.
10	iso_per	R/W	0h	Drives ISO signal of PER DPLL.
9	pgoodin_per	R/W	1h	Drives PGOODIN signal of PER DPLL.
8	ponin_per	R/W	1h	Drives PONIN signal of PER DPLL.
7-0	Reserved	R	0h	

**9.3.77 ddr\_cke\_ctrl Register (offset = 131Ch) [reset = 0h]**

ddr\_cke\_ctrl is shown in [Figure 9-80](#) and described in [Table 9-87](#).

**Figure 9-80. ddr\_cke\_ctrl Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-87. ddr\_cke\_ctrl Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	ddr_cke_ctrl	R/W	0h	CKE from EMIF/DDRPHY is ANDed with this bit. 0: CKE to memories gated off to zero. External DRAM memories will not be able to register DDR commands from device 1: Normal operation. CKE is now controlled by EMIF/DDR PHY.

**9.3.78 sma2 Register (offset = 1320h) [reset = 0h]**

The VSLDO\_CORE\_AUTO\_RAMP\_EN bit when set, allows the VSLDO to be put into retention during deep-sleep thereby enabling lower power consumption. Since the VSLDO is shared b/w WKUP M3 memories and CORE memories, the VSLDO has to be brought out of retention on any wakeup event. The hardware scheme mentioned below achieves this purpose.

sma2 is shown in [Figure 9-81](#) and described in [Table 9-88](#).

**Figure 9-81. sma2 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Bit	Field	Type	Reset	Description
31-2	Reserved	R	0h	
1	vslido_core_auto_ramp_en	R/W	0h	0: PRCM controls VSLDO. 1: Allows hardware to bring VSLDO out of retention on wakeup from deep-sleep.
0	rmii2_crs_dv_mode_sel	R/W	0h	0: Select MMC2_DAT7 on GPMC_A9 pin in MODE3. 1: Select RMII2_CRSDV on GPMC_A9 pin in MODE3.

### 9.3.79 m3\_txev\_eoi Register (offset = 1324h) [reset = 0h]

m3\_txev\_eoi is shown in [Figure 9-82](#) and described in [Table 9-89](#).

**Figure 9-82. m3\_txev\_eoi Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-89. m3\_txev\_eoi Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	m3_txev_eoi	R/W	0h	TXEV (Event) from M3 processor is a pulse signal connected as interrupt to MPU IRQ(78) Since MPU expects level signals. The TXEV pulse from M3 is converted to a level in glue logic. The logic works as follows: -On a 0-1 transition on TXEV, the IRQ[78] is set. -For clearing the interrupt, S/W must do the following: S/W must clear the IRQ[78] by writing a 1 to M3_TXEV_EOI bit in this register This bit is sticky and for re-arming the IRQ[78], S/W must write a 0 to this field in the ISR

### 9.3.80 ipc\_msg\_reg0 Register (offset = 1328h) [reset = 0h]

ipc\_msg\_reg0 is shown in [Figure 9-83](#) and described in [Table 9-90](#). This register is typically used for messaging between Cortex A8 and CortexM3 (WKUP).

See the section "Functional Sequencing for Power Management with Cortex M3" for specific information on how the IPC\_MSG\_REG registers are used to communicate with the Cortex-M3 firmware.

**Figure 9-83. ipc\_msg\_reg0 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-90. ipc\_msg\_reg0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	ipc_msg_reg0	R/W	0h	Inter Processor Messaging Register

### 9.3.81 ipc\_msg\_reg1 Register (offset = 132Ch) [reset = 0h]

ipc\_msg\_reg1 is shown in [Figure 9-84](#) and described in [Table 9-91](#). This register is typically used for messaging between Cortex A8 and CortexM3 (WKUP).

See the section "Functional Sequencing for Power Management with Cortex M3" for specific information on how the IPC\_MSG\_REG registers are used to communicate with the Cortex-M3 firmware.

**Figure 9-84. ipc\_msg\_reg1 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-91. ipc\_msg\_reg1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	ipc_msg_reg1	R/W	0h	Inter Processor Messaging Register

### 9.3.82 ipc\_msg\_reg2 Register (offset = 1330h) [reset = 0h]

ipc\_msg\_reg2 is shown in [Figure 9-85](#) and described in [Table 9-92](#). This register is typically used for messaging between Cortex A8 and CortexM3 (WKUP).

See the section "Functional Sequencing for Power Management with Cortex M3" for specific information on how the IPC\_MSG\_REG registers are used to communicate with the Cortex-M3 firmware.

**Figure 9-85. ipc\_msg\_reg2 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-92. ipc\_msg\_reg2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	ipc_msg_reg2	R/W	0h	Inter Processor Messaging Register

### 9.3.83 ipc\_msg\_reg3 Register (offset = 1334h) [reset = 0h]

ipc\_msg\_reg3 is shown in [Figure 9-86](#) and described in [Table 9-93](#). This register is typically used for messaging between Cortex A8 and CortexM3 (WKUP).

See the section "Functional Sequencing for Power Management with Cortex M3" for specific information on how the IPC\_MSG\_REG registers are used to communicate with the Cortex-M3 firmware.

**Figure 9-86. ipc\_msg\_reg3 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-93. ipc\_msg\_reg3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	ipc_msg_reg3	R/W	0h	Inter Processor Messaging Register

### 9.3.84 ipc\_msg\_reg4 Register (offset = 1338h) [reset = 0h]

ipc\_msg\_reg4 is shown in [Figure 9-87](#) and described in [Table 9-94](#). This register is typically used for messaging between Cortex A8 and CortexM3 (WKUP).

See the section "Functional Sequencing for Power Management with Cortex M3" for specific information on how the IPC\_MSG\_REG registers are used to communicate with the Cortex-M3 firmware.

**Figure 9-87. ipc\_msg\_reg4 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-94. ipc\_msg\_reg4 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	ipc_msg_reg4	R/W	0h	Inter Processor Messaging Register

### 9.3.85 ipc\_msg\_reg5 Register (offset = 133Ch) [reset = 0h]

ipc\_msg\_reg5 is shown in [Figure 9-88](#) and described in [Table 9-95](#). This register is typically used for messaging between Cortex A8 and CortexM3 (WKUP).

See the section "Functional Sequencing for Power Management with Cortex M3" for specific information on how the IPC\_MSG\_REG registers are used to communicate with the Cortex-M3 firmware.

**Figure 9-88. ipc\_msg\_reg5 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-95. ipc\_msg\_reg5 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	ipc_msg_reg5	R/W	0h	Inter Processor Messaging Register

### 9.3.86 ipc\_msg\_reg6 Register (offset = 1340h) [reset = 0h]

ipc\_msg\_reg6 is shown in [Figure 9-89](#) and described in [Table 9-96](#). This register is typically used for messaging between Cortex A8 and CortexM3 (WKUP).

See the section "Functional Sequencing for Power Management with Cortex M3" for specific information on how the IPC\_MSG\_REG registers are used to communicate with the Cortex-M3 firmware.

**Figure 9-89. ipc\_msg\_reg6 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-96. ipc\_msg\_reg6 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	ipc_msg_reg6	R/W	0h	Inter Processor Messaging Register

### 9.3.87 ipc\_msg\_reg7 Register (offset = 1344h) [reset = 0h]

ipc\_msg\_reg7 is shown in [Figure 9-90](#) and described in [Table 9-97](#). This register is typically used for messaging between Cortex A8 and CortexM3 (WKUP).

See the section "Functional Sequencing for Power Management with Cortex M3" for specific information on how the IPC\_MSG\_REG registers are used to communicate with the Cortex-M3 firmware.

**Figure 9-90. ipc\_msg\_reg7 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-97. ipc\_msg\_reg7 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	ipc_msg_reg7	R/W	0h	Inter Processor Messaging Register

### 9.3.88 ddr\_cmd0\_ioctrl Register (offset = 1404h) [reset = 0h]

ddr\_cmd0\_ioctrl is shown in Figure 9-91 and described in Table 9-98.

**Figure 9-91. ddr\_cmd0\_ioctrl Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-98. ddr\_cmd0\_ioctrl Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-21	io_config_gp_wd1	R/W	0h	There are 2 bits per IO: io_config_gp_wd1 and io_config_gp_wd0. For example: macro pin 0: WD1 is bit 21, WD0 is bit 10 macro pin 1: WD1 is bit 22, WD0 is bit 11 ... macro pin 10: WD1 is bit 31, WD0 is bit 20 See the DDR PHY to IO Pin Mapping table in the Control Module Functional Description section for a mapping of macro bits to I/Os. WD1:WD0 00: Pullup/Pulldown disabled 01: Weak pullup enabled 10: Weak pulldown enabled 11: Weak keeper enabled
20-10	io_config_gp_wd0	R/W	0h	There are 2 bits per IO: io_config_gp_wd1 and io_config_gp_wd0. For example: macro pin 0: WD1 is bit 21, WD0 is bit 10 macro pin 1: WD1 is bit 22, WD0 is bit 11 ... macro pin 10: WD1 is bit 31, WD0 is bit 20 See the DDR PHY to IO Pin Mapping table in the Control Module Functional Description section for a mapping of macro bits to I/Os. WD1:WD0 00: Pullup/Pulldown disabled 01: Weak pullup enabled 10: Weak pulldown enabled 11: Weak keeper enabled
9-8	io_config_sr_clk	R	0h	2 bit to program clock IO Pads (DDR_CK/DDR_CKN) output slew rate. These connect as SR1, SR0 to the corresponding DDR IO buffer. See the DDR Slew Rate Control Settings table in the Control Module Functional Description section for a definition of these bits.
7-5	io_config_i_clk	R/W	0h	3-bit configuration input to program clock IO pads (DDR_CK/DDR_CKN) output impedance. These connect as I2, I1, I0 to the corresponding DDR IO buffer. See the DDR Impedance Control Settings table in the Control Module Functional Description section for a definition of these bits.
4-3	io_config_sr	R/W	0h	2 bit to program addr/cmd IO Pads output slew rate. These connect as SR1, SR0 to the corresponding DDR IO buffer. See the DDR Slew Rate Control Settings table in the Control Module Functional Description section for a definition of these bits.

**Table 9-98. ddr\_cmd0\_ioctrl Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
2-0	io_config_i	R/W	0h	3-bit configuration input to program addr/cmd IO output impedance. These connect as I2, I1, I0 to the corresponding DDR IO buffer. See the DDR Impedance Control Settings table in the Control Module Functional Description section for a definition of these bits.

### 9.3.89 ddr\_cmd1\_ioctrl Register (offset = 1408h) [reset = 0h]

ddr\_cmd1\_ioctrl is shown in Figure 9-92 and described in Table 9-99.

**Figure 9-92. ddr\_cmd1\_ioctrl Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-99. ddr\_cmd1\_ioctrl Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-21	io_config_gp_wd1	R/W	0h	There are 2 bits per IO: io_config_gp_wd1 and io_config_gp_wd0. For example: macro pin 0: WD1 is bit 21, WD0 is bit 10 macro pin 1: WD1 is bit 22, WD0 is bit 11 ... macro pin 10: WD1 is bit 31, WD0 is bit 20 See the DDR PHY to IO Pin Mapping table in the Control Module Functional Description section for a mapping of macro bits to I/Os. WD1:WD0 00: Pullup/Pulldown disabled 01: Weak pullup enabled 10: Weak pulldown enabled 11: Weak keeper enabled
20-10	io_config_gp_wd0	R/W	0h	There are 2 bits per IO: io_config_gp_wd1 and io_config_gp_wd0. For example: macro pin 0: WD1 is bit 21, WD0 is bit 10 macro pin 1: WD1 is bit 22, WD0 is bit 11 ... macro pin 10: WD1 is bit 31, WD0 is bit 20 See the DDR PHY to IO Pin Mapping table in the Control Module Functional Description section for a mapping of macro bits to I/Os. WD1:WD0 00: Pullup/Pulldown disabled 01: Weak pullup enabled 10: Weak pulldown enabled 11: Weak keeper enabled
9-8	io_config_sr_clk	R/W	0h	2 bit to program clock IO Pads (DDR_CK/DDR_CKN) output slew rate. These connect as SR1, SR0 to the corresponding DDR IO buffer. See the DDR Slew Rate Control Settings table in the Control Module Functional Description section for a definition of these bits.
7-5	io_config_i_clk	R/W	0h	3-bit configuration input to program clock IO pads (DDR_CK/DDR_CKN) output impedance. These connect as I2, I1, I0 to the corresponding DDR IO buffer. See the DDR Impedance Control Settings table in the Control Module Functional Description section for a definition of these bits.
4-3	io_config_sr	R/W	0h	2 bit to program addr/cmd IO Pads output slew rate. These connect as SR1, SR0 to the corresponding DDR IO buffer. See the DDR Slew Rate Control Settings table in the Control Module Functional Description section for a definition of these bits.

**Table 9-99. ddr\_cmd1\_ioctrl Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
2-0	io_config_i	R/W	0h	3-bit configuration input to program addr/cmd IO output impedance. These connect as I2, I1, I0 to the corresponding DDR IO buffer. See the DDR Impedance Control Settings table in the Control Module Functional Description section for a definition of these bits.

### 9.3.90 ddr\_cmd2\_ioctrl Register (offset = 140Ch) [reset = 0h]

ddr\_cmd2\_ioctrl is shown in Figure 9-93 and described in Table 9-100.

**Figure 9-93. ddr\_cmd2\_ioctrl Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-100. ddr\_cmd2\_ioctrl Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-21	io_config_gp_wd1	R/W	0h	There are 2 bits per IO: io_config_gp_wd1 and io_config_gp_wd0. For example: macro pin 0: WD1 is bit 21, WD0 is bit 10 macro pin 1: WD1 is bit 22, WD0 is bit 11 ... macro pin 10: WD1 is bit 31, WD0 is bit 20 See the DDR PHY to IO Pin Mapping table in the Control Module Functional Description section for a mapping of macro bits to I/Os. WD1:WD0 00: Pullup/Pulldown disabled 01: Weak pullup enabled 10: Weak pulldown enabled 11: Weak keeper enabled
20-10	io_config_gp_wd0	R/W	0h	There are 2 bits per IO: io_config_gp_wd1 and io_config_gp_wd0. For example: macro pin 0: WD1 is bit 21, WD0 is bit 10 macro pin 1: WD1 is bit 22, WD0 is bit 11 ... macro pin 10: WD1 is bit 31, WD0 is bit 20 See the DDR PHY to IO Pin Mapping table in the Control Module Functional Description section for a mapping of macro bits to I/Os. WD1:WD0 00: Pullup/Pulldown disabled 01: Weak pullup enabled 10: Weak pulldown enabled 11: Weak keeper enabled
9-8	io_config_sr_clk	R/W	0h	2 bit to program clock IO Pads (DDR_CK/DDR_CKN) output slew rate. These connect as SR1, SR0 to the corresponding DDR IO buffer. See the DDR Slew Rate Control Settings table in the Control Module Functional Description section for a definition of these bits.
7-5	io_config_i_clk	R/W	0h	3-bit configuration input to program clock IO pads (DDR_CK/DDR_CKN) output impedance. These connect as I2, I1, I0 to the corresponding DDR IO buffer. See the DDR Impedance Control Settings table in the Control Module Functional Description section for a definition of these bits.
4-3	io_config_sr	R/W	0h	2 bit to program addr/cmd IO Pads output slew rate. These connect as SR1, SR0 to the corresponding DDR IO buffer. See the DDR Slew Rate Control Settings table in the Control Module Functional Description section for a definition of these bits.

**Table 9-100. ddr\_cmd2\_ioctrl Register Field Descriptions (continued)**

<b>Bit</b>	<b>Field</b>	<b>Type</b>	<b>Reset</b>	<b>Description</b>
2-0	io_config_i	R/W	0h	3-bit configuration input to program addr/cmd IO output impedance. These connect as I2, I1, I0 to the corresponding DDR IO buffer. See the DDR Impedance Control Settings table in the Control Module Functional Description section for a definition of these bits.

### 9.3.91 ddr\_data0\_ioctrl Register (offset = 1440h) [reset = 0h]

ddr\_data0\_ioctrl is shown in [Figure 9-94](#) and described in [Table 9-101](#).

**Figure 9-94. ddr\_data0\_ioctrl Register**

17-10	io_config_wd0_dq	R/W	0h	Input that selects pullup or pulldown for DQ. There are 2 bits per IO: io_config_wd1_dq and io_config_wd0_dq. For example: macro pin 0: WD1 is bit 20, WD0 is bit 10 macro pin 1: WD1 is bit 21, WD0 is bit 11 ... macro pin 7: WD1 is bit 27, WD0 is bit 17 See the DDR PHY to IO Pin Mapping table in the Control Module Functional Description section for a mapping of macro bits to I/Os. WD1:WD0 00: Pullup/Pulldown disabled 01: Weak pullup enabled 10: Weak pulldown enabled 11: Weak keeper enabled
9-8	io_config_sr_clk	R/W	0h	2 bit to program clock IO Pads (DDR_DQS/DDR_DQSn) output slew rate. These connect as SR1, SR0 of the corresponding IO buffer. See the DDR Slew Rate Control Settings table in the Control Module Functional Description section for a definition of these bits.
7-5	io_config_i_clk	R/W	0h	3-bit configuration input to program clock IO pads (DDR_DQS/DDR_DQSn) output impedance. These connect as I2, I1, I0 of the corresponding buffer. See the DDR Impedance Control Settings table in the Control Module Functional Description section for a definition of these bits.
4-3	io_config_sr	R/W	0h	2 bit to program data IO Pads output slew rate. These connect as SR1, SR0 of the corresponding IO buffer. See the DDR Slew Rate Control Settings table in the Control Module Functional Description section for a definition of these bits.
2-0	io_config_i	R/W	0h	3-bit configuration input to program data IO output impedance. These connect as I2, I1, I0 of the corresponding IO buffer. See the DDR Impedance Control Settings table in the Control Module Functional Description section for a definition of these bits.

## **Interconnects**

---

---

---

This chapter describes the interconnects of the device.

Topic	Page
<b>10.1 Introduction .....</b>	<b>864</b>

## 10.1 Introduction

The system interconnect is based on a 2-level hierarchical architecture (L3, L4) driven by system performance. The L4 interconnect is based on a fully native OCP infrastructure, directly complying with the OCPIP2.2 reference standard.

### 10.1.1 Terminology

The following is a brief explanation of some terms used in this document:

**Initiator:** Module able to initiate read and write requests to the chip interconnect (typically: processors, DMA, etc.).

**Target:** Unlike an initiator, a target module cannot generate read/write requests to the chip interconnect, but it can respond to these requests. However, it may generate interrupts or a DMA request to the system (typically: peripherals, memory controllers). **Note:** A module can have several separate ports; therefore, a module can be an initiator and a target.

**Agent:** Each connection of one module to one interconnect is done using an agent, which is an adaptation (sometimes configurable) between the module and the interconnect. A target module is connected by a target agent (TA), and an initiator module is connected by an initiator agent (IA).

**Interconnect:** The decoding, routing, and arbitration logic that enable the connection between multiple initiator modules and multiple target modules connected on it.

**Register Target (RT):** Special TA used to access the interconnect internal configuration registers.

**Data-flow Signal:** Any signal that is part of a clearly identified transfer or data flow (typically: command, address, byte enables, etc.). Signal behavior is defined by the protocol semantics.

**Sideband Signal:** Any signal whose behavior is not associated to a precise transaction or data flow.

**Command Slot:** A command slot is a subset of the command list. It is the memory buffer for a single command. A total of 32 command slots exist.

**Out-of-band Error:** Any signal whose behavior is associated to a device error-reporting scheme, as opposed to in-band errors. Note: Interrupt requests and DMA requests are not routed by the interconnect in the device.

**ConnID:** Any transaction in the system interconnect is tagged by an in-band qualifier ConnID, which uniquely identifies the initiator at a given interconnect point. A ConnID is transmitted in band with the request and is used for error-logging mechanism.

### 10.1.2 L3 Interconnect

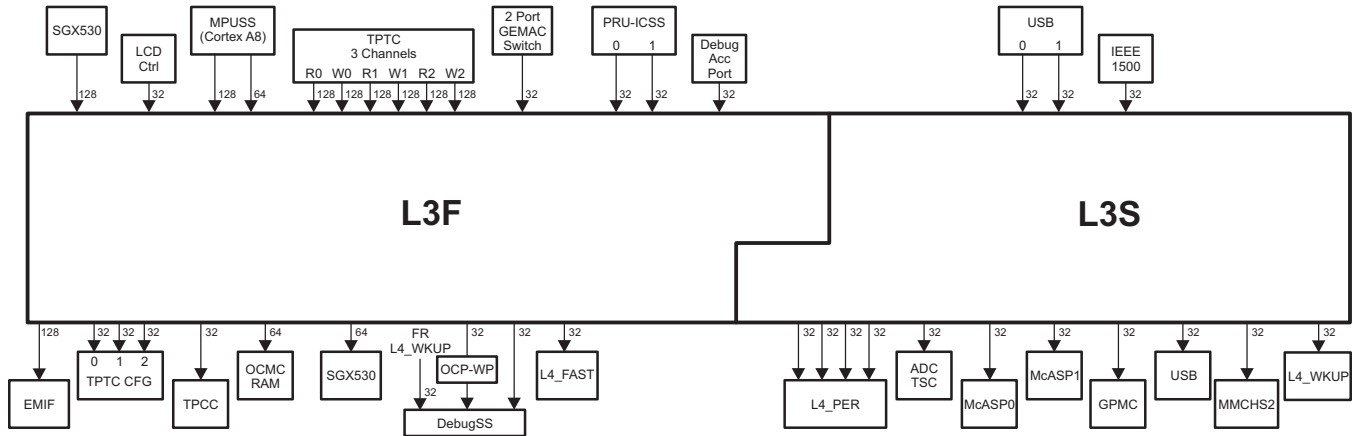

The L3 high-performance interconnect is based on a Network-On-Chip (NoC) interconnect infrastructure. The NoC uses an internal packet-based protocol for forward (read command, write command with data payload) and backward (read response with data payload, write response) transactions. All exposed interfaces of this NoC interconnect, both for Targets and Initiators; comply with the OCPIP2.2 reference standard.

#### 10.1.2.1 L3 Topology

The L3 topology is driven by performance requirements, bus types, and clocking structure. The main L3 paths are shown in [Figure 10-1](#). Arrows indicate the master/slave relationship not data flow. L3 is partitioned into two separate clock domains: L3F corresponds to L3 Fast clock domain and L3S corresponds to L3 Slow clock domain.

Figure 10-1. L3 Topology

### 10.1.2.2 L3 Port Mapping

Each initiator and target core is connected to the L3 interconnect through a Network Interface Unit (NIU). The NIUs act as entry and exit points to the L3 Network on Chip – converting between the IP's OCP protocol and the NoC's internal protocol, and also include various programming registers. All ports are single threaded with tags used to enable pipelined transactions. The interconnect includes:

#### Initiator Ports:

- L3F
  - Cortex A8 MPUSS 128-bit initiator port0 and 64-bit initiator port1
  - SGX530 128-bit initiator port
  - 3 TPTC 128-bit read initiator ports
  - 3 TPTC 128-bit write initiator ports
  - LCDC 32-bit initiator port
  - 2 PRU-ICSS1 32-bit initiator ports
  - 2 port Gigabit Ethernet Switch (2PGSW) 32-bit initiator port
  - Debug Subsystem 32-bit initiator port
- L3S
  - USB 32-bit CPPI DMA initiator port
  - USB 32-bit Queue Manager initiator port
  - P1500 32-bit initiator port

#### Target Ports:

- L3F
  - EMIF 128-bit target port
  - 3 TPTC CFG 32-bit target ports
  - TPCC CFG 32-bit target port
  - OCM RAM0 64-bit target port
  - DebugSS 32-bit target port
  - SGX530 64-bit target port
  - L4\_FAST 32-bit target port
- L3S
  - 4 L4\_PER peripheral 32-bit target ports
  - GPMC 32-bit target port
  - McASP0 32-bit target port

- McASP1 32-bit target port
- ADC\_TSC 32-bit target port
- USB 32-bit target port
- MMHCS2 32-bit target port
- L4\_WKUP wakeup 32-bit target port

### 10.1.2.3 Interconnect Requirements

The required L3 connections between bus masters and slave ports are shown in [Table 10-1](#). The L3 interconnect will return an address-hole error if any initiator attempts to access a target to which it has no connection.

**Table 10-1. L3 Master — Slave Connectivity**

Master ID	Masters	Slaves																		
		EMIF	OCMC-RAM	TPTC0-2 FG	TPTC	SGX530	Expansion Slot	L4_Fast	L4_PER Port0	L4_PER Port1	L4_PER Port 2	L4_PER Port 3	GPMC	ADC / TSC	USBCFG	MMCHS2	L4_WKUP	L4_FW	DebugSS	NOC Registers

### 10.1.2.4 ConnID Assignment

Each L3 initiator includes a unique 6-bit master connection identifier (MConnID) that is used to identify the source of a transfer request. Since AM335x contains more than 16 unique masters some masters will appear identical to target firewalls.

**Table 10-2. MConnID Assignment**

Initiator	6-bit MConnID (Debug)	Instrumentation	Comment
MPUSS M1 (128-bit)	0x00	0	Connects only to EMIF
MPUSS M2 (64-bit)	0x01	SW	
DAP	0x04	SW	
P1500	0x05	SW	
PRU-ICSS (PRU0)	0x0E	SW	
PRU-ICSS (PRU1)	0x0F	SW	
Wakeup M3	0x14	SW	Connects only to L4_WKUP
TPTC0 Read	0x18	0	
TPTC0 Write	0x19	SW	One WR port for data logging
TPTC1 Read	0x1A	0	
TPTC1 Write	0x1B	0	
TPTC2 Read	0x1C	0	
TPTC2 Write	0x1D	0	
SGX530	0x20	0	
OCP WP Traffic Probe	0x21 <sup>(1)</sup>	HW	Direct connect to DebugSS
OCP WP DMA Profiling	0x22 <sup>(1)</sup>	HW	Direct connect to DebugSS
OCP-WP Event Trace	0x23 <sup>(1)</sup>	HW	Direct connect to DebugSS
LCD Ctrl	0x24	0	
GEMAC	0x30	0	
USB DMA	0x34	0	
USB QMGR	0x35	0	
Stat Collector 0	0x3C	HW	
Stat Collector 1	0x3D	HW	
Stat Collector 2	0x3E	HW	
Stat Collector 3	0x3F	HW	

<sup>(1)</sup> These MConnIDs are generated within the OCP-WP module based on the H0, H1, and H2 configuration parameters.

---

**NOTE:** Instrumentation refers to debug type. SW instrumentation means that the master can write data to be logged to the STM (similar to a printf()). HW indicates debug data captured automatically by hardware. A '0' entry indicates no debug capability.

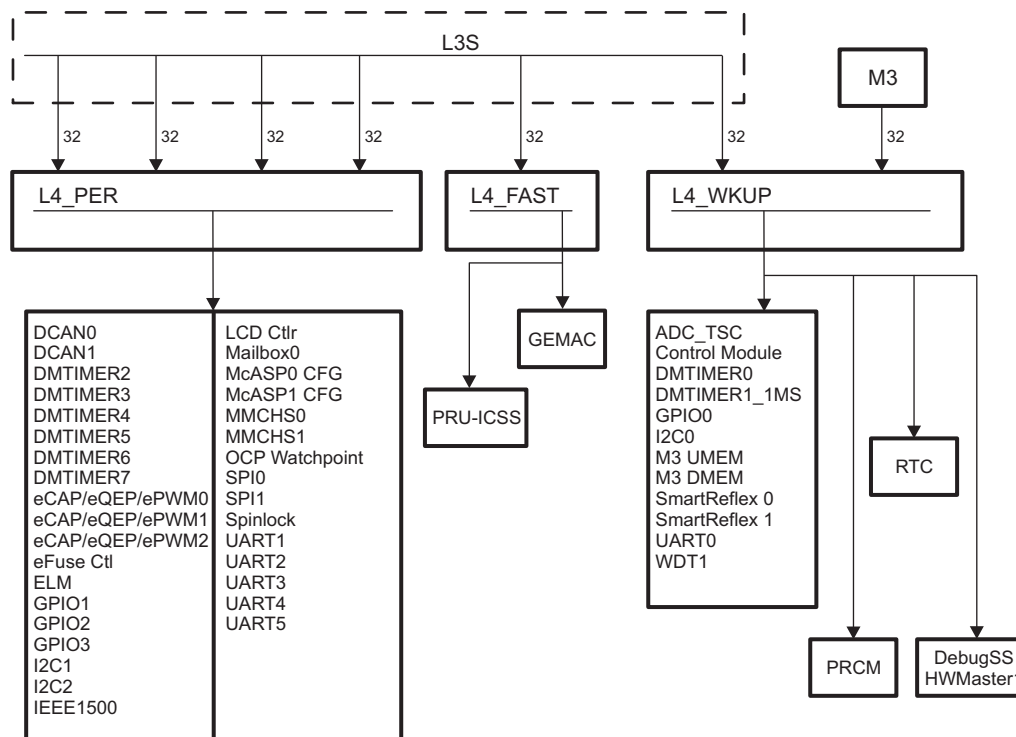

---

### 10.1.3 L4 Interconnect

The L4 interconnect is a non-blocking peripheral interconnect that provides low latency access to a large number of low bandwidth, physically dispersed target cores. The L4 can handle incoming traffic from up to four initiators and can distribute those communication requests to and collect related responses from up to 63 targets.

This device provides three interfaces with L3 interconnect for High Speed Peripheral, Standard Peripheral, and Wakeup Peripherals. . [Figure 10-2](#) shows the L4 bus architecture and memory-mapped peripherals.

**Figure 10-2. L4 Topology**

## ***Enhanced Direct Memory Access (EDMA)***

---

---

This chapter describes the EDMA of the device.

<b>Topic</b>	<b>Page</b>
<b>11.1 Introduction</b> .....	<b>870</b>
<b>11.2 Integration</b> .....	<b>873</b>
<b>11.3 Functional Description</b> .....	<b>876</b>
<b>11.4 EDMA3 Registers</b> .....	<b>939</b>
<b>11.5 Appendix A</b> .....	<b>1018</b>

## 11.1 Introduction

The enhanced direct memory access (EDMA3) controller's primary purpose is to service user-programmed data transfers between two memory-mapped slave endpoints on the device.

Typical usage includes, but is not limited to the following:

- Servicing software-driven paging transfers (e.g., transfers from external memory, such as DDR2 to internal device memory).
- Servicing event-driven peripherals, such as a serial port.
- Performing sorting or sub-frame extraction of various data structures.
- Offloading data transfers from the main device CPU(s).

The EDMA3 controller consists of two principal blocks:

- EDMA3 channel controller (EDMA3CC).
- EDMA3 transfer controller(s) (EDMA3TC).

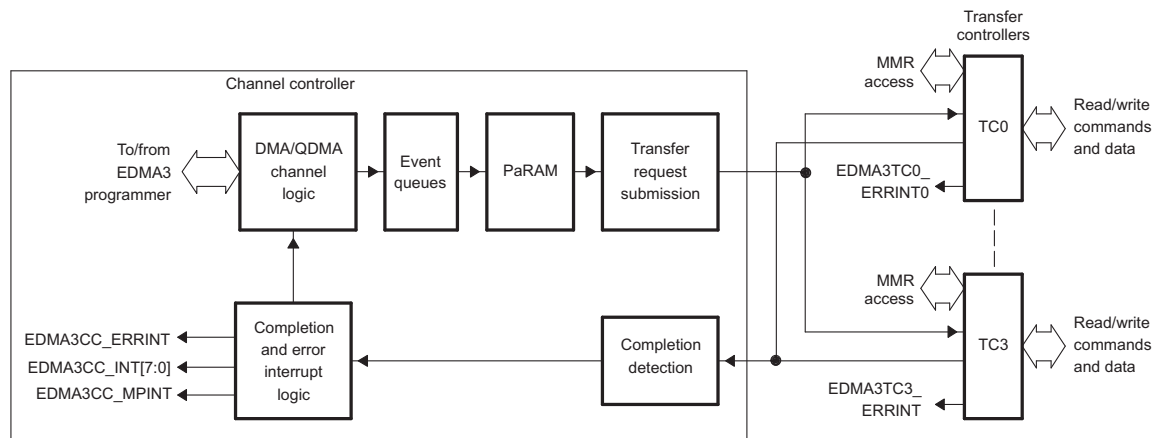

The EDMA3 channel controller serves as the user interface for the EDMA3 controller. The EDMA3CC includes parameter RAM (PaRAM), channel control registers, and interrupt control registers. The EDMA3CC serves to prioritize incoming software requests or events from peripherals and submits transfer requests (TRs) to the transfer controller.

The EDMA3 transfer controllers are slaves to the EDMA3 channel controller that is responsible for data movement. The transfer controller issues read/write commands to the source and destination addresses that are programmed for a given transfer. The operation is transparent to user.

### 11.1.1 EDMA3 Controller Block Diagram

Figure 11-1 shows a block diagram for the EDMA3 controller.

**Figure 11-1. EDMA3 Controller Block Diagram**

### 11.1.2 Third-Party Channel Controller (TPCC) Overview

#### 11.1.2.1 TPCC Features

The general features of the TPCC module are:

- Up to 64 DMA Channels
  - Channels triggered by:
    - Event Synchronization
    - Manual Synchronization (CPU write to 'Event Set Register')
    - Chain Synchronization (completion of one transfer chains to the next)
  - Parameterizable support for programmable DMA Channel to PaRAM mapping

- Up to 8 QDMA Channels
  - QDMA Channels are triggered automatically upon writing to PaRAM
  - Support for programmable QDMA Channel to PaRAM mapping
- Up to 64 Event Inputs
- Up to 8 Interrupt outputs for multi-core support
- Up to 256 PaRAM entries
  - Each PaRAM entry can be used as DMA Entry (up to 64), QDMA Entry (up to 8), or Link Entry (remaining)
- 8 Priority Levels for mapping CC/TC priority relative to priority of other masters in the system.
- Up to 8 Event Queues
- 16 Event Entries per Event Queue
- Supports three-transfer dimensions
  - A-synchronized transfers—one dimension serviced per event
  - AB-synchronized transfers—two dimensions serviced per event
  - Independent Indexes on Source and Destination
  - Does not support direct submission of 3D transfer to TC
  - Chaining feature allows 3D transfer based on single event
- Increment and FIFO transfer addressing modes (TC feature)
- Linking mechanism allows automatic PaRAM Entry update
- Transfer Completion Signaling between TC and CC for Chaining and Interrupt generation.
- Programmable assignment of Priority to TC channel.
- Proxied Memory Protection for TR submission
- Parameterizable support for Active Memory Protection for accesses to PaRAM and registers.
- Queue Watermarking
- Missed Event Detection
- Error and status recording to facilitate debug
- Single Clock domain for all interfaces
- Parameterizable number of Write Completion interfaces (up to 8) (set to number of TC Channels)
- AET Event generation

#### 11.1.2.2 Unsupported TPCC Features

This device does not support AET event generation because output is not connected.

### 11.1.3 Third-Party Transfer Controller (TPTC) Overview

#### 11.1.3.1 TPTC Features

The TPTC module includes the following features:

- Up to eight independent channels
- External event control use model (TPCC)
- Read and Write Master ports per Channel 64- or 128-bit configuration.
- Parameterizable FIFO size
- Up to four in-flight Transfer Requests
- Proxied Memory protection for data transfers
- Programmable Priority levels (up to 8)
- Background programming capability
- Supports 2-dimensional transfers with independent indexes on Source and Destination.

- Support for increment or FIFO-mode transfers
- Interrupt and error support
- Single clock domain for all interfaces

### 11.1.3.2 Unsupported TPTC Features

There are no unsupported TPTC features on this device.

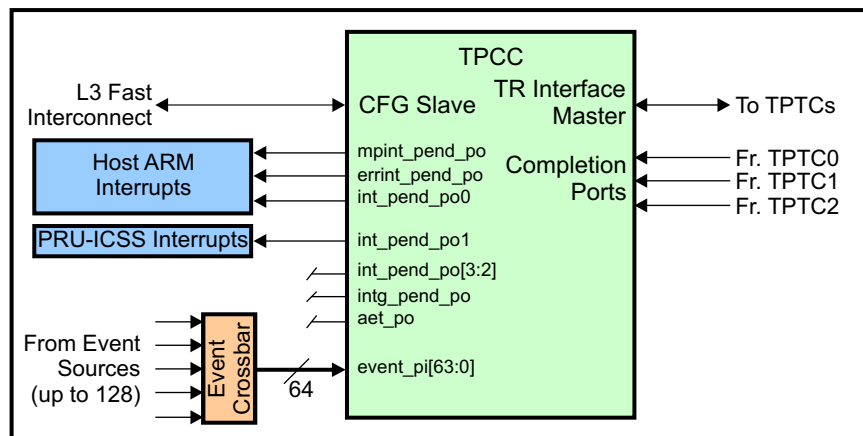

## 11.2 Integration

### 11.2.1 Third-Party Channel Controller (TPCC) Integration

This device uses the TPCC peripheral to provide control over its third-party transfer channels (TPTCs). Figure 11-2 shows the integration of the TPCC module.

Figure 11-2. TPCC Integration

#### 11.2.1.1 TPCC Connectivity Attributes

The general connectivity attributes of the TPCC are summarized in Table 11-1.

Table 11-1. TPCC Connectivity Attributes

Attributes	Type
Power domain	Peripheral Domain
Clock domain	PD_PER_L3_GCLK
Reset signals	PER_DOM_RST_N
Idle/Wakeup signals	Smart Idle
Interrupt request	4 Regional Completion Interrupts: int_pend_po0 (EDMACOMPINT) – to MPU Subsystem int_pend_po1 (tpcc_int_pend_po1) – to PRU-ICSS Int_pend_po[3:2] - unused Error Interrupt: errint_po (EDMAERRINT) – to MPU Subsystem Memory Protection Error Interrupt: mpint_p0 (EDMAMPERR) – to MPU Subsystem
DMA request	none
Physical address	L3 Fast slave port

#### 11.2.1.2 TPCC Clock and Reset Management

The TPCC operates from a single clock and runs at the L3\_Fast clock rate.

Table 11-2. TPCC Clock Signals

Clock Signal	Max Freq	Reference / Source	Comments
tpcc_clk_pi Interface / Functional clock	200 MHz	CORE_CLKOUTM4	pd_per_l3_gclk From PRCM

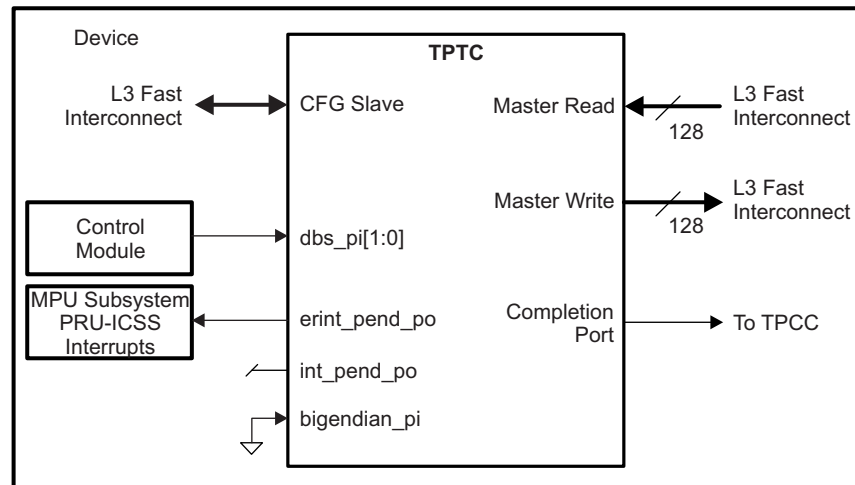

### 11.2.1.3 TPCC Pin List

The TPCC module does not include any external interface pins.

## 11.2.2 Third-Party Transfer Controller (TPTC) Integration

This device uses the three TPTC peripherals (TC0–TC2; TC3 is not supported) to perform EDMA transfers between slave peripherals. The submission of transfer requests to the TPTCs is controlled by the TPCC. [Figure 11-3](#) shows the integration of the TPTC modules

**Figure 11-3. TPTC Integration**

### 11.2.2.1 TPTC Connectivity Attributes

The general connectivity attributes for the TPTCs are shown in [Table 11-3](#).

**Table 11-3. TPTC Connectivity Attributes**

Attributes	Type
Power domain	Peripheral Domain
Clock domain	PD_PER_L3_GCLK
Reset signals	PER_DOM_RST_N
Idle/Wakeup signals	Standby Smart Idle
Interrupt request	Error interrupt per instance erint_pend_po (TCERRINTx) – to MPU Subsystem and PRU-ICSS (tpc_erint_pend_po, TPTC0 only)
DMA request	none
Physical address	L3 Fast slave port

### 11.2.2.2 TPTC Clock and Reset Management

The TPTC operates from a single clock and runs at the L3\_Fast clock rate.

**Table 11-4. TPTC Clock Signals**

Clock Signal	Max Freq	Reference / Source	Comments
tpc_clk_pi Interface / Functional clock	200 MHz	CORE_CLKOUTM4	pd_per_l3_gclk From PRCM

**11.2.2.3 TPTC Pin List**

The TPTC module does not include any external interface pins.

## 11.3 Functional Description

This chapter discusses the architecture of the EDMA3 controller.

### 11.3.1 Functional Overview

#### 11.3.1.1 EDMA3 Channel Controller (EDMA3CC)

[Figure 11-4](#) shows a functional block diagram of the EDMA3 channel controller (EDMA3CC).

The main blocks of the EDMA3CC are as follows:

- **Parameter RAM (PaRAM):** The PaRAM maintains parameter sets for channel and reload parameter sets. You must write the PaRAM with the transfer context for the desired channels and link parameter sets. EDMA3CC processes sets based on a trigger event and submits a transfer request (TR) to the transfer controller.
- **EDMA3 event and interrupt processing registers:** Allows mapping of events to parameter sets, enable/disable events, enable/disable interrupt conditions, and clearing interrupts.
- **Completion detection:** The completion detect block detects completion of transfers by the EDMA3TC and/or slave peripherals. You can optionally use completion of transfers to chain trigger new transfers or to assert interrupts.
- **Event queues:** Event queues form the interface between the event detection logic and the transfer request submission logic.
- **Memory protection registers:** Memory protection registers define the accesses (privilege level and requestor(s)) that are allowed to access the DMA channel shadow region view(s) and regions of PaRAM.

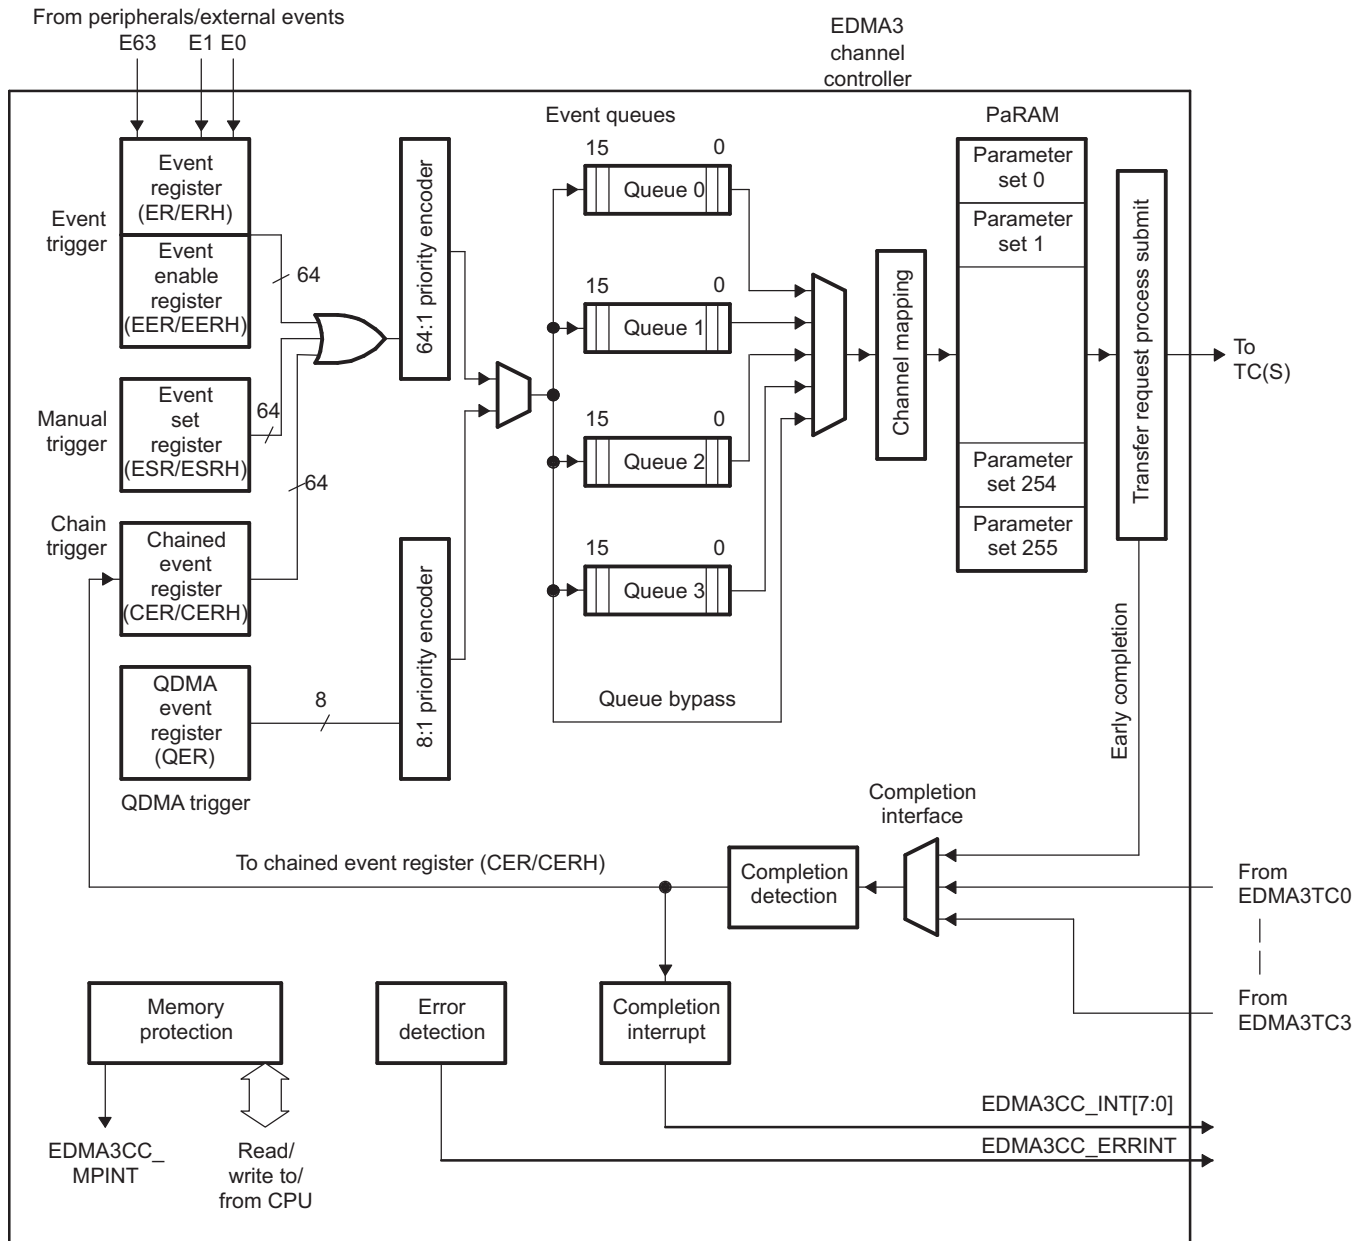

Other functions include the following:

- **Region registers:** Region registers allow DMA resources (DMA channels and interrupts) to be assigned to unique regions that different EDMA3 programmers own (for example, ARM).
- **Debug registers:** Debug registers allow debug visibility by providing registers to read the queue status, controller status, and missed event status.

The EDMA3CC includes two channel types: DMA channels (64 channels) and QDMA channels (8 channels).

Each channel is associated with a given event queue/transfer controller and with a given PaRAM set. The main thing that differentiates a DMA channel from a QDMA channel is the method that the system uses to trigger transfers. See [Section 11.3.4](#).

Figure 11-4. EDMA3 Channel Controller (EDMA3CC) Block Diagram

A trigger event is needed to initiate a transfer. A trigger event may be due to an external event, manual write to the event set register, or chained event for DMA channels. QDMA channels auto-trigger when a write to the trigger word that you program occurs on the associated PaRAM set. All such trigger events are logged into appropriate registers upon recognition.

Once a trigger event is recognized, the appropriate event gets queued in the EDMA3CC event queue. The assignment of each DMA/QDMA channel to an event queue is programmable. Each queue is 16 events deep; therefore, you can queue up to 16 events (on a single queue) in the EDMA3CC at a time. Additional pending events that are mapped to a full queue are queued when the event queue space becomes available. See [Section 11.3.11](#).

If events on different channels are detected simultaneously, the events are queued based on a fixed priority arbitration scheme with the DMA channels being higher priority events than the QDMA channels. Among the two groups of channels, the lowest-numbered channel is the highest priority.

Each event in the event queue is processed in FIFO order. When the head of the queue is reached, the PaRAM associated with that channel is read to determine the transfer details. The TR submission logic evaluates the validity of the TR and is responsible for submitting a valid transfer request (TR) to the appropriate EDMA3TC (based on the event queue to the EDMA3TC association, Q0 goes to TC0, Q1 goes to TC1, Q2 goes to TC2, and Q3 goes to TC3). For more information, refer to [Section 11.3.3](#).

The EDMA3TC receives the request and is responsible for data movement, as specified in the transfer request packet (TRP), other necessary tasks like buffering, and ensuring transfers are carried out in an optimal fashion wherever possible. For more information on EDMA3TC, refer to [Section 11.3.1.2](#).

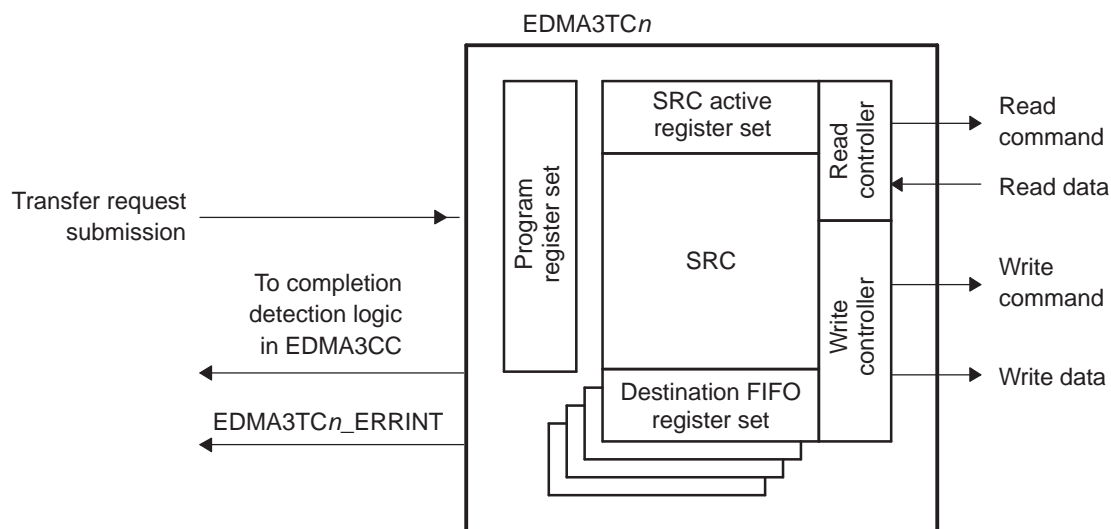

If you have decided to receive an interrupt or to chain to another channel on completion of the current transfer, the EDMA3TC signals completion to the EDMA3CC completion detection logic when the transfer is complete. You can alternately choose to trigger completion when a TR leaves the EDMA3CC boundary, rather than wait for all of the data transfers to complete. Based on the setting of the EDMA3CC interrupt registers, the completion interrupt generation logic is responsible for generating EDMA3CC completion interrupts to the CPU. For more information, refer to [Section 11.3.5](#).

Additionally, the EDMA3CC also has an error detection logic that causes an error interrupt generation on various error conditions (like missed events, exceeding event queue thresholds, etc.). For more information on error interrupts, refer to [Section 11.3.9.4](#).

### 11.3.1.2 EDMA3 Transfer Controller (EDMA3TC)

[Section 11.3.9.4](#) shows a functional block diagram of the EDMA3 transfer controller (EDMA3TC).

**Figure 11-5. EDMA3 Transfer Controller (EDMA3TC) Block Diagram**

The main blocks of the EDMA3TC are:

- **DMA program register set:** The DMA program register set stores the transfer requests received from the EDMA3 channel controller (EDMA3CC).
- **DMA source active register set:** The DMA source active register set stores the context for the DMA transfer request currently in progress in the read controller.
- **Read controller:** The read controller issues read commands to the source address.
- **Destination FIFO register set:** The destination (DST) FIFO register set stores the context for the DMA transfer request(s) currently in progress in the write controller.
- **Write controller:** The write controller issues write commands/write data to the destination slave.
- **Data FIFO:** The data FIFO exists for holding temporary in-flight data.
- **Completion interface:** The completion interface sends completion codes to the EDMA3CC when a transfer completes, and generates interrupts and chained events (also, see [Section 11.3.1.1](#) for more information on transfer completion reporting).

When the EDMA3TC is idle and receives its first TR, DMA program register set receives the TR, where it transitions to the DMA source active set and the destination FIFO register set immediately. The second TR (if pending from EDMA3CC) is loaded into the DMA program set, ensuring it can start as soon as possible when the active transfer completes. As soon as the current active set is exhausted, the TR is loaded from the DMA program register set into the DMA source active register set as well as to the appropriate entry in the destination FIFO register set.

The read controller issues read commands governed by the rules of command fragmentation and optimization. These are issued only when the data FIFO has space available for the data read. When sufficient data is in the data FIFO, the write controller starts issuing a write command again following the rules for command fragmentation and optimization. For more information on command fragmentation and optimization, refer to [Section 11.3.12.1.1](#).

Depending on the number of entries, the read controller can process up to two or four transfer requests ahead of the destination subject to the amount of free data FIFO.

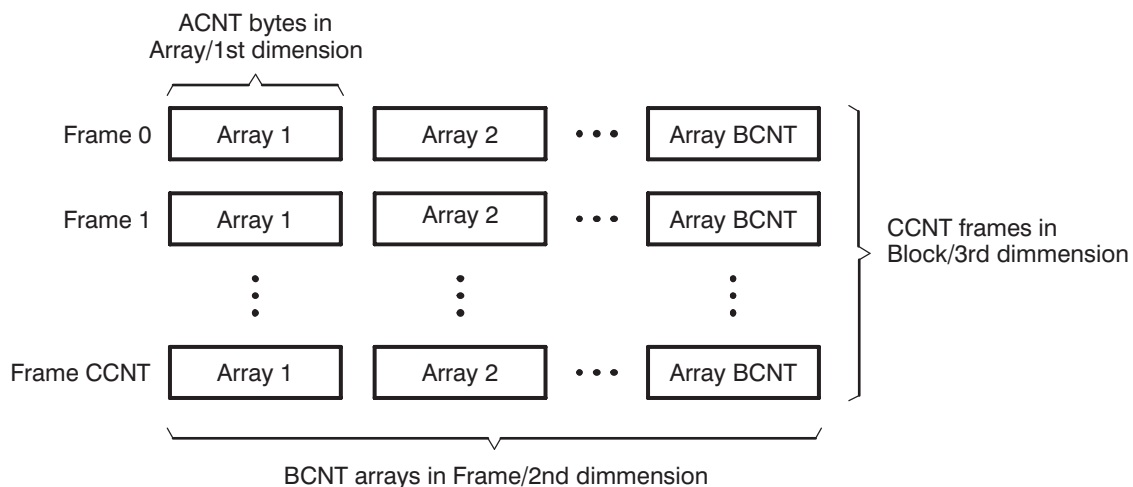

### 11.3.2 Types of EDMA3 Transfers

An EDMA3 transfer is always defined in terms of three dimensions. [Figure 11-6](#) shows the three dimensions used by EDMA3 transfers. These three dimensions are defined as:

- 1st Dimension or Array (A): The 1st dimension in a transfer consists of ACNT contiguous bytes.
- 2nd Dimension or Frame (B): The 2nd dimension in a transfer consists of BCNT arrays of ACNT bytes. Each array transfer in the 2nd dimension is separated from each other by an index programmed using SRCBIDX or DSTBIDX.
- 3rd Dimension or Block (C): The 3rd dimension in a transfer consists of CCNT frames of BCNT arrays of ACNT bytes. Each transfer in the 3rd dimension is separated from the previous by an index programmed using SRCCIDX or DSTCIDX.

Note that the reference point for the index depends on the synchronization type. The amount of data transferred upon receipt of a trigger/synchronization event is controlled by the synchronization types (SYNCDIM bit in OPT). Of the three dimensions, only two synchronization types are supported: A-synchronized transfers and AB-synchronized transfers.

**Figure 11-6. Definition of ACNT, BCNT, and CCNT**

### 11.3.2.1 A-Synchronized Transfers

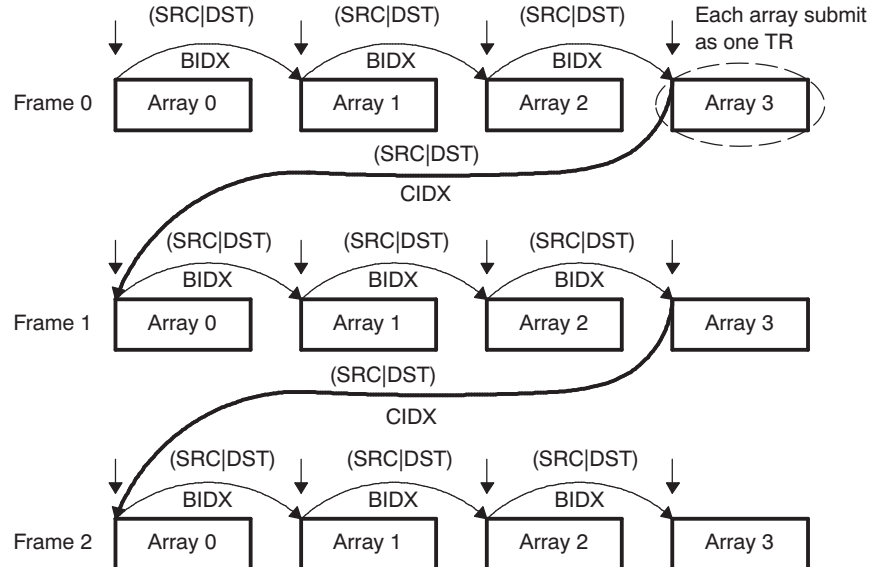

In an A-synchronized transfer, each EDMA3 sync event initiates the transfer of the 1st dimension of ACNT bytes, or one array of ACNT bytes. In other words, each event/TR packet conveys the transfer information for one array only. Thus, BCNT × CCNT events are needed to completely service a PaRAM set.

Arrays are always separated by SRCBIDX and DSTBIDX, as shown in Figure 11-7, where the start address of Array N is equal to the start address of Array N – 1 plus source (SRC) or destination (DST) BIDX.

Frames are always separated by SRCCIDX and DSTCIDX. For A-synchronized transfers, after the frame is exhausted, the address is updated by adding SRCCIDX/DSTCIDX to the beginning address of the last array in the frame. As in Figure 11-7, SRCCIDX/DSTCIDX is the difference between the start of Frame 0 Array 3 to the start of Frame 1 Array 0.

Figure 11-7 shows an A-synchronized transfer of 3 (CCNT) frames of 4 (BCNT) arrays of n (ACNT) bytes. In this example, a total of 12 sync events (BCNT × CCNT) exhaust a PaRAM set. See Section 11.3.3.6 for details on parameter set updates.

**Figure 11-7. A-Synchronized Transfers (ACNT = n, BCNT = 4, CCNT = 3)**

### 11.3.2.2 AB-Synchronized Transfers

In a AB-synchronized transfer, each EDMA3 sync event initiates the transfer of 2 dimensions or one frame. In other words, each event/TR packet conveys information for one entire frame of BCNT arrays of ACNT bytes. Thus, CCNT events are needed to completely service a PaRAM set.

Arrays are always separated by SRCBIDX and DSTBIDX as shown in Figure 11-8. Frames are always separated by SRCCIDX and DSTCIDX.

Note that for AB-synchronized transfers, after a TR for the frame is submitted, the address update is to add SRCCIDX/DSTCIDX to the beginning address of the beginning array in the frame. This is different from A-synchronized transfers where the address is updated by adding SRCCIDX/DSTCIDX to the start address of the last array in the frame. See Section 11.3.3.6 for details on parameter set updates.

Figure 11-8 shows an AB-synchronized transfer of 3 (CCNT) frames of 4 (BCNT) arrays of *n* (ACNT) bytes. In this example, a total of 3 sync events (CCNT) exhaust a PaRAM set; that is, a total of 3 transfers of 4 arrays each completes the transfer.

**Figure 11-8. AB-Synchronized Transfers (ACNT = n, BCNT = 4, CCNT = 3)**

**NOTE:** ABC-synchronized transfers are not directly supported. But can be logically achieved by chaining between multiple AB-synchronized transfers.

### 11.3.3 Parameter RAM (PaRAM)

The EDMA3 controller is a RAM-based architecture. The transfer context (source/destination addresses, count, indexes, etc.) for DMA or QDMA channels is programmed in a parameter RAM table within EDMA3CC, referred to as PaRAM. The PaRAM table is segmented into multiple PaRAM sets. Each PaRAM set includes eight four-byte PaRAM set entries (32-bytes total per PaRAM set), which includes typical DMA transfer parameters such as source address, destination address, transfer counts, indexes, options, etc.

The PaRAM structure supports flexible ping-pong, circular buffering, channel chaining, and auto-reloading (linking).

The contents of the PaRAM include the following:

- 256 PaRAM sets
- 64 channels that are direct mapped and can be used as link or QDMA sets if not used for DMA channels
- 64 channels remain for link or QDMA sets

By default, all channels map to PaRAM set to 0. These should be remapped before use. For more information, see [Section 11.4.1.1.4](#) (DCHMAP registers) and [Section 11.4.1.1.5](#) (QCHMAP registers).

**Table 11-5. EDMA3 Parameter RAM Contents**

PaRAM Set Number	Address	Parameters
0	EDMA Base Address + 4000h to EDMA Base Address + 401Fh	PaRAM set 0
1	EDMA Base Address + 4020h to EDMA Base Address + 403Fh	PaRAM set 1
2	EDMA Base Address + 4040h to EDMA Base Address + 405Fh	PaRAM set 2
3	EDMA Base Address + 4060h to EDMA Base Address + 407Fh	PaRAM set 3
4	EDMA Base Address + 4080h to EDMA Base Address + 409Fh	PaRAM set 4
5	EDMA Base Address + 40A0h to EDMA Base Address + 40BFh	PaRAM set 5
6	EDMA Base Address + 40C0h to EDMA Base Address + 40DFh	PaRAM set 6
7	EDMA Base Address + 40E0h to EDMA Base Address + 40FFh	PaRAM set 7
8	EDMA Base Address + 4100h to EDMA Base Address + 411Fh	PaRAM set 8
9	EDMA Base Address + 4120h to EDMA Base Address + 413Fh	PaRAM set 9
...	...	...
63	EDMA Base Address + 47E0h to EDMA Base Address + 47FFh	PaRAM set 63
64	EDMA Base Address + 4800h to EDMA Base Address + 481Fh	PaRAM set 64
65	EDMA Base Address + 4820h to EDMA Base Address + 483Fh	PaRAM set 65
...	...	...
254	EDMA Base Address + 5FC0h to EDMA Base Address + 5FDFh	PaRAM set 254
255	EDMA Base Address + 5FE0h to EDMA Base Address + 5FFFh	PaRAM set 255

### 11.3.3.1 PaRAM

Each parameter set of PaRAM is organized into eight 32-bit words or 32 bytes, as shown in [Figure 11-9](#) and described in [Table 11-6](#). Each PaRAM set consists of 16-bit and 32-bit parameters.

**Figure 11-9. PaRAM Set**

**Table 11-6. EDMA3 Channel Parameter Description**

Offset Address (bytes)	Acronym	Parameter	Description
0h	OPT	Channel Options	Transfer configuration options
4h	SRC	Channel Source Address	The byte address from which data is transferred
8h <sup>(1)</sup>	ACNT	Count for 1st Dimension	Unsigned value specifying the number of contiguous bytes within an array (first dimension of the transfer). Valid values range from 1 to 65 535.
	BCNT	Count for 2nd Dimension	Unsigned value specifying the number of arrays in a frame, where an array is ACNT bytes. Valid values range from 1 to 65 535.
Ch	DST	Channel Destination Address	The byte address to which data is transferred
10h <sup>(1)</sup>	SRCBIDX	Source BCNT Index	Signed value specifying the byte address offset between source arrays within a frame (2nd dimension). Valid values range from -32 768 and 32 767.
	DSTBIDX	Destination BCNT Index	Signed value specifying the byte address offset between destination arrays within a frame (2nd dimension). Valid values range from -32 768 and 32 767.
14h <sup>(1)</sup>	LINK	Link Address	The PaRAM address containing the PaRAM set to be linked (copied from) when the current PaRAM set is exhausted. A value of FFFFh specifies a null link.
	BCNTRLD	BCNT Reload	The count value used to reload BCNT when BCNT decrements to 0 (TR is submitted for the last array in 2nd dimension). Only relevant in A-synchronized transfers.
18h <sup>(1)</sup>	SRCCIDX	Source CCNT Index	Signed value specifying the byte address offset between frames within a block (3rd dimension). Valid values range from -32 768 and 32 767.  A-synchronized transfers: The byte address offset from the beginning of the last source array in a frame to the beginning of the first source array in the next frame.  AB-synchronized transfers: The byte address offset from the beginning of the first source array in a frame to the beginning of the first source array in the next frame.
	DSTCIDX	Destination CCNT index	Signed value specifying the byte address offset between frames within a block (3rd dimension). Valid values range from -32 768 and 32 767.  A-synchronized transfers: The byte address offset from the beginning of the last destination array in a frame to the beginning of the first destination array in the next frame.  AB-synchronized transfers: The byte address offset from the beginning of the first destination array in a frame to the beginning of the first destination array in the next frame.
1Ch	CCNT	Count for 3rd Dimension	Unsigned value specifying the number of frames in a block, where a frame is BCNT arrays of ACNT bytes. Valid values range from 1 to 65 535.
	RSVD	Reserved	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.

<sup>(1)</sup> It is recommended to access the parameter set sets as 32-bit words whenever possible.

### 11.3.3.2 EDMA3 Channel PaRAM Set Entry Fields

#### 11.3.3.2.1 Channel Options Parameter (OPT)

The channel options parameter (OPT) is shown in [Figure 11-10](#) and described in [Table 11-7](#).

**Figure 11-10. Channel Options Parameter (OPT)**

31	30	28	27	24	23	22	21	20	19	18	17	16	
PRIV	Reserved		PRIVID	ITCCHEN	TCCHEN	ITCINTEN	TCINTEN	Reserved				TCC	
R-0	R-0		R-0	R/W-0	R/W-0	R/W-0	R/W-0			R/W-0		R/W-0	
		15	12	11	10	8	7		4	3	2	1	0
		TCC	TCCMOD E	FWID				Reserved		STATIC	SYNCDIM	DAM	SAM
		R/W-0	R/W-0	R/W-0				R/W-0		R/W-0	R/W-0	R/W-0	R/W-0

**Table 11-7. Channel Options Parameters (OPT) Field Descriptions**

Bit	Field	Value	Description
31	PRIV	0 1	Privilege level (supervisor versus user) for the host/CPU/DMA that programmed this PaRAM set. This value is set with the EDMA3 master's privilege value when any part of the PaRAM set is written. User level privilege. Supervisor level privilege.
30-28	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
27-24	PRIVID	0-Fh	Privilege identification for the external host/CPU/DMA that programmed this PaRAM set. This value is set with the EDMA3 master's privilege identification value when any part of the PaRAM set is written.
23	ITCCHEN	0 1	Intermediate transfer completion chaining enable. 0 Intermediate transfer complete chaining is disabled. 1 Intermediate transfer complete chaining is enabled. When enabled, the chained event register (CER/CERH) bit is set on every intermediate chained transfer completion (upon completion of every intermediate TR in the PaRAM set, except the final TR in the PaRAM set). The bit (position) set in CER or CERH is the TCC value specified.
22	TCCHEN	0 1	Transfer complete chaining enable. 0 Transfer complete chaining is disabled. 1 Transfer complete chaining is enabled. When enabled, the chained event register (CER/CERH) bit is set on final chained transfer completion (upon completion of the final TR in the PaRAM set). The bit (position) set in CER or CERH is the TCC value specified.
21	ITCINTEN	0 1	Intermediate transfer completion interrupt enable. 0 Intermediate transfer complete interrupt is disabled. 1 Intermediate transfer complete interrupt is enabled. When enabled, the interrupt pending register (IPR / IPRH) bit is set on every intermediate transfer completion (upon completion of every intermediate TR in the PaRAM set, except the final TR in the PaRAM set). The bit (position) set in IPR or IPRH is the TCC value specified. To generate a completion interrupt to the CPU, the corresponding IER [TCC] / IERH [TCC] bit must be set.
20	TCINTEN	0 1	Transfer complete interrupt enable. 0 Transfer complete interrupt is disabled. 1 Transfer complete interrupt is enabled. When enabled, the interrupt pending register (IPR / IPRH) bit is set on transfer completion (upon completion of the final TR in the PaRAM set). The bit (position) set in IPR or IPRH is the TCC value specified. To generate a completion interrupt to the CPU, the corresponding IER [TCC] / IERH [TCC] bit must be set.
19-18	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.

**Table 11-7. Channel Options Parameters (OPT) Field Descriptions (continued)**

Bit	Field	Value	Description
17-12	TCC	0-3Fh	Transfer complete code. This 6-bit code sets the relevant bit in the chaining enable register (CER [TCC] / CERH [TCC]) for chaining or in the interrupt pending register (IPR [TCC] / IPRH [TCC]) for interrupts.
11	TCCMODE	0 1	Transfer complete code mode. Indicates the point at which a transfer is considered completed for chaining and interrupt generation. 0 Normal completion: A transfer is considered completed after the data has been transferred. 1 Early completion: A transfer is considered completed after the EDMA3CC submits a TR to the EDMA3TC. TC may still be transferring data when the interrupt/chain is triggered.
10-8	FWID	0-7h 0 1h 2h 3h 4h 5h 6h-7h	FIFO Width. Applies if either SAM or DAM is set to constant addressing mode. 0 FIFO width is 8-bit. 1h FIFO width is 16-bit. 2h FIFO width is 32-bit. 3h FIFO width is 64-bit. 4h FIFO width is 128-bit. 5h FIFO width is 256-bit. 6h-7h Reserved.
7-4	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
3	STATIC	0 1	Static set. 0 Set is not static. The PaRAM set is updated or linked after a TR is submitted. A value of 0 should be used for DMA channels and for non-final transfers in a linked list of QDMA transfers. 1 Set is static. The PaRAM set is not updated or linked after a TR is submitted. A value of 1 should be used for isolated QDMA transfers or for the final transfer in a linked list of QDMA transfers.
2	SYNCDIM	0 1	Transfer synchronization dimension. 0 A-synchronized. Each event triggers the transfer of a single array of ACNT bytes. 1 AB-synchronized. Each event triggers the transfer of BCNT arrays of ACNT bytes.
1	DAM	0 1	Destination address mode. 0 Increment (INCR) mode. Destination addressing within an array increments. Destination is not a FIFO. 1 Constant addressing (CONST) mode. Destination addressing within an array wraps around upon reaching FIFO width.
0	SAM	0 1	Source address mode. 0 Increment (INCR) mode. Source addressing within an array increments. Source is not a FIFO. 1 Constant addressing (CONST) mode. Source addressing within an array wraps around upon reaching FIFO width.

### 11.3.3.2 Channel Source Address (SRC)

The 32-bit source address parameter specifies the starting byte address of the source. For SAM in increment mode, there are no alignment restrictions imposed by EDMA3. For SAM in constant addressing mode, you must program the source address to be aligned to a 256-bit aligned address (5 LSBs of address must be 0). The EDMA3TC will signal an error, if this rule is violated. See [Section 11.3.12.3](#) for additional details.

### 11.3.3.3 Channel Destination Address (DST)

The 32-bit destination address parameter specifies the starting byte address of the destination. For DAM in increment mode, there are no alignment restrictions imposed by EDMA3. For DAM in constant addressing mode, you must program the destination address to be aligned to a 256-bit aligned address (5 LSBs of address must be 0). The EDMA3TC will signal an error, if this rule is violated. See [Section 11.3.12.3](#) for additional details.

#### **11.3.3.2.4 Count for 1st Dimension (ACNT)**

ACNT represents the number of bytes within the 1st dimension of a transfer. ACNT is a 16-bit unsigned value with valid values between 0 and 65 535. Therefore, the maximum number of bytes in an array is 65 535 bytes (64K – 1 bytes). ACNT must be greater than or equal to 1 for a TR to be submitted to EDMA3TC. A transfer with ACNT equal to 0 is considered either a null or dummy transfer. A dummy or null transfer generates a completion code depending on the settings of the completion bit fields in OPT.

See [Section 11.3.3.5](#) and [Section 11.3.5.3](#) for details on dummy/null completion conditions.

#### **11.3.3.2.5 Count for 2nd Dimension (BCNT)**

BCNT is a 16-bit unsigned value that specifies the number of arrays of length ACNT. For normal operation, valid values for BCNT are between 1 and 65 535. Therefore, the maximum number of arrays in a frame is 65 535 (64K – 1 arrays). A transfer with BCNT equal to 0 is considered either a null or dummy transfer. A dummy or null transfer generates a completion code depending on the settings of the completion bit fields in OPT.

See [Section 11.3.3.5](#) and [Section 11.3.5.3](#) for details on dummy/null completion conditions.

#### **11.3.3.2.6 Count for 3rd Dimension (CCNT)**

CCNT is a 16-bit unsigned value that specifies the number of frames in a block. Valid values for CCNT are between 1 and 65 535. Therefore, the maximum number of frames in a block is 65 535 (64K – 1 frames). A transfer with CCNT equal to 0 is considered either a null or dummy transfer. A dummy or null transfer generates a completion code depending on the settings of the completion bit fields in OPT.

A CCNT value of 0 is considered either a null or dummy transfer. See [Section 11.3.3.5](#) and [Section 11.3.5.3](#) for details on dummy/null completion conditions.

#### **11.3.3.2.7 BCNT Reload (BCNTRLD)**

BCNTRLD is a 16-bit unsigned value used to reload the BCNT field once the last array in the 2nd dimension is transferred. This field is only used for A-synchronized transfers. In this case, the EDMA3CC decrements the BCNT value by 1 on each TR submission. When BCNT reaches 0, the EDMA3CC decrements CCNT and uses the BCNTRLD value to reinitialize the BCNT value.

For AB-synchronized transfers, the EDMA3CC submits the BCNT in the TR and the EDMA3TC decrements BCNT appropriately. For AB-synchronized transfers, BCNTRLD is not used.

#### **11.3.3.2.8 Source B Index (SRCBIDX)**

SRCBIDX is a 16-bit signed value (2s complement) used for source address modification between each array in the 2nd dimension. Valid values for SRCBIDX are between –32 768 and 32 767. It provides a byte address offset from the beginning of the source array to the beginning of the next source array. It applies to both A-synchronized and AB-synchronized transfers. Some examples:

- SRCBIDX = 0000h (0): no address offset from the beginning of an array to the beginning of the next array. All arrays are fixed to the same beginning address.
- SRCBIDX = 0003h (+3): the address offset from the beginning of an array to the beginning of the next array in a frame is 3 bytes. For example, if the current array begins at address 1000h, the next array begins at 1003h.
- SRCBIDX = FFFFh (–1): the address offset from the beginning of an array to the beginning of the next array in a frame is –1 byte. For example, if the current array begins at address 5054h, the next array begins at 5053h.

#### **11.3.3.2.9 Destination B Index (DSTBIDX)**

DSTBIDX is a 16-bit signed value (2s complement) used for destination address modification between each array in the 2nd dimension. Valid values for DSTBIDX are between –32 768 and 32 767. It provides a byte address offset from the beginning of the destination array to the beginning of the next destination array within the current frame. It applies to both A-synchronized and AB-synchronized transfers. See SRCBIDX for examples.

#### 11.3.3.2.10 Source C Index (SRCCIDX)

SRCCIDX is a 16-bit signed value (2s complement) used for source address modification in the 3rd dimension. Valid values for SRCCIDX are between  $-32\,768$  and  $32\,767$ . It provides a byte address offset from the beginning of the current array (pointed to by SRC address) to the beginning of the first source array in the next frame. It applies to both A-synchronized and AB-synchronized transfers. Note that when SRCCIDX is applied, the current array in an A-synchronized transfer is the last array in the frame (Figure 11-7), while the current array in an AB-synchronized transfer is the first array in the frame (Figure 11-8).

#### 11.3.3.2.11 Destination C Index (DSTCIDX)

DSTCIDX is a 16-bit signed value (2s complement) used for destination address modification in the 3rd dimension. Valid values are between  $-32\,768$  and  $32\,767$ . It provides a byte address offset from the beginning of the current array (pointed to by DST address) to the beginning of the first destination array TR in the next frame. It applies to both A-synchronized and AB-synchronized transfers. Note that when DSTCIDX is applied, the current array in an A-synchronized transfer is the last array in the frame (Figure 11-7), while the current array in a AB-synchronized transfer is the first array in the frame (Figure 11-8).

#### 11.3.3.2.12 Link Address (LINK)

The EDMA3CC provides a mechanism, called linking, to reload the current PaRAM set upon its natural termination (that is, after the count fields are decremented to 0) with a new PaRAM set. The 16-bit parameter LINK specifies the byte address offset in the PaRAM from which the EDMA3CC loads/reloads the next PaRAM set during linking.

You must program the link address to point to a valid aligned 32-byte PaRAM set. The 5 LSBs of the LINK field should be cleared to 0.

The EDMA3CC ignores the upper 2 bits of the LINK entry, allowing the programmer the flexibility of programming the link address as either an absolute/literal byte address or use the PaRAM-base-relative offset address. Therefore, if you make use of the literal address with a range from 4000h to 7FFFh, it will be treated as a PaRAM-base-relative value of 0000h to 3FFFh.

You should make sure to program the LINK field correctly, so that link update is requested from a PaRAM address that falls in the range of the available PaRAM addresses on the device.

A LINK value of FFFFh is referred to as a NULL link that should cause the EDMA3CC to perform an internal write of 0 to all entries of the current PaRAM set, except for the LINK field that is set to FFFFh. Also, see Section 11.3.5 for details on terminating a transfer.

#### 11.3.3.3 Null PaRAM Set

A null PaRAM set is defined as a PaRAM set where all count fields (ACNT, BCNT, and CCNT) are cleared to 0. If a PaRAM set associated with a channel is a NULL set, then when serviced by the EDMA3CC, the bit corresponding to the channel is set in the associated event missed register (EMR, EMRH, or QEMR). This bit remains set in the associated secondary event register (SER, SERH, or QSER). *This implies that any future events on the same channel are ignored by the EDMA3CC and you are required to clear the bit in SER, SERH, or QSER for the channel.* This is considered an error condition, since events are not expected on a channel that is configured as a null transfer. See Section 11.4.1.6.8 and Section 11.4.1.2.1 for more information on the SER and EMR registers, respectively.

#### 11.3.3.4 Dummy PaRAM Set

A dummy PaRAM set is defined as a PaRAM set where at least one of the count fields (ACNT, BCNT, or CCNT) is cleared to 0 and at least one of the count fields is nonzero.

If a PaRAM set associated with a channel is a dummy set, then when serviced by the EDMA3CC, it will not set the bit corresponding to the channel (DMA/QDMA) in the event missed register (EMR, EMRH, or QEMR) and the secondary event register (SER, SERH, or QSER) bit gets cleared similar to a normal transfer. Future events on that channel are serviced. A dummy transfer is a legal transfer of 0 bytes. See [Section 11.4.1.6.8](#) and [Section 11.4.1.2.1](#) for more information on the SER and EMR registers, respectively.

### 11.3.3.5 Dummy Versus Null Transfer Comparison

There are some differences in the way the EDMA3CC logic treats a dummy versus a null transfer request. A null transfer request is an error condition, but a dummy transfer is a legal transfer of 0 bytes. A null transfer causes an error bit ( $En$ ) in EMR to get set and the  $En$  bit in SER remains set, essentially preventing any further transfers on that channel without clearing the associated error registers.

[Table 11-8](#) summarizes the conditions and effects of null and dummy transfer requests.

**Table 11-8. Dummy and Null Transfer Request**

Feature	Null TR	Dummy TR
EMR/EMRH/QEMR is set	Yes	No
SER/SERH/QSER remains set	Yes	No
Link update (STATIC = 0 in OPT)	Yes	Yes
QER is set	Yes	Yes
IPR/IPRH CER/CERH is set using early completion	Yes	Yes

### 11.3.3.6 Parameter Set Updates

When a TR is submitted for a given DMA/QDMA channel and its corresponding PaRAM set, the EDMA3CC is responsible for updating the PaRAM set in anticipation of the next trigger event. For events that are not final, this includes address and count updates; for final events, this includes the link update.

The specific PaRAM set entries that are updated depend on the channel's synchronization type (A-synchronized or B-synchronized) and the current state of the PaRAM set. A B-update refers to the decrementing of BCNT in the case of A-synchronized transfers after the submission of successive TRs. A C-update refers to the decrementing of CCNT in the case of A-synchronized transfers after BCNT TRs for ACNT byte transfers have submitted. For AB-synchronized transfers, a C-update refers to the decrementing of CCNT after submission of every transfer request.

See [Table 11-9](#) for details and conditions on the parameter updates. A link update occurs when the PaRAM set is exhausted, as described in [Section 11.3.3.7](#).

After the TR is read from the PaRAM (and is in process of being submitted to EDMA3TC), the following fields are updated if needed:

- A-synchronized: BCNT, CCNT, SRC, DST.
- AB-synchronized: CCNT, SRC, DST.

The following fields are not updated (except for during linking, where all fields are overwritten by the link PaRAM set):

- A-synchronized: ACNT, BCNTRLD, SRCBIDX, DSTBIDX, SRCCIDX, DSTCIDX, OPT, LINK.
- AB-synchronized: ACNT, BCNT, BCNTRLD, SRCBIDX, DSTBIDX, SRCCIDX, DSTCIDX, OPT, LINK.

Note that PaRAM updates only pertain to the information that is needed to properly submit the next transfer request to the EDMA3TC. Updates that occur while data is moved within a transfer request are tracked within the transfer controller, and is detailed in [Section 11.3.12](#). For A-synchronized transfers, the EDMA3CC always submits a TRP for ACNT bytes (BCNT = 1 and CCNT = 1). For AB-synchronized transfers, the EDMA3CC always submits a TRP for ACNT bytes of BCNT arrays (CCNT = 1). The EDMA3TC is responsible for updating source and destination addresses within the array based on ACNT and FWID (in OPT). For AB-synchronized transfers, the EDMA3TC is also responsible to update source and destination addresses between arrays based on SRCBIDX and DSTBIDX.

[Table 11-9](#) shows the details of parameter updates that occur within EDMA3CC for A-synchronized and AB-synchronized transfers.

**Table 11-9. Parameter Updates in EDMA3CC (for Non-Null, Non-Dummy PaRAM Set)**

	A-Synchronized Transfer			AB-Synchronized Transfer		
	B-Update	C-Update	Link Update	B-Update	C-Update	Link Update
Condition:	BCNT > 1	BCNT == 1 && CCNT > 1	BCNT == 1 && CCNT == 1	N/A	CCNT > 1	CCNT == 1
SRC	+= SRCBIDX	+= SRCCIDX	= Link.SRC	in EDMA3TC	+= SRCCIDX	= Link.SRC
DST	+= DSTBIDX	+= DSTCIDX	= Link.DST	in EDMA3TC	+= DSTCIDX	= Link.DST
ACNT	None	None	= Link.ACNT	None	None	= Link.ACNT
BCNT	-= 1	= BCNTRLD	= Link.BCNT	in EDMA3TC	N/A	= Link.BCNT
CCNT	None	-= 1	= Link.CCNT	in EDMA3TC	-=1	= Link.CCNT
SRCBIDX	None	None	= Link.SRCBIDX	in EDMA3TC	None	= Link.SRCBIDX
DSTBIDX	None	None	= Link.DSTBIDX	None	None	= Link.DSTBIDX
SRCCIDX	None	None	= Link.SRCCIDX	in EDMA3TC	None	= Link.SRCCIDX
DSTCIDX	None	None	= Link.DSTCIDX	None	None	= Link.DSTCIDX
LINK	None	None	= Link.LINK	None	None	= Link.LINK
BCNTRLD	None	None	= Link.BCNTRLD	None	None	= Link.BCNTRLD
OPT <sup>(1)</sup>	None	None	= LINK.OPT	None	None	= LINK.OPT

<sup>(1)</sup> In all cases, no updates occur if OPT.STATIC == 1 for the current PaRAM set.

**NOTE:** The EDMA3CC includes no special hardware to detect when an indexed address update calculation overflows/underflows. The address update will wrap across boundaries as programmed by the user. You should ensure that no transfer is allowed to cross internal port boundaries between peripherals. A single TR must target a single source/destination slave endpoint.

### 11.3.3.7 Linking Transfers

The EDMA3CC provides a mechanism known as linking, which allows the entire PaRAM set to be reloaded from a location within the PaRAM memory map (for both DMA and QDMA channels). Linking is especially useful for maintaining ping-pong buffers, circular buffering, and repetitive/continuous transfers with no CPU intervention. Upon completion of a transfer, the current transfer parameters are reloaded with the parameter set pointed that the 16-bit link address field of the current parameter set points to. Linking only occurs when the STATIC bit in OPT is cleared.

---

**NOTE:** You should always link a transfer (EDMA3 or QDMA) to another useful transfer. If you must terminate a transfer, then you should link the transfer to a NULL parameter set. See [Section 11.3.3.3](#).

---

The link update occurs after the current PaRAM set event parameters have been exhausted. An event's parameters are exhausted when the EDMA3 channel controller has submitted all of the transfers that are associated with the PaRAM set.

A link update occurs for null and dummy transfers depending on the state of the STATIC bit in OPT and the LINK field. In both cases (null or dummy), if the value of LINK is FFFFh, then a null PaRAM set (with all 0s and LINK set to FFFFh) is written to the current PaRAM set. Similarly, if LINK is set to a value other than FFFFh, then the appropriate PaRAM location that LINK points to is copied to the current PaRAM set.

Once the channel completion conditions are met for an event, the transfer parameters that are located at the link address are loaded into the current DMA or QDMA channel's associated parameter set. This indicates that the EDMA3CC reads the entire set (eight words) from the PaRAM set specified by LINK and writes all eight words to the PaRAM set that is associated with the current channel. [Figure 11-11](#) shows an example of a linked transfer.

Any PaRAM set in the PaRAM can be used as a link/reload parameter set. The PaRAM sets associated with peripheral synchronization events (see [Section 11.3.6](#)) should only be used for linking if the corresponding events are disabled.

If a PaRAM set location is defined as a QDMA channel PaRAM set (by QCHMAP $n$ ), then copying the link PaRAM set into the current QDMA channel PaRAM set is recognized as a trigger event. It is latched in QER because a write to the trigger word was performed. You can use this feature to create a linked list of transfers using a single QDMA channel and multiple PaRAM sets. See [Section 11.3.4.2](#).

Linking to itself replicates the behavior of auto-initialization, thus facilitating the use of circular buffering and repetitive transfers. After an EDMA3 channel exhausts its current PaRAM set, it reloads all of the parameter set entries from another PaRAM set, which is initialized with values that are identical to the original PaRAM set. [Figure 11-11](#) shows an example of a linked to self transfer. Here, the PaRAM set 255 has the link field pointing to the address of parameter set 255 (linked to self).

---

**NOTE:** If the STATIC bit in OPT is set for a PaRAM set, then link updates are not performed.

---

### 11.3.3.8 Constant Addressing Mode Transfers/Alignment Issues

If either SAM or DAM is set (constant addressing mode), then the source or destination address must be aligned to a 256-bit aligned address, respectively, and the corresponding BIDX should be an even multiple of 32 bytes (256 bits). The EDMA3CC does not recognize errors here, but the EDMA3TC asserts an error if this is not true. See [Section 11.3.12.3](#).

---

**NOTE:** The constant addressing (CONST) mode has limited applicability. The EDMA3 should be configured for the constant addressing mode (SAM/DAM = 1) only if the transfer source or destination (on-chip memory, off-chip memory controllers, slave peripherals) support the constant addressing mode. See the device-specific data manual and/or peripheral user's guide to verify if the constant addressing mode is supported. If the constant addressing mode is not supported, the similar logical transfer can be achieved using the increment (INCR) mode (SAM/DAM =0) by appropriately programming the count and indices values.

---

### 11.3.3.9 Element Size

The EDMA3 controller does not use element-size and element-indexing. Instead, all transfers are defined in terms of all three dimensions: ACNT, BCNT, and CCNT. An element-indexed transfer is logically achieved by programming ACNT to the size of the element and BCNT to the number of elements that need to be transferred. For example, if you have 16-bit audio data and 256 audio samples that must be transferred to a serial port, you can only do this by programming the ACNT = 2 (2 bytes) and BCNT = 256.

Figure 11-11. Linked Transfer

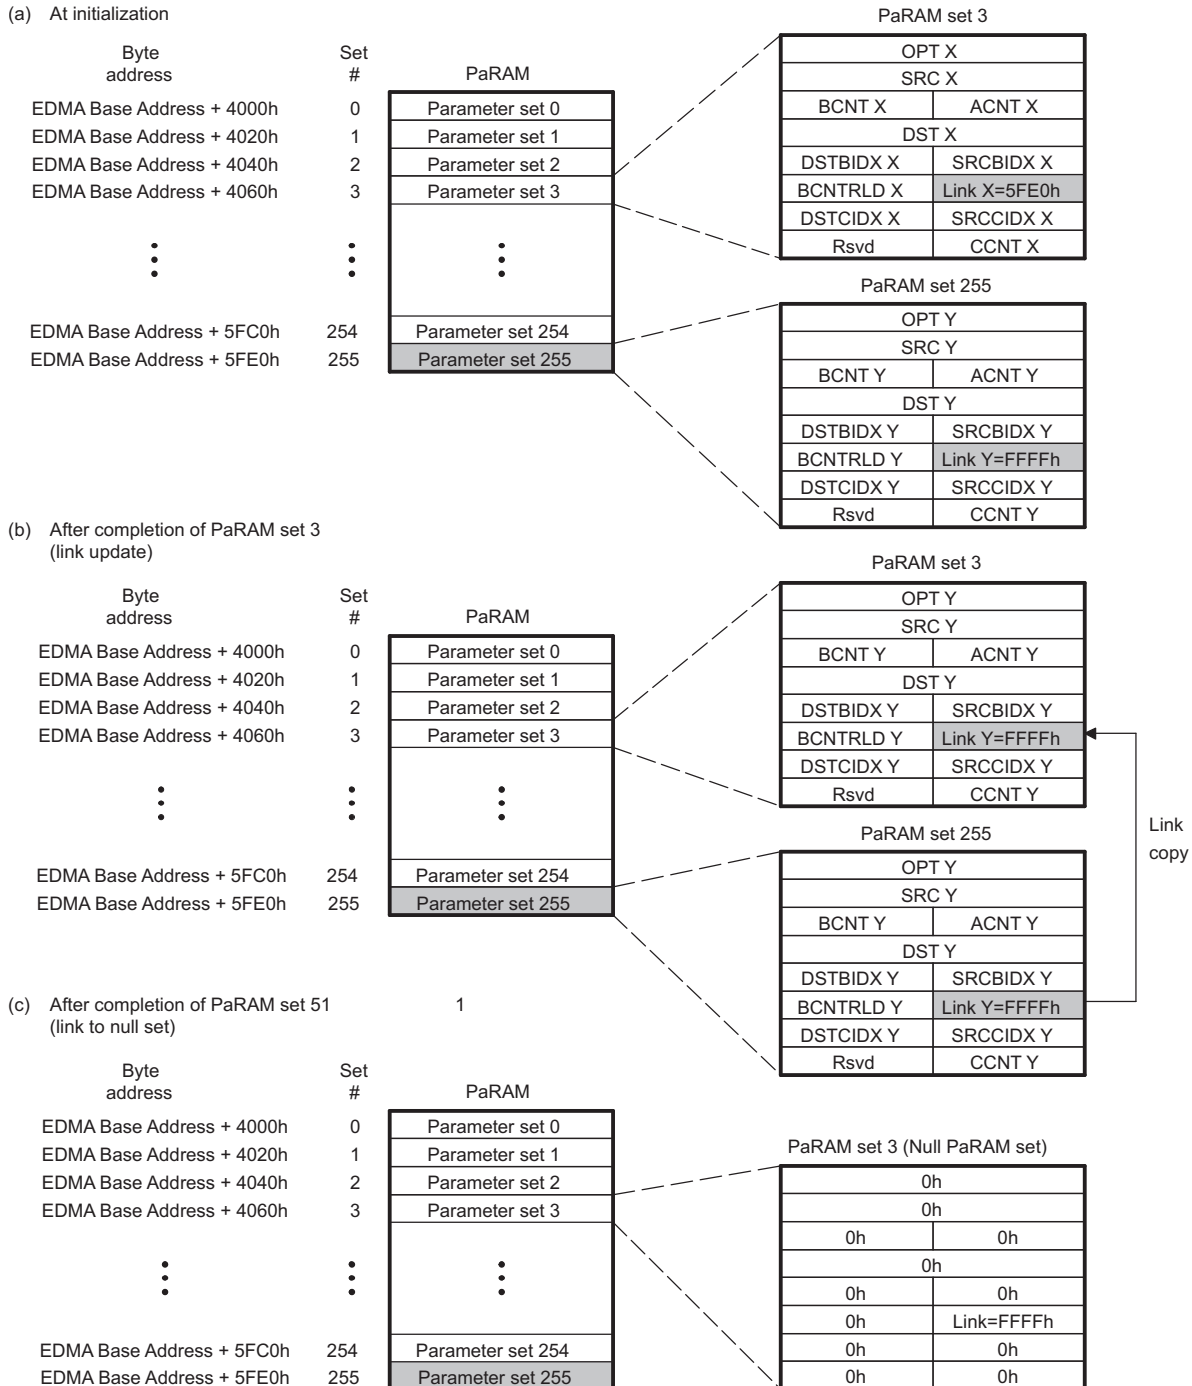

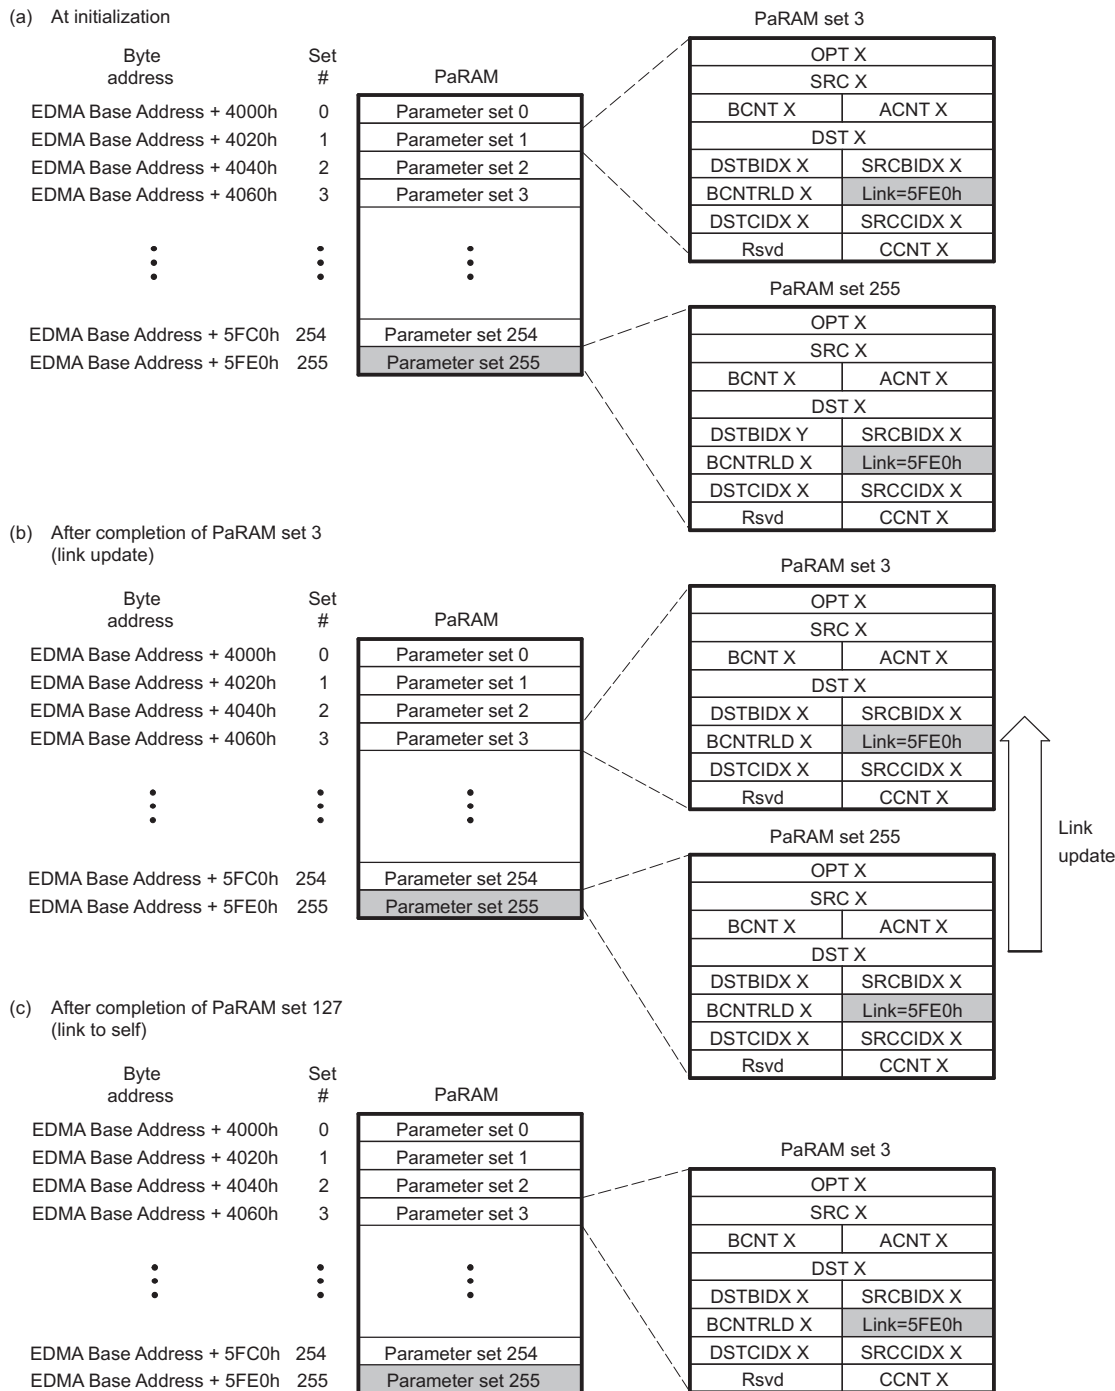

Figure 11-12. Link-to-Self Transfer

### 11.3.4 Initiating a DMA Transfer

There are multiple ways to initiate a programmed data transfer using the EDMA3 channel controller. Transfers on DMA channels are initiated by three sources.

They are listed as follows:

- **Event-triggered transfer request** (this is the more typical usage of EDMA3): A peripheral, system, or externally-generated event triggers a transfer request.
- **Manually-triggered transfer request:**The CPU to manually triggers a transfer by writing a 1 to the

corresponding bit in the event set register (ESR/ESRH).

- **Chain-triggered transfer request:** A transfer is triggered on the completion of another transfer or sub-transfer.

Transfers on QDMA channels are initiated by two sources. They are as follows:

- **Auto-triggered transfer request:** Writing to the programmed trigger word triggers a transfer.
- **Link-triggered transfer requests:** Writing to the trigger word triggers the transfer when linking occurs.

### 11.3.4.1 DMA Channel

#### 11.3.4.1.1 Event-Triggered Transfer Request

When an event is asserted from a peripheral or device pins, it gets latched in the corresponding bit of the event register ( $ER.En = 1$ ). If the corresponding event in the event enable register (EER) is enabled ( $EER.En = 1$ ), then the EDMA3CC prioritizes and queues the event in the appropriate event queue. When the event reaches the head of the queue, it is evaluated for submission as a transfer request to the transfer controller.

If the PaPARAM set is valid (not a NULL set), then a transfer request packet (TRP) is submitted to the EDMA3TC and the  $En$  bit in ER is cleared. At this point, a new event can be safely received by the EDMA3CC.

If the PaPARAM set associated with the channel is a NULL set (see [Section 11.3.3.3](#)), then no transfer request (TR) is submitted and the corresponding  $En$  bit in ER is cleared and simultaneously the corresponding channel bit is set in the event miss register ( $EMR.En = 1$ ) to indicate that the event was discarded due to a null TR being serviced. Good programming practices should include cleaning the event missed error before re-triggering the DMA channel.

When an event is received, the corresponding event bit in the event register is set ( $ER.En = 1$ ), regardless of the state of  $EER.En$ . If the event is disabled when an external event is received ( $ER.En = 1$  and  $EER.En = 0$ ), the  $ER.En$  bit remains set. If the event is subsequently enabled ( $EER.En = 1$ ), then the pending event is processed by the EDMA3CC and the TR is processed/submitted, after which the  $ER.En$  bit is cleared.

If an event is being processed (prioritized or is in the event queue) and another sync event is received for the same channel prior to the original being cleared ( $ER.En \neq 0$ ), then the second event is registered as a missed event in the corresponding bit of the event missed register ( $EMR.En = 1$ ).

See [Section 9.2.3](#), *EDMA Event Multiplexing*, for a description of how DMA events map to the EDMA event crossbar. See [Section 11.3.20](#), *EDMA Events*, for a table of direct and crossbar mapped EDMA events.

#### 11.3.4.1.2 Manually Triggered Transfer Request

The CPU or any EDMA programmer initiates a DMA transfer by writing to the event set register (ESR). Writing a 1 to an event bit in the ESR results in the event being prioritized/queued in the appropriate event queue, regardless of the state of the  $EER.En$  bit. When the event reaches the head of the queue, it is evaluated for submission as a transfer request to the transfer controller.

As in the event-triggered transfers, if the PaPARAM set associated with the channel is valid (it is not a null set) then the TR is submitted to the associated EDMA3TC and the channel can be triggered again.

If the PaPARAM set associated with the channel is a NULL set (see [Section 11.3.3.3](#)), then no transfer request (TR) is submitted and the corresponding  $En$  bit in ER is cleared and simultaneously the corresponding channel bit is set in the event miss register ( $EMR.En = 1$ ) to indicate that the event was discarded due to a null TR being serviced. Good programming practices should include clearing the event missed error before re-triggering the DMA channel.

If an event is being processed (prioritized or is in the event queue) and the same channel is manually set by a write to the corresponding channel bit of the event set register ( $ESR.En = 1$ ) prior to the original being cleared ( $ESR.En = 0$ ), then the second event is registered as a missed event in the corresponding bit of the event missed register ( $EMR.En = 1$ ).

### 11.3.4.1.3 Chain-Triggered Transfer Request

Chaining is a mechanism by which the completion of one transfer automatically sets the event for another channel. When a chained completion code is detected, the value of which is dictated by the transfer completion code (TCC[5:0] in OPT of the PaRAM set associated with the channel), it results in the corresponding bit in the chained event register (CER) to be set (CER.E[TCC] = 1).

Once a bit is set in CER, the EDMA3CC prioritizes and queues the event in the appropriate event queue. When the event reaches the head of the queue, it is evaluated for submission as a transfer request to the transfer controller.

As in the event-triggered transfers, if the PaRAM set associated with the channel is valid (it is not a null set) then the TR is submitted to the associated EDMA3TC and the channel can be triggered again.

If the PaRAM set associated with the channel is a NULL set (see [Section 11.3.3.3](#)), then no transfer request (TR) is submitted and the corresponding  $En$  bit in CER is cleared and simultaneously the corresponding channel bit is set in the event miss register (EMR. $En$  = 1) to indicate that the event was discarded due to a null TR being serviced. In this case, the error condition must be cleared by you before the DMA channel can be re-triggered. Good programming practices might include clearing the event missed error before re-triggering the DMA channel.

If a chaining event is being processed (prioritized or queued) and another chained event is received for the same channel prior to the original being cleared (CER. $En$  != 0), then the second chained event is registered as a missed event in the corresponding channel bit of the event missed register (EMR. $En$  = 1).

---

**NOTE:** Chained event registers, event registers, and event set registers operate independently. An event ( $En$ ) can be triggered by any of the trigger sources (event-triggered, manually-triggered, or chain-triggered).

---

## 11.3.4.2 QDMA Channels

### 11.3.4.2.1 Auto-triggered and Link-Triggered Transfer Request

QDMA-based transfer requests are issued when a QDMA event gets latched in the QDMA event register (QER. $En$  = 1). A bit corresponding to a QDMA channel is set in the QDMA event register (QER) when the following occurs:

- A CPU (or any EDMA3 programmer) write occurs to a PaRAM address that is defined as a QDMA channel trigger word (programmed in the QDMA channel mapping register (QCHMAP $n$ )) for the particular QDMA channel and the QDMA channel is enabled via the QDMA event enable register (QEER. $En$  = 1).
- EDMA3CC performs a link update on a PaRAM set address that is configured as a QDMA channel (matches QCHMAP $n$  settings) and the corresponding channel is enabled via the QDMA event enable register (QEER. $En$  = 1).

Once a bit is set in QER, the EDMA3CC prioritizes and queues the event in the appropriate event queue. When the event reaches the head of the queue, it is evaluated for submission as a transfer request to the transfer controller.

As in the event-triggered transfers, if the PaRAM set associated with the channel is valid (it is not a null set) then the TR is submitted to the associated EDMA3TC and the channel can be triggered again.

If a bit is already set in QER (QER. $En$  = 1) and a second QDMA event for the same QDMA channel occurs prior to the original being cleared, the second QDMA event gets captured in the QDMA event miss register (QEMR. $En$  = 1).

### 11.3.4.3 Comparison Between DMA and QDMA Channels

The primary difference between DMA and QDMA channels is the event/channel synchronization. QDMA events are either auto-triggered or link triggered. auto-triggering allows QDMA channels to be triggered by CPU(s) with a minimum number of linear writes to PaRAM. Link triggering allows a linked list of transfers to be executed, using a single QDMA PaRAM set and multiple link PaRAM sets.

A QDMA transfer is triggered when a CPU (or other EDMA3 programmer) writes to the trigger word of the QDMA channel parameter set (auto-triggered) or when the EDMA3CC performs a link update on a PaRAM set that has been mapped to a QDMA channel (link triggered). Note that for CPU triggered (manually triggered) DMA channels, in addition to writing to the PaRAM set, it is required to write to the event set register (ESR) to kick-off the transfer.

QDMA channels are typically for cases where a single event will accomplish a complete transfer since the CPU (or EDMA3 programmer) must reprogram some portion of the QDMA PaRAM set in order to re-trigger the channel. In other words, QDMA transfers are programmed with BCNT = CCNT = 1 for A-synchronized transfers, and CCNT = 1 for AB-synchronized transfers.

Additionally, since linking is also supported (if STATIC = 0 in OPT) for QDMA transfers, it allows you to initiate a linked list of QDMAs, so when EDMA3CC copies over a link PaRAM set (including the write to the trigger word), the current PaRAM set mapped to the QDMA channel will automatically be recognized as a valid QDMA event and initiate another set of transfers as specified by the linked set.

### 11.3.5 Completion of a DMA Transfer

A parameter set for a given channel is complete when the required number of transfer requests is submitted (based on receiving the number of synchronization events). The expected number of TRs for a non-null/non-dummy transfer is shown in [Table 11-10](#) for both synchronization types along with state of the PaRAM set prior to the final TR being submitted. When the counts (BCNT and/or CCNT) are this value, the next TR results in a:

- Final chaining or interrupt codes to be sent by the transfer controllers (instead of intermediate).
- Link updates (linking to either null or another valid link set).

**Table 11-10. Expected Number of Transfers for Non-Null Transfer**

Sync Mode	Counts at time 0	Total # Transfers	Counts prior to final TR
A-synchronized	ACNT BCNT CCNT	(BCNT × CCNT) TRs of ACNT bytes each	BCNT == 1 && CCNT == 1
AB-synchronized	ACNT BCNT CCNT	CCNT TRs for ACNT × BCNT bytes each	CCNT == 1

You must program the PaRAM OPT field with a specific transfer completion code (TCC) along with the other OPT fields (TCCHEN, TCINTEN, ITCCHEN, and ITCINTEN bits) to indicate whether the completion code is to be used for generating a chained event or/and for generating an interrupt upon completion of a transfer.

The specific TCC value (6-bit binary value) programmed dictates which of the 64-bits in the chain event register (CER[TCC]) and/or interrupt pending register (IPR[TCC]) is set.

You can also selectively program whether the transfer controller sends back completion codes on completion of the final transfer request (TR) of a parameter set (TCCHEN or TCINTEN), for all but the final transfer request (TR) of a parameter set (ITCCHEN or ITCINTEN), or for all TRs of a parameter set (both). See [Section 11.3.8](#) for details on chaining (intermediate/final chaining) and [Section 11.3.9](#) for details on intermediate/final interrupt completion.

A completion detection interface exists between the EDMA3 channel controller and transfer controller(s). This interface sends back information from the transfer controller to the channel controller to indicate that a specific transfer is completed. Completion of a transfer is used for generating chained events and/or generating interrupts to the CPU(s).

All DMA/QDMA PaRAM sets must also specify a link address value. For repetitive transfers such as ping-pong buffers, the link address value should point to another predefined PaRAM set. Alternatively, a non-repetitive transfer should set the link address value to the null link value. The null link value is defined as FFFFh. See [Section 11.3.3.7](#) for more details.

**NOTE:** Any incoming events that are mapped to a null PaRAM set results in an error condition. The error condition should be cleared before the corresponding channel is used again. See [Section 11.3.3.5](#).

There are three ways the EDMA3CC gets updated/informed about a transfer completion: normal completion, early completion, and dummy/null completion. This applies to both chained events and completion interrupt generation.

### 11.3.5.1 Normal Completion

In normal completion mode (TCCMODE = 0 in OPT), the transfer or sub-transfer is considered to be complete when the EDMA3 channel controller receives the completion codes from the EDMA3 transfer controller. In this mode, the completion code to the channel controller is posted by the transfer controller after it receives a signal from the destination peripheral. Normal completion is typically used to generate an interrupt to inform the CPU that a set of data is ready for processing.

### 11.3.5.2 Early Completion

In early completion mode (TCCMODE = 1 in OPT), the transfer is considered to be complete when the EDMA3 channel controller submits the transfer request (TR) to the EDMA3 transfer controller. In this mode, the channel controller generates the completion code internally. Early completion is typically useful for chaining, as it allows subsequent transfers to be chained-triggered while the previous transfer is still in progress within the transfer controller, maximizing the overall throughput of the set of the transfers.

### 11.3.5.3 Dummy or Null Completion

This is a variation of early completion. Dummy or null completion is associated with a dummy set ([Section 11.3.3.4](#)) or null set ([Section 11.3.3.3](#)). In both cases, the EDMA3 channel controller does not submit the associated transfer request to the EDMA3 transfer controller(s). However, if the set (dummy/null) has the OPT field programmed to return completion code (intermediate/final interrupt/chaining completion), then it will set the appropriate bits in the interrupt pending registers (IPR/IPRH) or chained event register (CER/CERH). The internal early completion path is used by the channel controller to return the completion codes internally (that is, EDMA3CC generates the completion code).

## 11.3.6 Event, Channel, and PaRAM Mapping

Several of the 64 DMA channels are tied to a specific hardware event, thus allowing events from device peripherals or external hardware to trigger transfers. A DMA channel typically requests a data transfer when it receives its event (apart from manually-triggered, chain-triggered, and other transfers). The amount of data transferred per synchronization event depends on the channel's configuration (ACNT, BCNT, CCNT, etc.) and the synchronization type (A-synchronized or AB-synchronized).

The association of an event to a channel is fixed, each DMA channel has one specific event associated with it. See [Section 9.2.3, EDMA Event Multiplexing](#), for a description of how DMA events map to the EDMA event crossbar. See [Section 11.3.20, EDMA Events](#), for a table of direct and crossbar mapped EDMA events.

In an application, if a channel does not use the associated synchronization event or if it does not have an associated synchronization event (unused), that channel can be used for manually-triggered or chained-triggered transfers, for linking/reloading, or as a QDMA channel.

### 11.3.6.1 DMA Channel to PaRAM Mapping

The mapping between the DMA channel numbers and the PaRAM sets is programmable (see [Table 11-5](#)). The DMA channel mapping registers (DCHMAPn) in the EDMA3CC provide programmability that allows the DMA channels to be mapped to any of the PaRAM sets in the PaRAM memory map. [Figure 11-13](#) illustrates the use of DCHMAP. There is one DCHMAP register per channel.

**Figure 11-13. DMA Channel and QDMA Channel to PaRAM Mapping**

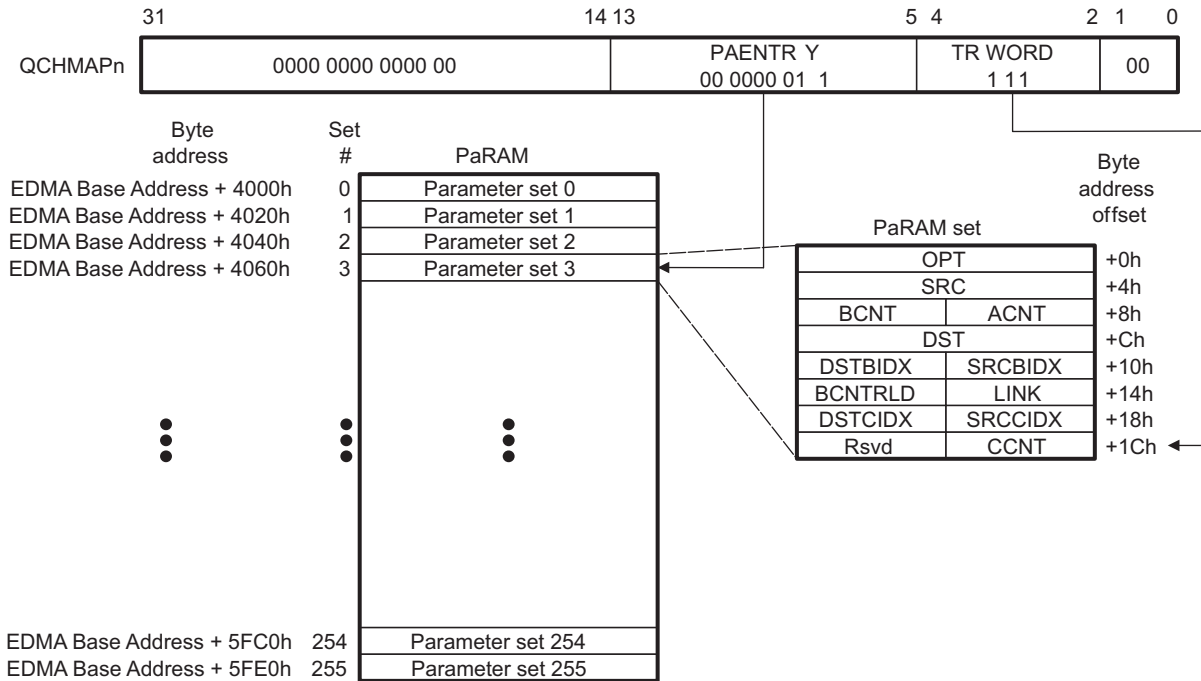

**11.3.6.2 QDMA Channel to PaRAM Mapping**

The mapping between the QDMA channels and the PaRAM sets is programmable. The QDMA channel mapping register (QCHMAP) in the EDMA3CC allows you to map the QDMA channels to any of the PaRAM sets in the PaRAM memory map. Figure 11-14 illustrates the use of QCHMAP.

Additionally, QCHMAP allows you to program the trigger word in the PaRAM set for the QDMA channel. A trigger word is one of the eight words in the PaRAM set. For a QDMA transfer to occur, a valid TR synchronization event for EDMA3CC is a write to the trigger word in the PaRAM set pointed to by QCHMAP for a particular QDMA channel. By default, QDMA channels are mapped to PaRAM set 0. You must appropriately re-map PaRAM set 0 before you use it.

Figure 11-14. QDMA Channel to PaRAM Mapping

### 11.3.7 EDMA3 Channel Controller Regions

The EDMA3 channel controller divides its address space into eight regions. Individual channel resources are assigned to a specific region, where each region is typically assigned to a specific EDMA programmer.

You can design the application software to use regions or to ignore them altogether. You can use active memory protection in conjunction with regions so that only a specific EDMA programmer (for example, privilege identification) or privilege level (for example, user vs. supervisor) is allowed access to a given region, and thus to a given DMA or QDMA channel. This allows robust system-level DMA code where each EDMA programmer only modifies the state of the assigned resources. Memory protection is described in [Section 11.3.10](#).

#### 11.3.7.1 Region Overview

The EDMA3 channel controller memory-mapped registers are divided in three main categories:

1. Global registers
2. Global region channel registers
3. Shadow region channel registers

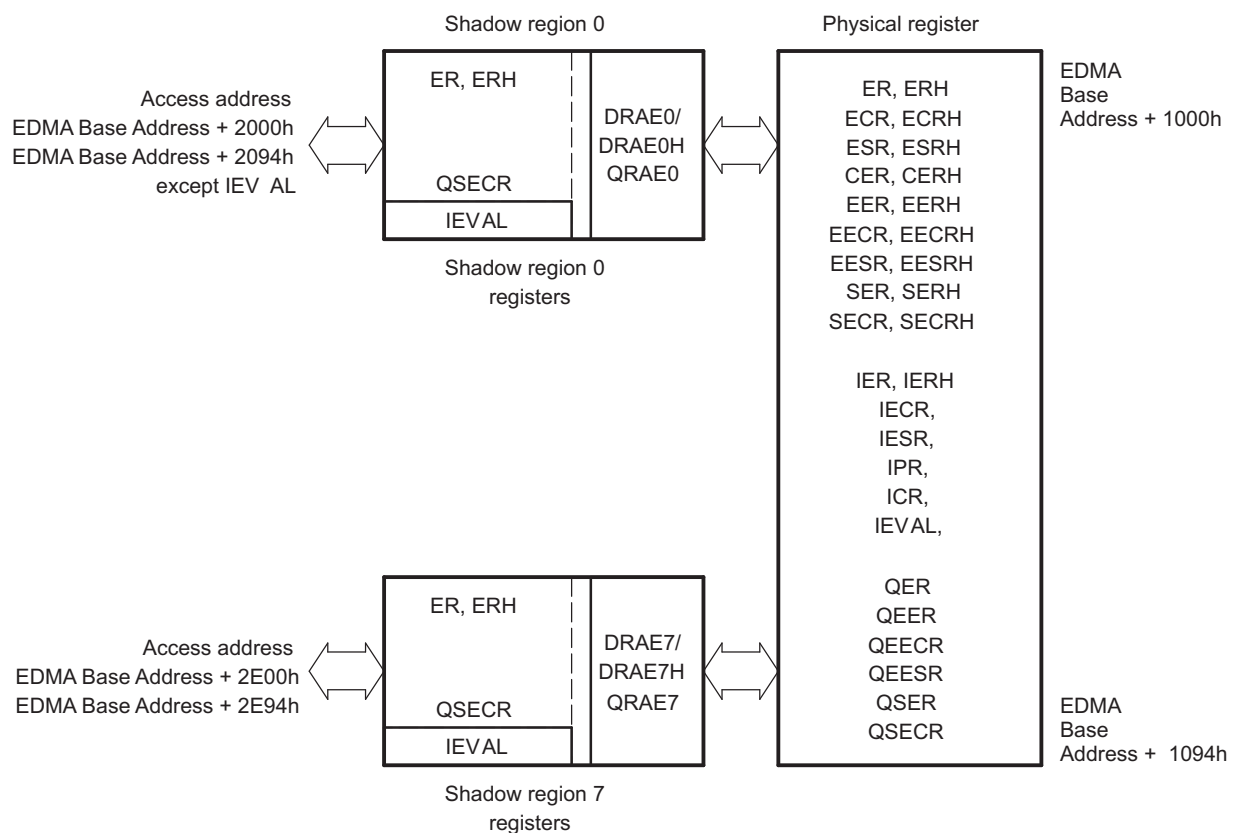

The global registers are located at a single/fixed location in the EDMA3CC memory map. These registers control EDMA3 resource mapping and provide debug visibility and error tracking information.

The channel registers (including DMA, QDMA, and interrupt registers) are accessible via the global channel region address range, or in the shadow *n* channel region address range(s). For example, the event enable register (EER) is visible at the global address of EDMA Base Address + 1020h or region addresses of EDMA Base Address + 2020h for region 0, EDMA Base Address + 2220h for region 1, ... EDMA Base Address + 2E20h for region 7.

The DMA region access enable registers (DRAEm) and the QDMA region access enable registers (QRAEn) control the underlying control register bits that are accessible via the shadow region address space (except for IEVALn). [Table 11-11](#) lists the registers in the shadow region memory map. See the EDMA3CC memory map ([Table 11-25](#)) for the complete global and shadow region memory maps. [Figure 11-15](#) illustrates the conceptual view of the regions.

**Table 11-11. Shadow Region Registers**

$DRAE_m$	$DRAEH_m$	$QRAE_n$

<b>Register not affected by DRAE/DRAEH</b>		
IEVAL		

**Figure 11-15. Shadow Region Registers**

### 11.3.7.2 Channel Controller Regions

There are eight EDMA3 shadow regions (and associated memory maps). Associated with each shadow region are a set of registers defining which channels and interrupt completion codes belong to that region. These registers are user-programmed per region to assign ownership of the DMA/QDMA channels to a region.

- **DRAE $m$  and DRAEH $m$ :** One register pair exists for each of the shadow regions. The number of bits in each register pair matches the number of DMA channels (64 DMA channels). These registers need to be programmed to assign ownership of DMA channels and interrupt (or TCC codes) to the respective region. Accesses to DMA and interrupt registers via the shadow region address view are filtered through the DRAE/DRAEH pair. A value of 1 in the corresponding DRAE(H) bit implies that the corresponding DMA/interrupt channel is accessible; a value of 0 in the corresponding DRAE(H) bit forces writes to be discarded and returns a value of 0 for reads.
- **QRAE $n$ :** One register exists for every region. The number of bits in each register matches the number of QDMA channels (4 QDMA channels). These registers must be programmed to assign ownership of QDMA channels to the respective region. To enable a channel in a shadow region using shadow region 0 QEER, the respective bit in QRAE must be set or writing into QEESR will not have the desired effect.
- **MPPA $n$  and MPPAG:** One register exists for every region. This register defines the privilege level, requestor, and types of accesses allowed to a region's memory-mapped registers.

It is typical for an application to have a unique assignment of QDMA/DMA channels (and, therefore, a given bit position) to a given region.

The use of shadow regions allows for restricted access to EDMA3 resources (DMA channels, QDMA channels, TCC, interrupts) by tasks in a system by setting or clearing bits in the DRAE/ORAE registers. If exclusive access to any given channel / TCC code is required for a region, then only that region's DRAE/ORAE should have the associated bit set.

### Example 11-1. Resource Pool Division Across Two Regions

This example illustrates a judicious resource pool division across two regions, assuming region 0 must be allocated 16 DMA channels (0-15) and 1 QDMA channel (0) and 32 TCC codes (0-15 and 48-63). Region 1 needs to be allocated 16 DMA channels (16-32) and the remaining 7 QDMA channels (1-7) and TCC codes (16-47). DRAE should be equal to the OR of the bits that are required for the DMA channels and the TCC codes:

```
Region 0: DRAEH, DRAE = 0xFFFF0000, 0x0000FFFF QRAE = 0x0000001
Region 1: DRAEH, DRAE = 0x0000FFFF, 0xFFFF0000 QRAE = 0x00000FE
```

#### 11.3.7.3 Region Interrupts

In addition to the EDMA3CC global completion interrupt, there is an additional completion interrupt line that is associated with every shadow region. Along with the interrupt enable register (IER), DRAE acts as a secondary interrupt enable for the respective shadow region interrupts. See [Section 11.3.9](#) for more information.

#### 11.3.8 Chaining EDMA3 Channels

The channel chaining capability for the EDMA3 allows the completion of an EDMA3 channel transfer to trigger another EDMA3 channel transfer. The purpose is to allow you the ability to chain several events through one event occurrence.

Chaining is different from linking ([Section 11.3.3.7](#)). The EDMA3 link feature reloads the current channel parameter set with the linked parameter set. The EDMA3 chaining feature does not modify or update any channel parameter set; it provides a synchronization event to the chained channel (see [Section 11.3.4.1.3](#) for chain-triggered transfer requests).

Chaining is achieved at either final transfer completion or intermediate transfer completion, or both, of the current channel. Consider a channel  $m$  (DMA/QDMA) required to chain to channel  $n$ . Channel number  $n$  (0-63) needs to be programmed into the TCC bit of channel  $m$  channel options parameter (OPT) set.

- If final transfer completion chaining (TCCHEN = 1 in OPT) is enabled, the chain-triggered event occurs after the submission of the last transfer request of channel  $m$  is either submitted or completed (depending on early or normal completion).
- If intermediate transfer completion chaining (ITCCHEN = 1 in OPT) is enabled, the chain-triggered event occurs after every transfer request, except the last of channel  $m$  is either submitted or completed

(depending on early or normal completion).

- If both final and intermediate transfer completion chaining (TCCHEN = 1 and ITCCHEN = 1 in OPT) are enabled, then the chain-trigger event occurs after every transfer request is submitted or completed (depending on early or normal completion).

Table 11-12 illustrates the number of chain event triggers occurring in different synchronized scenarios. Consider channel 31 programmed with ACNT = 3, BCNT = 4, CCNT = 5, and TCC = 30.

**Table 11-12. Chain Event Triggers**

Options	(Number of chained event triggers on channel 30)	
	A-Synchronized	AB-Synchronized
TCCHEN = 1, ITCCHEN = 0	1 (Owing to the last TR)	1 (Owing to the last TR)
TCCHEN = 0, ITCCHEN = 1	19 (Owing to all but the last TR)	4 (Owing to all but the last TR)
TCCHEN = 1, ITCCHEN = 1	20 (Owing to a total of 20 TRs)	5 (Owing to a total of 5 TRs)

### 11.3.9 EDMA3 Interrupts

The EDMA3 interrupts are divided into 2 categories: transfer completion interrupts and error interrupts.

There are nine region interrupts, eight shadow regions and one global region. The transfer completion interrupts are listed in Table 11-13. The transfer completion interrupts and the error interrupts from the transfer controllers are all routed to the ARM interrupt controllers.

**Table 11-13. EDMA3 Transfer Completion Interrupts**

Name	Description
EDMA3CC_INT0	EDMA3CC Transfer Completion Interrupt Shadow Region 0
EDMA3CC_INT1	EDMA3CC Transfer Completion Interrupt Shadow Region 1
EDMA3CC_INT2	EDMA3CC Transfer Completion Interrupt Shadow Region 2
EDMA3CC_INT3	EDMA3CC Transfer Completion Interrupt Shadow Region 3
EDMA3CC_INT4	EDMA3CC Transfer Completion Interrupt Shadow Region 4
EDMA3CC_INT5	EDMA3CC Transfer Completion Interrupt Shadow Region 5
EDMA3CC_INT6	EDMA3CC Transfer Completion Interrupt Shadow Region 6
EDMA3CC_INT7	EDMA3CC Transfer Completion Interrupt Shadow Region 7

**Table 11-14. EDMA3 Error Interrupts**

Name	Description
EDMA3CC_ERRINT	EDMA3CC Error Interrupt
EDMA3CC_MPINT	EDMA3CC Memory Protection Interrupt
EDMA3TC0_ERRINT	TC0 Error Interrupt
EDMA3TC1_ERRINT	TC1 Error Interrupt
EDMA3TC2_ERRINT	TC2 Error Interrupt
EDMA3TC3_ERRINT	TC3 Error Interrupt

#### 11.3.9.1 Transfer Completion Interrupts

The EDMA3CC is responsible for generating transfer completion interrupts to the CPU(s) (and other EDMA3 masters). The EDMA3 generates a single completion interrupt per shadow region, as well as one for the global region on behalf of all 64 channels. The various control registers and bit fields facilitate EDMA3 interrupt generation.

The software architecture should either use the global interrupt or the shadow interrupts, but not both.

The transfer completion code (TCC) value is directly mapped to the bits of the interrupt pending register (IPR/IPRH). For example, if TCC = 10 0001b, IPRH[1] is set after transfer completion, and results in interrupt generation to the CPU(s) if the completion interrupt is enabled for the CPU. See [Section 11.3.9.1.1](#) for details on enabling EDMA3 transfer completion interrupts.

When a completion code is returned (as a result of early or normal completions), the corresponding bit in IPR/IPRH is set if transfer completion interrupt (final/intermediate) is enabled in the channel options parameter (OPT) for a PaRAM set associated with the transfer.

**Table 11-15. Transfer Complete Code (TCC) to EDMA3CC Interrupt Mapping**

TCC Bits in OPT (TCINTEN/ITCINTEN = 1)	IPR Bit Set	TCC Bits in OPT (TCINTEN/ITCINTEN = 1)	IPRH Bit Set <sup>(1)</sup>
0	IPR0	20h	IPR32/IPRH0
1	IPR1	21h	IPR33/IPRH1
2h	IPR2	22h	IPR34/IPRH2
3h	IPR3	23h	IPR35/IPRH3
4h	IPR4	24h	IPR36/IPRH4
...	...	...	...
1Eh	IPR30	3Eh	IPR62/IPRH30
1Fh	IPR31	3Fh	IPR63/IPRH31

<sup>(1)</sup> Bit fields IPR[32-63] correspond to bits 0 to 31 in IPRH, respectively.

You can program the transfer completion code (TCC) to any value for a DMA/QDMA channel. A direct relation between the channel number and the transfer completion code value does not need to exist. This allows multiple channels having the same transfer completion code value to cause a CPU to execute the same interrupt service routine (ISR) for different channels.

If the channel is used in the context of a shadow region and you intend for the shadow region interrupt to be asserted, then ensure that the bit corresponding to the TCC code is enabled in IER/IERH and in the corresponding shadow region's DMA region access registers (DRAE/DRAEH).

You can enable Interrupt generation at either final transfer completion or intermediate transfer completion, or both. Consider channel *m* as an example.

- If the final transfer interrupt (TCCINT = 1 in OPT) is enabled, the interrupt occurs after the last transfer request of channel *m* is either submitted or completed (depending on early or normal completion).
- If the intermediate transfer interrupt (ITCCINT = 1 in OPT) is enabled, the interrupt occurs after every transfer request, except the last TR of channel *m* is either submitted or completed (depending on early or normal completion).
- If both final and intermediate transfer completion interrupts (TCCINT = 1, and ITCCINT = 1 in OPT) are enabled, then the interrupt occurs after every transfer request is submitted or completed (depending on early or normal completion).

[Table 11-16](#) shows the number of interrupts that occur in different synchronized scenarios. Consider channel 31, programmed with ACNT = 3, BCNT = 4, CCNT = 5, and TCC = 30.

**Table 11-16. Number of Interrupts**

Options	A-Synchronized	AB-Synchronized
TCINTEN = 1, ITCINTEN = 0	1 (Last TR)	1 (Last TR)
TCINTEN = 0, ITCINTEN = 1	19 (All but the last TR)	4 (All but the last TR)
TCINTEN = 1, ITCINTEN = 1	20 (All TRs)	5 (All TRs)

### 11.3.9.1.1 Enabling Transfer Completion Interrupts

For the EDMA3 channel controller to assert a transfer completion to the external environment, the interrupts must be enabled in the EDMA3CC. This is in addition to setting up the TCINTEN and ITCINTEN bits in OPT of the associated PaRAM set.

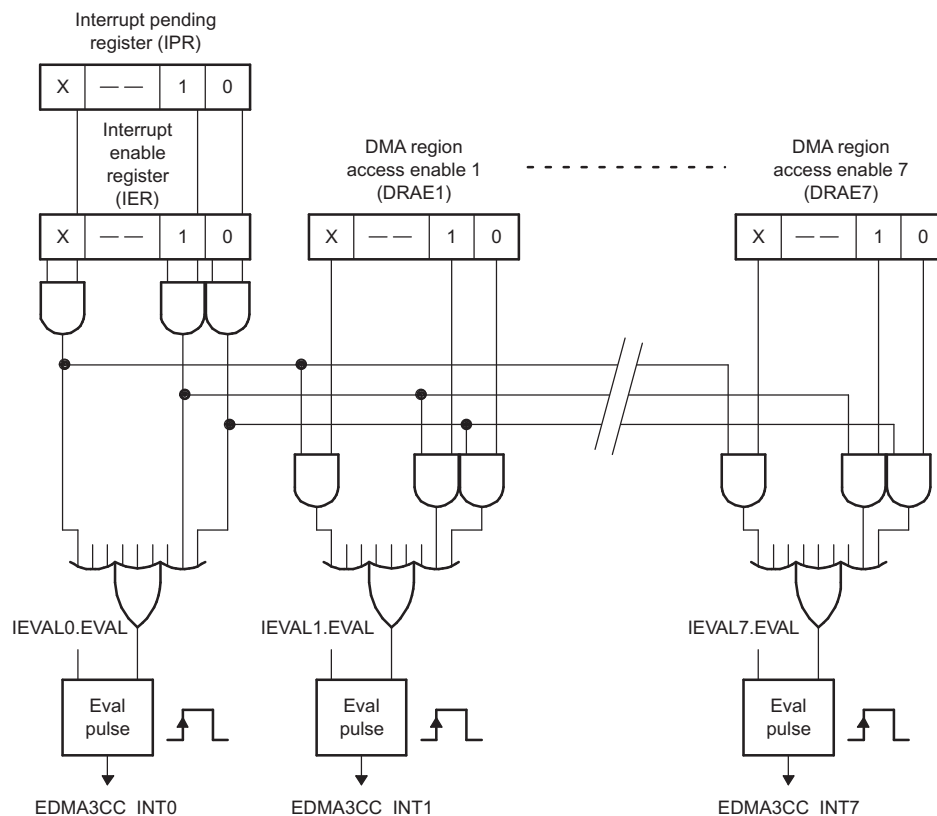

The EDMA3 channel controller has interrupt enable registers (IER/IERH) and each bit location in IER/IERH serves as a primary enable for the corresponding interrupt pending registers (IPR/IPRH).

All of the interrupt registers (IER, IESR, IECR, and IPR) are either manipulated from the global DMA channel region, or by the DMA channel shadow regions. The shadow regions provide a view to the same set of physical registers that are in the global region.

The EDMA3 channel controller has a hierarchical completion interrupt scheme that uses a single set of interrupt pending registers (IPR/IPRH) and single set of interrupt enable registers (IER/IERH). The programmable DMA region access enable registers (DRAE/DRAEH) provides a second level of interrupt masking. The global region interrupt output is gated based on the enable mask that is provided by IER/IERH. see [Figure 11-16](#)

The region interrupt outputs are gated by IER and the specific DRAE/DRAEH associated with the region. See [Figure 11-16](#).

**Figure 11-16. Interrupt Diagram**

For the EDMA3CC to generate the transfer completion interrupts that are associated with each shadow region, the following conditions must be true:

- EDMA3CC\_INT0: (IPR.E0 & IER.E0 & DRAE0.E0) | (IPR.E1 & IER.E1 & DRAE0.E1) | ...|(IPRH.E63 & IERH.E63 & DRAHE0.E63)
- EDMA3CC\_INT1: (IPR.E0 & IER.E0 & DRAE1.E0) | (IPR.E1 & IER.E1 & DRAE1.E1) | ...| (IPRH.E63 & IERH.E63 & DRAHE1.E63)
- EDMA3CC\_INT2 : (IPR.E0 & IER.E0 & DRAE2.E0) | (IPR.E1 & IER.E1 & DRAE2.E1) | ...|(IPRH.E63 & IERH.E63 & DRAHE2.E63)....

- Up to EDMA3CC\_INT7 : (IPR.E0 & IER.E0 & DRAE7.E0) | (IPR.E1 & IER.E1 & DRAE7.E1) | ...|(IPRH.E63 & IERH.E63 & DRAEH7.E63)

**NOTE:** The DRAE/DRAEH for all regions are expected to be set up at system initialization and to remain static for an extended period of time. The interrupt enable registers should be used for dynamic enable/disable of individual interrupts.

Because there is no relation between the TCC value and the DMA/QDMA channel, it is possible, for example, for DMA channel 0 to have the OPT.TCC = 63 in its associated PaRAM set. This would mean that if a transfer completion interrupt is enabled (OPT.TCINTEN or OPT.ITCINTEN is set), then based on the TCC value, IPRH.E63 is set up on completion. For proper channel operations and interrupt generation using the shadow region map, you must program the DRAE/DRAEH that is associated with the shadow region to have read/write access to both bit 0 (corresponding to channel 0) and bit 63 (corresponding to IPRH bit that is set upon completion).

### 11.3.9.1.2 Clearing Transfer Completion Interrupts

Transfer completion interrupts that are latched to the interrupt pending registers (IPR/IPRH) are cleared by writing a 1 to the corresponding bit in the interrupt pending clear register (ICR/ICRH). For example, a write of 1 to ICR.E0 clears a pending interrupt in IPR.E0.

If an incoming transfer completion code (TCC) gets latched to a bit in IPR/IPRH, then additional bits that get set due to a subsequent transfer completion will not result in asserting the EDMA3CC completion interrupt. In order for the completion interrupt to be pulsed, the required transition is from a state where no enabled interrupts are set to a state where at least one enabled interrupt is set.

### 11.3.9.2 EDMA3 Interrupt Servicing

Upon completion of a transfer (early or normal completion), the EDMA3 channel controller sets the appropriate bit in the interrupt pending registers (IPR/IPRH), as the transfer completion codes specify. If the completion interrupts are appropriately enabled, then the CPU enters the interrupt service routine (ISR) when the completion interrupt is asserted.

After servicing the interrupt, the ISR should clear the corresponding bit in IPR/IPRH, thereby enabling recognition of future interrupts. The EDMA3CC will only assert additional completion interrupts when all IPR/IPRH bits clear.

When one interrupt is serviced many other transfer completions may result in additional bits being set in IPR/IPRH, thereby resulting in additional interrupts. Each of the bits in IPR/IPRH may need different types of service; therefore, the ISR may check all pending interrupts and continue until all of the posted interrupts are serviced appropriately.

Examples of pseudo code for a CPU interrupt service routine for an EDMA3CC completion interrupt are shown in [Example 11-2](#) and [Example 11-3](#).

The ISR routine in [Example 11-2](#) is more exhaustive and incurs a higher latency.

#### Example 11-2. Interrupt Servicing

The pseudo code:

1. Reads the interrupt pending register (IPR/IPRH).
2. Performs the operations needed.
3. Writes to the interrupt pending clear register (ICR/ICRH) to clear the corresponding IPR/IPRH bit(s).
4. Reads IPR/IPRH again:
  - (a) If IPR/IPRH is not equal to 0, repeat from step 2 (implies occurrence of new event between step 2 to step 4).
  - (b) If IPR/IPRH is equal to 0, this should assure you that all of the enabled interrupts are inactive.

**Example 11-2. Interrupt Servicing (continued)**

**NOTE:** An event may occur during step 4 while the IPR/IPRH bits are read as 0 and the application is still in the interrupt service routine. If this happens, a new interrupt is recorded in the device interrupt controller and a new interrupt generates as soon as the application exits in the interrupt service routine.

[Example 11-3](#) is less rigorous, with less burden on the software in polling for set interrupt bits, but can occasionally cause a race condition as mentioned above.

**Example 11-3. Interrupt Servicing**

If you want to leave any enabled and pending (possibly lower priority) interrupts; you must force the interrupt logic to reassert the interrupt pulse by setting the EVAL bit in the interrupt evaluation register (IEVAL).

The pseudo code is as follows:

1. Enters ISR.
2. Reads IPR/IPRH.
3. For the condition that is set in IPR/IPRH that you want to service, do the following:
  - (a) Service interrupt as the application requires.
  - (b) Clear the bit for serviced conditions (others may still be set, and other transfers may have resulted in returning the TCC to EDMA3CC after step 2).
4. Reads IPR/IPRH prior to exiting the ISR:
  - (a) If IPR/IPRH is equal to 0, then exit the ISR.
  - (b) If IPR/IPRH is not equal to 0, then set IEVAL so that upon exit of ISR, a new interrupt triggers if any enabled interrupts are still pending.

**11.3.9.3 Interrupt Evaluation Operations**

The EDMA3CC has interrupt evaluate registers (IEVAL) that exist in the global region and in each shadow region. The registers in the shadow region are the only registers in the DMA channel shadow region memory map that are not affected by the settings for the DMA region access enable registers (DRAE/DRAEH). Writing a 1 to the EVAL bit in the registers that are associated with a particular shadow region results in pulsing the associated region interrupt (global or shadow), if any enabled interrupt (via IER/IERH) is still pending (IPR/IPRH). This register assures that the CPU does not miss the interrupts (or the EDMA3 master associated with the shadow region) if the software architecture chooses not to use all interrupts. See [Example 11-3](#) for the use of IEVAL in the EDMA3 interrupt service routine (ISR).

Similarly an error evaluation register (EEVAL) exists in the global region. Writing a 1 to the EVAL bit in EEVAL causes the pulsing of the error interrupt if any pending errors are in EMR/EMRH, QEMR, or CCERR. See [Section 11.3.9.4](#) for additional information regarding error interrupts.

**NOTE:** While using IEVAL for shadow region completion interrupts, you should make sure that the IEVAL operated upon is from that particular shadow region memory map.

### 11.3.9.4 Error Interrupts

The EDMA3CC error registers provide the capability to differentiate error conditions (event missed, threshold exceed, etc.). Additionally, setting the error bits in these registers results in asserting the EDMA3CC error interrupt. If the EDMA3CC error interrupt is enabled in the device interrupt controller(s), then it allows the CPU(s) to handle the error conditions.

The EDMA3CC has a single error interrupt (EDMA3CC\_ERRINT) that is asserted for all EDMA3CC error conditions. There are four conditions that cause the error interrupt to pulse:

- DMA missed events: for all 64 DMA channels. DMA missed events are latched in the event missed registers (EMR/EMRH).
- QDMA missed events: for all 8 QDMA channels. QDMA missed events are latched in the QDMA event missed register (QEMR).
- Threshold exceed: for all event queues. These are latched in EDMA3CC error register (CCERR).
- TCC error: for outstanding transfer requests that are expected to return completion code (TCCHEN or TCINTEN bit in OPT is set to 1) exceeding the maximum limit of 63. This is also latched in the EDMA3CC error register (CCERR).

Figure 11-17 illustrates the EDMA3CC error interrupt generation operation.

If any of the bits are set in the error registers due to any error condition, the EDMA3CC\_ERRINT is always asserted, as there are no enables for masking these error events. Similar to transfer completion interrupts (EDMA3CC\_INT), the error interrupt also only pulses when the error interrupt condition transitions from no errors being set to at least one error being set. If additional error events are latched prior to the original error bits clearing, the EDMA3CC does not generate additional interrupt pulses.

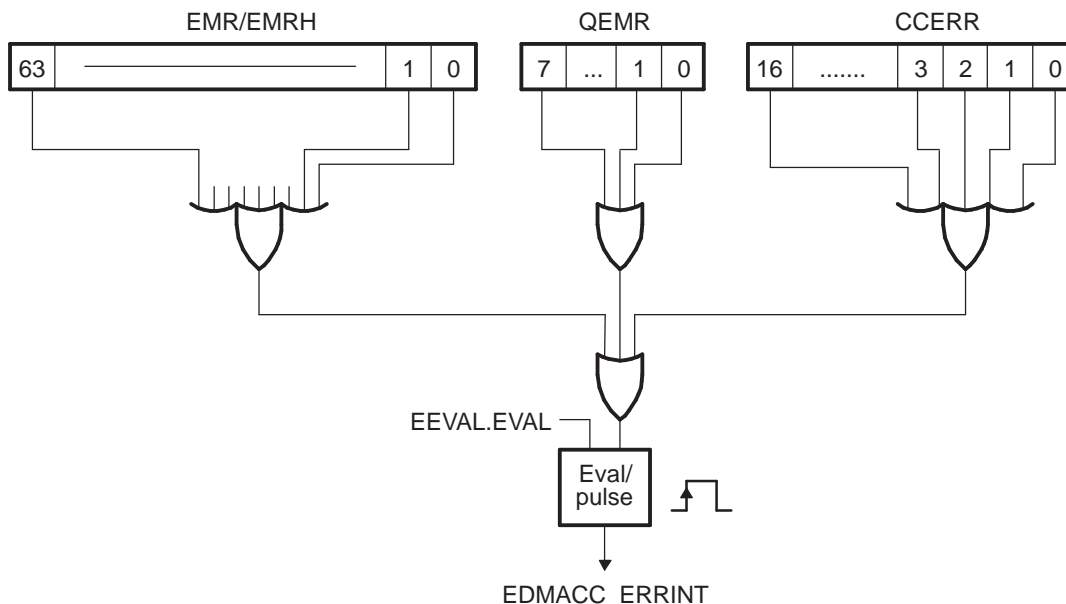

To reduce the burden on the software, there is an error evaluate register (EEVAL) that allows re-evaluation of pending set error events/bits, similar to the interrupt evaluate register (IEVAL). You can use this so that the CPU(s) does not miss any error events.

---

**NOTE:** It is good practice to enable the error interrupt in the device interrupt controller and to associate an interrupt service routine with it to address the various error conditions appropriately. Doing so puts less burden on the software (polling for error status); additionally, it provides a good debug mechanism for unexpected error conditions.

---

Figure 11-17. Error Interrupt Operation

### 11.3.10 Memory Protection

The EDMA3 channel controller supports two kinds of memory protection: active and proxy.

#### 11.3.10.1 Active Memory Protection

Active memory protection is a feature that allows or prevents read and write accesses (by any EDMA3 programmer) to the EDMA3CC registers (based on permission characteristics that you program). Active memory protection is achieved by a set of memory protection permissions attribute (MPPA) registers.

The EDMA3CC register map is divided into three categories:

- a global region.
- a global channel region.
- eight shadow regions.

Each shadow region consists of the respective shadow region registers and the associated PaRAM. For more detailed information regarding the contents of a shadow region, refer to section [Table 11-11](#).

Each of the eight shadow regions has an associated MPPA register (MPPA $n$ ) that defines the specific requestor(s) and types of requests that are allowed to the regions resources.

The global channel region is also protected with a memory-mapped register (MPPAG). The MPPAG applies to the global region and to the global channel region, except the other MPPA registers themselves. For more detailed information on the list of the registers in each region, refer to the register memory-map in section [Table 11-18](#).

See [Section 11.4.1.5.4](#) for the bit field descriptions of MPPA $n$ . The MPPA $n$  have a certain set of access rules.

[Table 11-17](#) shows the accesses that are allowed or not allowed to the MPPAG and MPPA $n$ . The active memory protection uses the PRIV and PRIVID attributes of the EDMA programmer. The PRIV is the privilege level (i.e., user vs. supervisor). The PRIVID refers to a privilege ID with a number that is associated with an EDMA3 programmer. See the device-specific data manual for the PRIVIDs that are associated with potential EDMA3 programmers.

**Table 11-17. Allowed Accesses**

Access	Supervisor	User
Read	Yes	Yes
Write	Yes	No

[Table 11-18](#) describes the MPPA register mapping for the shadow regions (which includes shadow region registers and PaRAM addresses).

The region-based MPPA registers are used to protect accesses to the DMA shadow regions and the associated region PaRAM. Because there are eight regions, there are eight MPPA region registers (MPPA[0-7]).

**Table 11-18. MPPA Registers to Region Assignment**

Register	Registers Protect	Address Range	PaRAM Protect <sup>(1)</sup>	Address Range
MPPAG	Global Range	0000h-1FFCh	N/A	N/A
MPPA0	DMA Shadow 0	2000h-21FCh	1st octant	4000h-47FCh
MPPA1	DMA Shadow 1	2200h-23FCh	2nd octant	4800h-4FFCh
MPPA2	DMA Shadow 2	2400h-25FCh	3rd octant	5000h-57FCh
MPPA3	DMA Shadow 3	2600h-27FCh	4th octant	5800h-5FFCh
MPPA4	DMA Shadow 4	2800h-29FCh	5th octant	6000h-67FCh
MPPA5	DMA Shadow 5	2A00h-2BFCh	6th octant	6800h-6FFCh
MPPA6	DMA Shadow 6	2C00h-2DFCh	7th octant	7000h-77FCh
MPPA7	DMA Shadow 7	2E00h-2FFCh	8th octant	7800h-7FFCh

<sup>(1)</sup> The PARAM region is divided into 8 regions referred to as an octant.

Example Access denied.

Write access to shadow region 7's event enable set register (EESR):

1. The original value of the event enable register (EER) at address offset 0x1020 is 0x0.
2. The MPPA[7] is set to prevent user level accesses (UW = 0, UR = 0), but it allows supervisor level accesses (SW = 1, SR = 1) with a privilege ID of 0. (AID0 = 1).
3. An EDMA3 programmer with a privilege ID of 0 attempts to perform a user-level write of a value of 0xFF00FF00 to shadow region 7's event enable set register (EESR) at address offset 0x2E30. Note that the EER is a read-only register and the only way that you can write to it is by writing to the EESR. Also remember that there is only one physical register for EER, EESR, etc. and that the shadow regions only provide to the same physical set.
4. Since the MPPA[7] has UW = 0, though the privilege ID of the write access is set to 0, the access is not allowed and the EER is not written to.

**Table 11-19. Example Access Denied**

Register	Value	Description
EER (offset 0x1020)	0x0000 0000	Value in EER to begin with.
EESR (offset 0x2E30)	0xFF00 FF00 ↓	Value attempted to be written to shadow region 7's EESR. This is done by an EDMA3 programmer with a privilege level of User and Privilege ID of 0.
MPPA[7] (offset 0x082C)	0x0000 04B0	Memory Protection Filter AID0 = 1, UW = 0, UR = 0, SW = 1, SR = 1.
	X	Access Denied
EER (offset 0x1020)	0x0000 0000	Final value of EER

Example Access Allowed

Write access to shadow region 7's event enable set register (EESR):

1. The original value of the event enable register (EER) at address offset 0x1020 is 0x0.
2. The MPPA[7] is set to allow user-level accesses (UW = 1, UR = 1) and supervisor-level accesses (SW = 1, SR = 1) with a privilege ID of 0. (AID0 = 1).
3. An EDMA3 programmer with a privilege ID of 0, attempts to perform a user-level write of a value of 0xABCD0123 to shadow region 7's event enable set register (EESR) at address offset 0x2E30. Note that the EER is a read-only register and the only way that you can write to it is by writing to the EESR. Also remember that there is only one physical register for EER, EESR, etc. and that the shadow regions only provide to the same physical set.
4. Since the MPPA[7] has UW = 1 and AID0 = 1, the user-level write access is allowed.
5. Remember that accesses to shadow region registers are masked by their respective DRAE register. In this example, the DRAE[7] is set of 0x9FF00FC2.
6. The value finally written to EER is 0x8BC00102.

**Table 11-20. Example Access Allowed**

Register	Value	Description
EER (offset 0x1020)	0x0000 0000	Value in EER to begin with.
EESR (offset 0x2E30)	0xFF00 FF00	Value attempted to be written to shadow region 7's EESR. This is done by an EDMA3 programmer with a privilege level of User and Privilege ID of 0.
MPPA[7] (offset 0x082C)	0x0000 04B3	Memory Protection Filter AID = 1, UW = 1, UR = 1, SW = 1, SR = 1.
	√ ↓	Access allowed.
DRAE[7] (offset 0x0378)	0x9FF0 0FC2	DMA Region Access Enable Filter
	↓	
EESR (offset 0x2E30)	0x8BC0 0102	Value written to shadow region 7's EESR. This is done by an EDMA3 programmer with a privilege level of User and a Privilege ID of 0.
	↓	
EER (offset 0x1020)	0xBC0 0102	Final value of EER.

### 11.3.10.2 Proxy Memory Protection

Proxy memory protection allows an EDMA3 transfer programmed by a given EDMA3 programmer to have its permissions travel with the transfer through the EDMA3TC. The permissions travel along with the read transactions to the source and the write transactions to the destination endpoints. The PRIV bit and PRIVID bit in the channel options parameter (OPT) is set with the EDMA3 programmer's PRIV value and PRIVID values, respectively, when any part of the PaRAM set is written.

The PRIV is the privilege level (i.e., user vs. supervisor). The PRIVID refers to a privilege ID with a number that is associated with an EDMA3 programmer.

See the data manual for the PRIVIDs that are associated with potential EDMA3 programmers.

These options are part of the TR that are submitted to the transfer controller. The transfer controller uses the above values on their respective read and write command bus so that the target endpoints can perform memory protection checks based on these values.

Consider a parameter set that is programmed by a CPU in user privilege level for a simple transfer with the source buffer on an L2 page and the destination buffer on an L1D page. The PRIV is 0 for user-level and the CPU has a PRIVID of 0.

The PaRAM set is shown in [Figure 11-18](#).

**Figure 11-18. PaPARAM Set Content for Proxy Memory Protection Example**

(a) EDMA3 Parameters

Parameter Contents		Parameter	
0010 0007h		Channel Options Parameter (OPT)	
009F 0000h		Channel Source Address (SRC)	
0001h	0004h	Count for 2nd Dimension (BCNT)	Count for 1st Dimension (ACNT)
00F0 7800h		Channel Destination Address (DST)	
0001h	0001h	Destination BCNT Index (DSTBIDX)	Source BCNT Index (SRCBIDX)
0000h	FFFFh	BCNT Reload (BCNTRLD)	Link Address (LINK)
0001h	1000h	Destination CCNT Index (DSTCIDX)	Source CCNT Index (SRCCIDX)
0000h	0001h	Reserved	Count for 3rd Dimension (CCNT)

**Figure 11-19. Channel Options Parameter (OPT) Example**

(b) Channel Options Parameter (OPT) Content

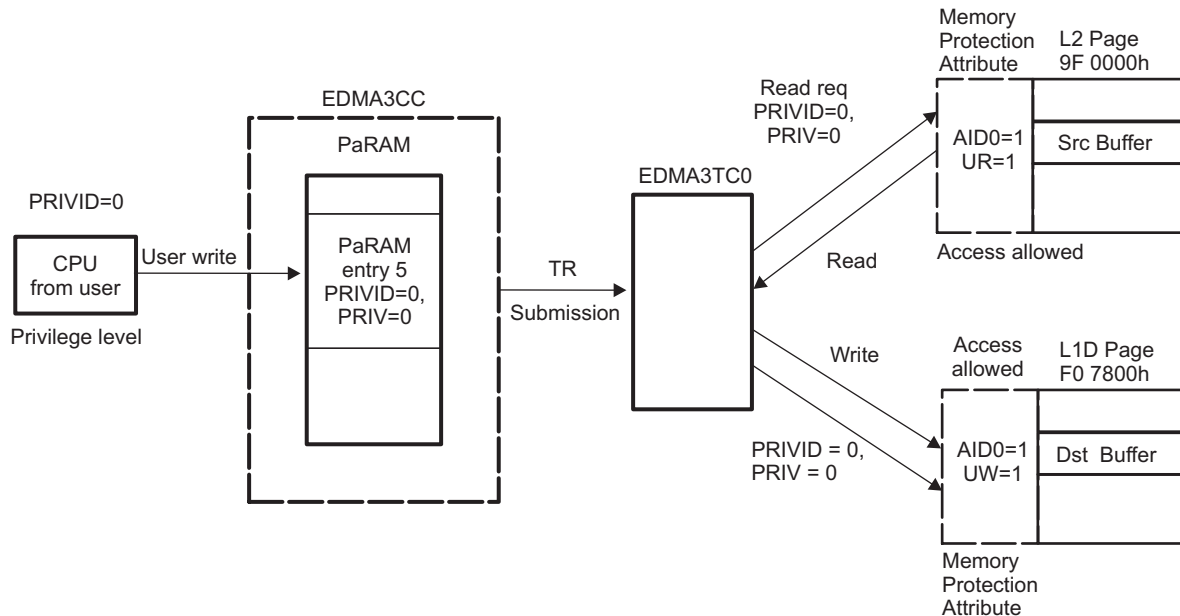

The PRIV and PRIVID information travels along with the read and write requests that are issued to the source and destination memories.

For example, if the access attributes that are associated with the L2 page with the source buffer only allow supervisor read, write accesses (SR,SW), the user-level read request above is refused. Similarly, if the access attributes that are associated with the L1D page with the destination buffer only allow supervisor read and write accesses (SR, SW), the user-level write request above is refused. For the transfer to succeed, the source and destination pages should have user-read and user-write permissions, respectively, along with allowing accesses from a PRIVID 0.

Because the programmer's privilege level and privilege identification travel with the read and write requests, EDMA3 acts as a proxy.

Figure 11-20 illustrates the propagation of PRIV and PRIVID at the boundaries of all the interacting entities (CPU, EDMA3CC, EDMA3TC, and slave memories).

**Figure 11-20. Proxy Memory Protection Example**

### 11.3.11 Event Queue(s)

Event queues are a part of the EDMA3 channel controller. Event queues form the interface between the event detection logic in the EDMA3CC and the transfer request (TR) submission logic of the EDMA3CC. Each queue is 16 entries deep; thus, each event queue can queue a maximum of 16 events. If there are more than 16 events, then the events that cannot find a place in the event queue remain set in the associated event register and the CPU does not stall.

There are four event queues for the device: Queue0, Queue1, Queue2, and Queue3. Events in Queue0 result in submission of its associated transfer requests (TRs) to TC0. Similarly, transfer requests that are associated with events in Queue3 are submitted to TC3.

An event that wins prioritization against other DMA and/or QDMA pending events is placed at the tail of the appropriate event queue. Each event queue is serviced in FIFO order. Once the event reaches the head of its queue and the corresponding transfer controller is ready to receive another TR, the event is de-queued and the PaRAM set corresponding to the de-queued event is processed and submitted as a transfer request packet (TRP) to the associated EDMA3 transfer controller.

Queue0 has highest priority and Queue3 has the lowest priority, if Queue0 and Queue1 both have at least one event entry and if both TC0 and TC1 can accept transfer requests, then the event in Queue0 is de-queued first and its associated PaRAM set is processed and submitted as a transfer request (TR) to TC0.

See [Section 11.3.11.4](#) for system-level performance considerations. All of the event entries in all of the event queues are software readable (not writeable) by accessing the event entry registers (Q0E0, Q0E1, ..., Q1E15, etc.). Each event entry register characterizes the queued event in terms of the type of event (manual, event, chained or auto-triggered) and the event number. See [Section 11.4.1.4.1](#) for a description of the bit fields in the queue event entry registers.

#### 11.3.11.1 DMA/QDMA Channel to Event Queue Mapping

Each of the 64 DMA channels and eight QDMA channels are programmed independently to map to a specific queue, using the DMA queue number register (DMAQNUM) and the QDMA queue number register (QDMANUM). The mapping of DMA/QDMA channels is critical to achieving the desired performance level for the EDMA and most importantly, in meeting real-time deadlines. See [Section 11.3.11.4](#).

---

**NOTE:** If an event is ready to be queued and both the event queue and the EDMA3 transfer controller that is associated to the event queue are empty, then the event bypasses the event queue, and moves the PaRAM processing logic, and eventually to the transfer request submission logic for submission to the EDMA3TC. In this case, the event is not logged in the event queue status registers.

---

### 11.3.11.2 Queue RAM Debug Visibility

There are four event queues and each queue has 16 entries. These 16 entries are managed in a circular FIFO manner. There is a queue status register (QSTAT) associated with each queue. These along with all of the 16 entries per queue can be read via registers QSTAT $n$  and QxEy, respectively.

These registers provide user visibility and may be helpful while debugging real-time issues (typically post-mortem), involving multiple events and event sources. The event queue entry register (QxEy) uniquely identifies the specific event type (event-triggered, manually-triggered, chain-triggered, and QDMA events) along with the event number (for all DMA/QDMA event channels) that are in the queue or have been de-queued (passed through the queue).

Each of the 16 entries in the event queue are read using the EDMA3CC memory-mapped register. By reading the event queue, you see the history of the last 16 TRs that have been processed by the EDMA3 on a given queue. This provides user/software visibility and is helpful for debugging real-time issues (typically post-mortem), involving multiple events and event sources.

The queue status register (QSTAT $n$ ) includes fields for the start pointer (STRTPTR) which provides the offset to the head entry of an event. It also includes a field called NUMVAL that provides the total number of valid entries residing in the event queue at a given instance of time. The STRTPTR may be used to index appropriately into the 16 event entries. NUMVAL number of entries starting from STRTPTR are indicative of events still queued in the respective queue. The remaining entry may be read to determine what's already de-queued and submitted to the associated transfer controller.

### 11.3.11.3 Queue Resource Tracking

The EDMA3CC event queue includes watermarking/threshold logic that allows you to keep track of maximum usage of all event queues. This is useful for debugging real-time deadline violations that may result from head-of-line blocking on a given EDMA3 event queue.

You can program the maximum number of events that can queue up in an event queue by programming the threshold value (between 0 to 15) in the queue watermark threshold A register (QWMTHRA). The maximum queue usage is recorded actively in the watermark (WM) field of the queue status register (QSTAT $n$ ) that keeps getting updated based on a comparison of number of valid entries, which is also visible in the NUMVAL bit in QSTAT $n$  and the maximum number of entries (WM bit in QSTAT $n$ ).

If the queue usage is exceeded, this status is visible in the EDMA3CC registers: the QTHRXCDC $n$  bit in the channel controller error register (CCERR) and the THRXCDC bit in QSTAT $n$ , where  $n$  stands for the event queue number. Any bits that are set in CCERR also generate an EDMA3CC error interrupt.

### 11.3.11.4 Performance Considerations

The main system bus infrastructure (L3) arbitrates bus requests from all of the masters (TCs, CPU(S), and other bus masters) to the shared slave resources (peripherals and memories).

The priorities of transfer requests (read and write commands) from the EDMA3 transfer controllers with respect to other masters within the system crossbar are programmed using the queue priority register (QUEPRI). QUEPRI programs the priority of the event queues (or indirectly, TC0-TC3, because Queue $N$  transfer requests are submitted to TCM).

Therefore, the priority of unloading queues has a secondary affect compared to the priority of the transfers as they are executed by the EDMA3TC (dictated by the priority set using QUEPRI).

### 11.3.12 EDMA3 Transfer Controller (EDMA3TC)

The EDMA3 channel controller is the user-interface of the EDMA3 and the EDMA3 transfer controller (EDMA3TC) is the data movement engine of the EDMA3. The EDMA3CC submits transfer requests (TR) to the EDMA3TC and the EDMA3TC performs the data transfers dictated by the TR; thus, the EDMA3TC is a slave to the EDMA3CC.

#### 11.3.12.1 Architecture Details

##### 11.3.12.1.1 Command Fragmentation

The TC read and write controllers in conjunction with the source and destination register sets are responsible for issuing optimally-sized reads and writes to the slave endpoints. An optimally-sized command is defined by the transfer controller default burst size (DBS), which is defined in [Section 11.3.12.5](#).

The EDMA3TC attempts to issue the largest possible command size as limited by the DBS value or the ACNT/BCNT value of the TR. EDMA3TC obeys the following rules:

- The read/write controllers always issue commands less than or equal to the DBS value.
- The first command of a 1D transfer command always aligns the address of subsequent commands to the DBS value.

[Table 11-21](#) lists the TR segmentation rules that are followed by the EDMA3TC. In summary, if the ACNT value is larger than the DBS value, then the EDMA3TC breaks the ACNT array into DBS-sized commands to the source/destination addresses. Each BCNT number of arrays are then serviced in succession.

For BCNT arrays of ACNT bytes (that is, a 2D transfer), if the ACNT value is less than or equal to the DBS value, then the TR may be optimized into a 1D-transfer in order to maximize efficiency. The optimization takes place if the EDMA3TC recognizes that the 2D-transfer is organized as a single dimension (ACNT == BIDX) and the ACNT value is a power of 2.

[Table 11-21](#) lists conditions in which the optimizations are performed.

**Table 11-21. Read/Write Command Optimization Rules**

ACNT ≤ DBS	ACNT is power of 2	BIDX = ACNT	BCNT ≤ 1023	SAM/DAM = Increment	Description
Yes	Yes	Yes	Yes	Yes	Optimized
No	x	x	x	x	Not Optimized
x	No	x	x	x	Not Optimized
x	x	No	x	x	Not Optimized
x	x	x	No	x	Not Optimized
x	x	x	x	No	Not Optimized

##### 11.3.12.1.2 TR Pipelining

TR pipelining refers to the ability of the source active set to proceed ahead of the destination active set. Essentially, the reads for a given TR may already be in progress while the writes of a previous TR may not have completed.

The number of outstanding TRs is limited by the number of destination FIFO register entries.

TR pipelining is useful for maintaining throughput on back-to-back small TRs. It minimizes the startup overhead because reads start in the background of a previous TR writes.

**Example 11-4. Command Fragmentation (DBS = 64)**

The pseudo code:

1. ACNT = 8, BCNT = 8, SRCBIDX = 8, DSTBIDX = 10, SRCADDR = 64, DSTADDR = 191

Read Controller: This is optimized from a 2D-transfer to a 1D-transfer such that the read side is equivalent to ACNT = 64, BCNT = 1.

Cmd0 = 64 byte

Write Controller: Because DSTBIDX != ACNT, it is not optimized.

Cmd0 = 8 byte, Cmd1 = 8 byte, Cmd2 = 8 byte, Cmd3 = 8 byte, Cmd4 = 8 byte, Cmd5 = 8 byte, Cmd6 = 8 byte, Cmd7 = 8 byte.

2. ACNT=128, BCNT = 1, SRCADDR = 63, DSTADDR = 513

Read Controller: Read address is not aligned.

Cmd0 = 1 byte, (now the SRCADDR is aligned to 64 for the next command)

Cmd1 = 64 bytes

Cmd2 = 63 bytes

Write Controller: The write address is also not aligned.

Cmd0 = 63 bytes, (now the DSTADDR is aligned to 64 for the next command)

Cmd1 = 64 bytes

Cmd2 = 1 byte

**11.3.12.1.3 Performance Tuning**

By default, reads are as issued as fast as possible. In some cases, the reads issued by the EDMA3TC could fill the available command buffering for a slave, delaying other (potentially higher priority) masters from successfully submitting commands to that slave. The rate at which read commands are issued by the EDMA3TC is controlled by the RDRATE register. The RDRATE register defines the number of cycles that the EDMA3TC read controller waits before issuing subsequent commands for a given TR, thus minimizing the chance of the EDMA3TC consuming all available slave resources. The RDRATE value should be set to a relatively small value if the transfer controller is targeted for high priority transfers and to a higher value if the transfer controller is targeted for low priority transfers.

In contrast, the Write Interface does not have any performance turning knobs because writes always have an interval between commands as write commands are submitted along with the associated write data.

**11.3.12.2 Memory Protection**

The transfer controller plays an important role in handling proxy memory protection. There are two access properties associated with a transfer: for instance, the privilege id (system-wide identification assigned to a master) of the master initiating the transfer, and the privilege level (user versus supervisor) used to program the transfer. This information is maintained in the PaRAM set when it is programmed in the channel controller. When a TR is submitted to the transfer controller, this information is made available to the EDMA3TC and used by the EDMA3TC while issuing read and write commands. The read or write commands have the same privilege identification, and privilege level as that programmed in the EDMA3 transfer in the channel controller.

**11.3.12.3 Error Generation**

Errors are generated if enabled under three conditions:

- EDMA3TC detection of an error signaled by the source or destination address.
- Attempt to read or write to an invalid address in the configuration memory map.
- Detection of a constant addressing mode TR violating the constant addressing mode transfer rules (the source/destination addresses and source/destination indexes must be aligned to 32 bytes).

Either or all error types may be disabled. If an error bit is set and enabled, the error interrupt for the concerned transfer controller is pulsed.

#### 11.3.12.4 Debug Features

The DMA program register set, DMA source active register set, and the destination FIFO register set are used to derive a brief history of TRs serviced through the transfer controller.

Additionally, the EDMA3TC status register (TCSTAT) has dedicated bit fields to indicate the ongoing activity within different parts of the transfer controller:

- The SRCACTV bit indicates whether the source active set is active.
- The DSTACTV bit indicates the number of TRs resident in the destination register active set at a given instance.
- The PROGBUSY bit indicates whether a valid TR is present in the DMA program set.

If the TRs are in progression, caution must be used and you must realize that there is a chance that the values read from the EDMA3TC status registers will be inconsistent since the EDMA3TC may change the values of these registers due to ongoing activities.

It is recommended that you ensure no additional submission of TRs to the EDMA3TC in order to facilitate ease of debug.

##### 11.3.12.4.1 Destination FIFO Register Pointer

The destination FIFO register pointer is implemented as a circular buffer with the start pointer being DFSTRTPTR and a buffer depth of usually 2 or 4. The EDMA3TC maintains two important status details in TCSTAT that may be used during advanced debugging, if necessary. The DFSTRTPTR is a start pointer, that is, the index to the head of the destination FIFO register. The DSTACTV is a counter for the number of valid (occupied) entries. These registers may be used to get a brief history of transfers.

Examples of some register field values and their interpretation:

- DFSTRTPTR = 0 and DSTACTV = 0 implies that no TRs are stored in the destination FIFO register.
- DFSTRTPTR = 1 and DSTACTV = 2h implies that two TRs are present. The first pending TR is read from the destination FIFO register entry 1 and the second pending TR is read from the destination FIFO register entry 2.
- DFSTRTPTR = 3h and DSTACTV = 2h implies that two TRs are present. The first pending TR is read from the destination FIFO register entry 3 and the second pending TR is read from the destination FIFO register entry 0.

#### 11.3.12.5 EDMA3TC Configuration

[Table 11-22](#) provides the configuration of the individual EDMA3 transfer controllers present on the device. The default burst size (DBS) for each transfer controller is configurable using the TPTC\_CFG register in the control module.

**Table 11-22. EDMA3 Transfer Controller Configurations**

Name	TC0	TC1	TC2	TC3
FIFOSIZE	512 bytes	512 bytes	512 bytes	512 bytes
BUSWIDTH	16 bytes	16 bytes	16 bytes	16 bytes
DSTREGDEPTH	4 entries	4 entries	4 entries	4 entries
DBS	Configurable	Configurable	Configurable	Configurable

### 11.3.13 Event Dataflow

This section summarizes the data flow of a single event, from the time the event is latched to the channel controller to the time the transfer completion code is returned. The following steps list the sequence of EDMA3CC activity:

1. Event is asserted from an external source (peripheral or external interrupt). This also is similar for a manually-triggered, chained-triggered, or QDMA-triggered event. The event is latched into the ER.En/ERH.En (or CER.En/CERH.En, ESR.En/ESRH.En, QER.En) bit.
2. Once an event is prioritized and queued into the appropriate event queue, the SER.En/SERH.En (or QSER.En) bit is set to inform the event prioritization/processing logic to disregard this event since it is already in the queue. Alternatively, if the transfer controller and the event queue are empty, then the event bypasses the queue.
3. The EDMA3CC processing and the submission logic evaluates the appropriate PaRAM set and determines whether it is a non-null and non-dummy transfer request (TR).
4. The EDMA3CC clears the ER.En/ERH.En (or CER.En/CERH.En, ESR.En/ESRH.En, QER.En) bit and the SER.En/SERH.En bit as soon as it determines the TR is non-null. In the case of a null set, the SER.En/SERH.En bit remains set. It submits the non-null/non-dummy TR to the associated transfer controller. If the TR was programmed for early completion, the EDMA3CC immediately sets the interrupt pending register (IPR.I[TCC]/IPRH.I[TCC]-32).
5. If the TR was programmed for normal completion, the EDMA3CC sets the interrupt pending register (IPR.I[TCC]/IPRH.I[TCC]) when the EDMA3TC informs the EDMA3CC about completion of the transfer (returns transfer completion codes).
6. The EDMA3CC programs the associated EDMA3TCn's Program Register Set with the TR.
7. The TR is then passed to the Source Active set and the DST FIFO Register Set, if both the register sets are available.
8. The Read Controller processes the TR by issuing read commands to the source slave endpoint. The Read Data lands in the Data FIFO of the EDMA3TCn.
9. As soon as sufficient data is available, the Write Controller begins processing the TR by issuing write commands to the destination slave endpoint.
10. This continues until the TR completes and the EDMA3TCn then signals completion status to the EDMA3CC.

### 11.3.14 EDMA3 Prioritization

The EDMA3 controller has many implementation rules to deal with concurrent events/channels, transfers, etc. The following subsections detail various arbitration details whenever there might be occurrence of concurrent activity. [Figure 11-21](#) shows the different places EDMA3 priorities come into play.

#### 11.3.14.1 Channel Priority

The DMA event registers (ER and ERH) capture up to 64 events; likewise, the QDMA event register (QER) captures QDMA events for all QDMA channels; therefore, it is possible for events to occur simultaneously on the DMA/QDMA event inputs. For events arriving simultaneously, the event associated with the lowest channel number is prioritized for submission to the event queues (for DMA events, channel 0 has the highest priority and channel 63 has the lowest priority; similarly, for QDMA events, channel 0 has the highest priority and channel 7 has the lowest priority). This mechanism only sorts simultaneous events for submission to the event queues.

If a DMA and QDMA event occurs simultaneously, the DMA event always has prioritization against the QDMA event for submission to the event queues.

### 11.3.14.2 Trigger Source Priority

If a DMA channel is associated with more than one trigger source (event trigger, manual trigger, and chain trigger), and if multiple events are set simultaneously for the same channel ( $ER.En = 1$ ,  $ESR.En = 1$ ,  $CER.En = 1$ ), then the EDMA3CC always services these events in the following priority order: event trigger (via ER) is higher priority than chain trigger (via CER) and chain trigger is higher priority than manual trigger (via ESR).

This implies that if for channel 0, both  $ER.E0 = 1$  and  $CER.E0 = 1$  at the same time, then the  $ER.E0$  event is always queued before the  $CER.E0$  event.

### 11.3.14.3 Dequeue Priority

The priority of the associated transfer request (TR) is further mitigated by which event queue is being used for event submission (dictated by DMAQNUM and QDMAQNUM). For submission of a TR to the transfer request, events need to be de-queued from the event queues. Queue 0 has the highest dequeue priority and queue 3 the lowest.

### 11.3.14.4 System (Transfer Controller) Priority

INIT\_PRIORITY\_0 and INIT\_PRIORITY\_1 registers in the chip configuration module are used to configure the EDMA TC's priority through the system bus infrastructure. Additionally, the priority settings for DDR memory accesses are defined in the dynamic memory manager (DMM).

---

**NOTE:** The default priority for all TCs is the same, 0 or highest priority relative to other masters. It is recommended that this priority be changed based on system level considerations, such as real-time deadlines for all masters including the priority of the transfer controllers with respect to each other.

---

### 11.3.15 EDMA3 Operating Frequency (Clock Control)

The EDMA3 channel controller and transfer controller are clocked from PLL\_L3 SYSCLK4. The EDMA3 system runs at the L3 clock frequency.

### 11.3.16 Reset Considerations

A hardware reset resets the EDMA3 (EDMA3CC and EDMA3TC) and the EDMA3 configuration registers. The PaRAM memory contents are undefined after device reset and you should not rely on parameters to be reset to a known state. The PaRAM entry must be initialized to a desired value before it is used.

### 11.3.17 Power Management

The EDMA3 (EDMA3CC and EDMA3TC) can be placed in reduced-power modes to conserve power during periods of low activity. The power management of the peripheral is controlled by the power reset clock management (PRCM). The PRCM acts as a master controller for power management for all peripherals on the device.

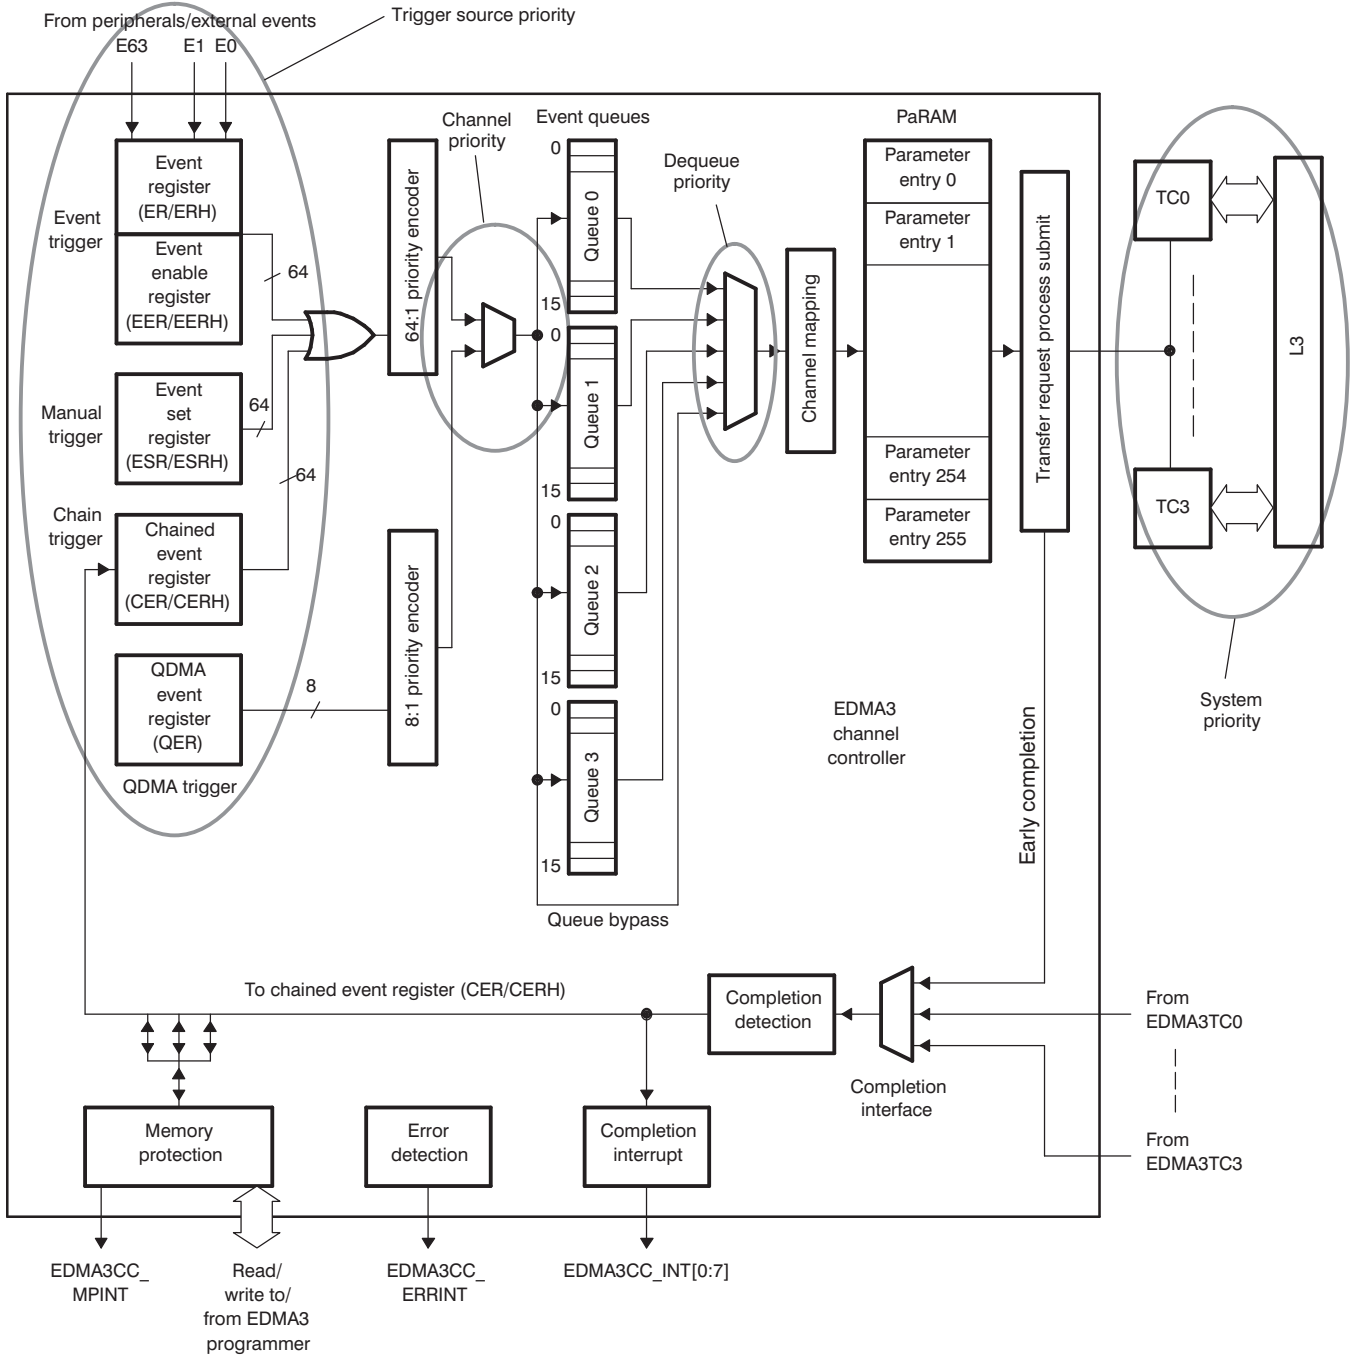

The EDMA3 controller can be idled on receiving a clock stop request from the PRCM. The requests to EDMA3CC and EDMA3TC are separate. In general, it should be verified that there are no pending activities in the EDMA3 controller

### 11.3.18 Emulation Considerations

During debug when using the emulator, the CPU(s) may be halted on an execute packet boundary for single-stepping, benchmarking, profiling, or other debug purposes. During an emulation halt, the EDMA3 channel controller and transfer controller operations continue. Events continue to be latched and processed and transfer requests continue to be submitted and serviced.

Since EDMA3 is involved in servicing multiple master and slave peripherals, it is not feasible to have an independent behavior of the EDMA3 for emulation halts. EDMA3 functionality would be coupled with the peripherals it is servicing, which might have different behavior during emulation halts. For example, if a McASP is halted during an emulation access (FREE = 0 and SOFT = 0 or 1 in McASP registers), the McASP stops generating the McASP receive or transmit events (REVT or XEVT) to the EDMA. From the point of view of the McASP, the EDMA3 is suspended, but other peripherals (for example, a timer) still assert events and will be serviced by the EDMA.

Figure 11-21. EDMA3 Prioritization

### 11.3.19 EDMA Transfer Examples

The EDMA3 channel controller performs a variety of transfers depending on the parameter configuration. The following sections provide a description and PaRAM configuration for some typical use case scenarios.

#### 11.3.19.1 Block Move Example

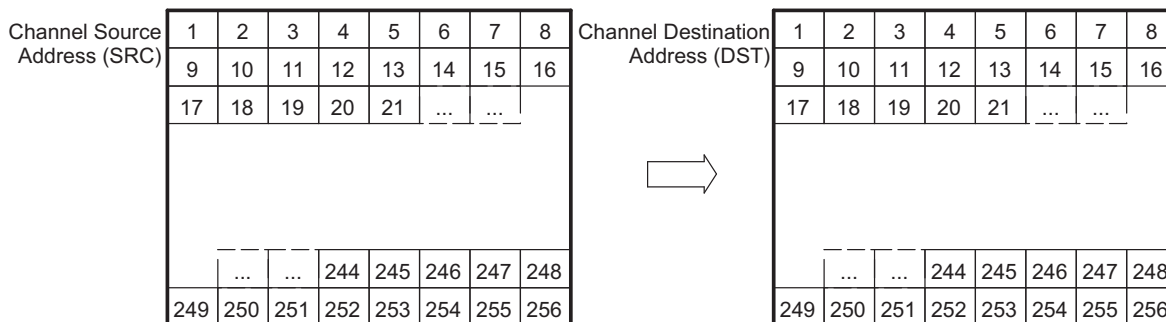

The most basic transfer performed by the EDMA3 is a block move. During device operation it is often necessary to transfer a block of data from one location to another, usually between on-chip and off-chip memory.

In this example, a section of data is to be copied from external memory to internal L2 SRAM as shown in Figure 11-22. Figure 11-23 shows the parameters for this transfer.

The source address for the transfer is set to the start of the data block in external memory, and the destination address is set to the start of the data block in L2. If the data block is less than 64K bytes, the PaRAM configuration shown in Figure 11-23 holds true with the synchronization type set to A-synchronized and indexes cleared to 0. If the amount of data is greater than 64K bytes, BCNT and the B-indexes need to be set appropriately with the synchronization type set to AB-synchronized. The STATIC bit in OPT is set to prevent linking.

This transfer example may also be set up using QDMA. For successive transfer submissions, of a similar nature, the number of cycles used to submit the transfer are fewer depending on the number of changing transfer parameters. You may program the QDMA trigger word to be the highest numbered offset in the PaRAM set that undergoes change.

**Figure 11-22. Block Move Example**

11.3.19.2 Subframe Extraction Example

The EDMA3 can efficiently extract a small frame of data from a larger frame of data. By performing a 2D-to-1D transfer, the EDMA3 retrieves a portion of data for the CPU to process. In this example, a 640 × 480-pixel frame of video data is stored in external memory. Each pixel is represented by a 16-bit halfword. The CPU extracts a 16 × 12-pixel subframe of the image for processing. To facilitate more efficient processing time by the CPU, the EDMA3 places the subframe in internal L2 SRAM. Figure 11-24 shows the transfer of a subframe from external memory to L2. Figure 11-25 shows the parameters for this transfer.

The same PaPARAM entry options are used for QDMA channels, as well as DMA channels. The STATIC bit in OPT is set to prevent linking. For successive transfers, only changed parameters need to be programmed before triggering the channel.

Figure 11-24. Subframe Extraction Example

**11.3.19.3 Data Sorting Example**

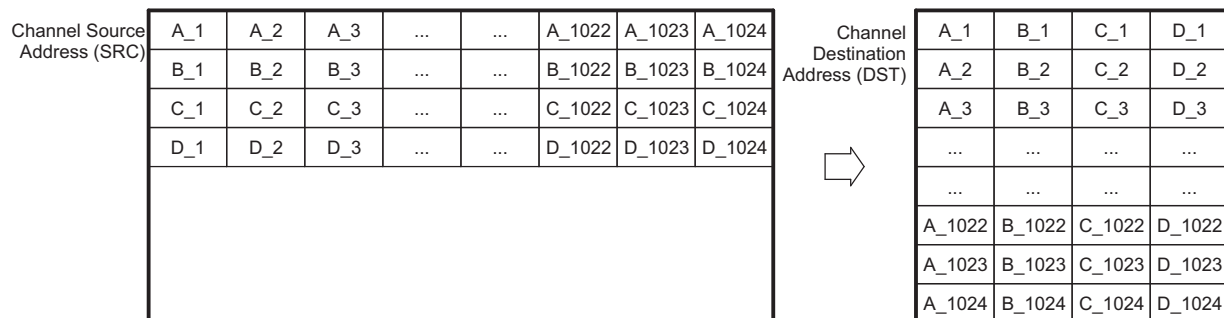

Many applications require the use of multiple data arrays; it is often desirable to have the arrays arranged such that the first elements of each array are adjacent, the second elements are adjacent, and so on. Often this is not how the data is presented to the device. Either data is transferred via a peripheral with the data arrays arriving one after the other or the arrays are located in memory with each array occupying a portion of contiguous memory spaces. For these instances, the EDMA3 can reorganize the data into the desired format. [Figure 11-26](#) shows the data sorting.

To determine the parameter set values, the following need to be considered:

- ACNT - Program this to be the size in bytes of an element.
- BCNT - Program this to be the number of elements in a frame.
- CCNT - Program this to be the number of frames.
- SRCBIDX - Program this to be the size of the element or ACNT.
- DSTBIDX - CCNT × ACNT
- SRCCDX - ACNT × BCNT
- DSTCIDX - ACNT

The synchronization type needs to be AB-synchronized and the STATIC bit is 0 to allow updates to the parameter set. It is advised to use normal EDMA3 channels for sorting.

It is not possible to sort this with a single trigger event. Instead, the channel can be programmed to be chained to itself. After BCNT elements get sorted, intermediate chaining could be used to trigger the channel again causing the transfer of the next BCNT elements and so on. [Figure 11-27](#) shows the parameter set programming for this transfer, assuming channel 0 and an element size of 4 bytes.

**Figure 11-26. Data Sorting Example**

**Figure 11-27. Data Sorting Example PaRAM Configuration**

**11.3.19.4 Peripheral Servicing Example**

The EDMA3 channel controller also services peripherals in the background of CPU operation, without requiring any CPU intervention. Through proper initialization of the EDMA3 channels, they can be configured to continuously service on-chip and off-chip peripherals throughout the device operation. Each event available to the EDMA3 has its own dedicated channel, and all channels operate simultaneously. The only requirements are to use the proper channel for a particular transfer and to enable the channel event in the event enable register (EER). When programming an EDMA3 channel to service a peripheral, it is necessary to know how data is to be presented to the processor. Data is always provided with some kind of synchronization event as either one element per event (non-bursting) or multiple elements per event (bursting).

**11.3.19.4.1 Non-bursting Peripherals**

Non-bursting peripherals include the on-chip multichannel audio serial port (McASP) and many external devices, such as codecs. Regardless of the peripheral, the EDMA3 channel configuration is the same.

The McASP transmit and receive data streams are treated independently by the EDMA3. The transmit and receive data streams can have completely different counts, data sizes, and formats. [Figure 11-28](#) shows servicing incoming McASP data.

To transfer the incoming data stream to its proper location in DDR memory, the EDMA3 channel must be set up for a 1D-to-1D transfer with A-synchronization. Because an event (AREVT) is generated for every word as it arrives, it is necessary to have the EDMA3 issue the transfer request for each element individually. [Figure 11-29](#) shows the parameters for this transfer. The source address of the EDMA3 channel is set to the data port address(DAT) for McASP, and the destination address is set to the start of the data block in DDR. Because the address of serializer buffer is fixed, the source B index is cleared to 0 (no modification) and the destination B index is set to 01b (increment).

Based on the premise that serial data is typically a high priority, the EDMA3 channel should be programmed to be on queue 0.

Figure 11-28. Servicing Incoming McASP Data Example

### 11.3.19.4.2 Bursting Peripherals

Higher bandwidth applications require that multiple data elements be presented to the processor core for every synchronization event. This frame of data can either be from multiple sources that are working simultaneously or from a single high-throughput peripheral that streams data to/from the processor.

In this example, a port is receiving a video frame from a camera and presenting it to the processor one array at a time. The video image is 640 x 480 pixels, with each pixel represented by a 16-bit element. The image is to be stored in external memory. Figure 11-30 shows this example.

To transfer data from an external peripheral to an external buffer one array at a time based on EVT<sub>n</sub>, channel *n* must be configured. Due to the nature of the data (a video frame made up of arrays of pixels) the destination is essentially a 2D entity. Figure 11-31 shows the parameters to service the incoming data with a 1D-to-2D transfer using AB-synchronization. The source address is set to the location of the video framer peripheral, and the destination address is set to the start of the data buffer. Because the input address is static, the SRCBIDX is 0 (no modification to the source address). The destination is made up of arrays of contiguous, linear elements; therefore, the DSTBIDX is set to pixel size, 2 bytes. ANCT is equal to the pixel size, 2 bytes. BCNT is set to the number of pixels in an array, 640. CCNT is equal to the total number of arrays in the block, 480. SRCCIDX is 0 because the source address undergoes no increment. The DSTCIDX is equal to the difference between the starting addresses of each array. Because a pixel is 16 bits (2 bytes), DSTCIDX is equal to 640 x 2.

### 11.3.19.4.3 Continuous Operation

Configuring an EDMA3 channel to receive a single frame of data is useful, and is applicable to some systems. A majority of the time, however, data is going to be continuously transmitted and received throughout the entire operation of the processor. In this case, it is necessary to implement some form of linking such that the EDMA3 channels continuously reload the necessary parameter sets. In this example, McASP is configured to transmit and receive data on a T1 array. To simplify the example, only two channels are active for both transmit and receive data streams. Each channel receives packets of 128 elements. The packets are transferred from the serial port to internal memory and from internal memory to the serial port, as shown [Figure 11-32](#).

The McASP generates AREVT for every element received and generates AXEVT for every element transmitted. To service the data streams, the DMA channels associated with the McASP must be setup for 1D-to-1D transfers with A-synchronization.

[Figure 11-33](#) shows the parameter entries for the channel for these transfers. To service the McASP continuously, the channels must be linked to a duplicate PaRAM set in the PaRAM. After all frames have been transferred, the EDMA3 channels reload and continue. [Figure 11-34](#) shows the reload parameters for the channel.

#### 11.3.19.4.3.1 Receive Channel

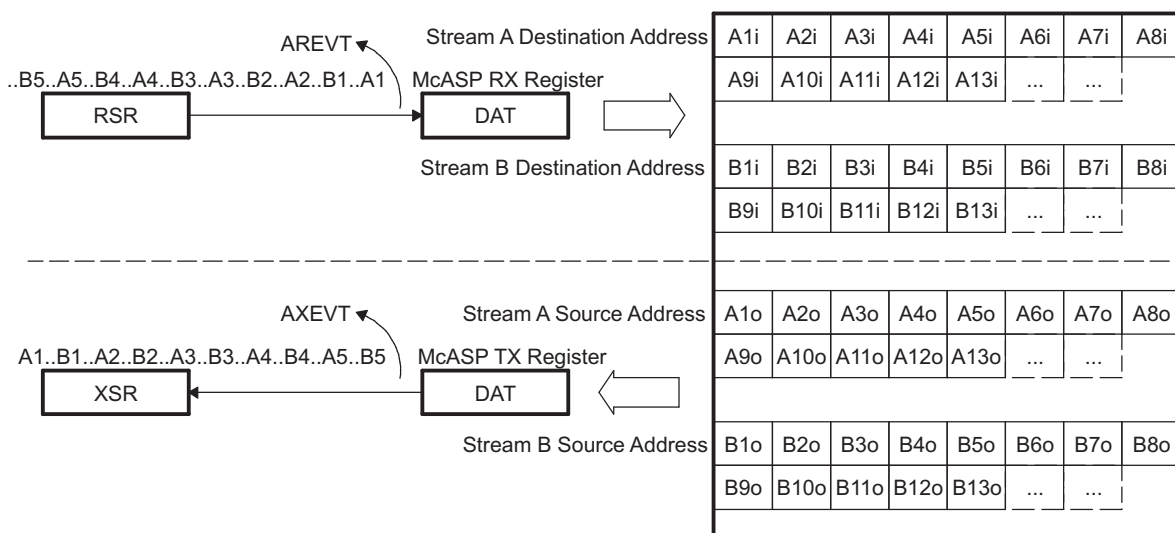

EDMA3 channel 15 services the incoming data stream of McASP. The source address is set to that of the receive serializer buffer, and the destination address is set to the first element of the data block. Because there are two data channels being serviced, A and B, they are to be located separately within the L2 SRAM.

To facilitate continuous operation, a copy of the PaRAM set for the channel is placed in PaRAM set 64. The LINK option is set and the link address is provided in the PaRAM set. Upon exhausting the channel 15 parameter set, the parameters located at the link address are loaded into the channel 15 parameter set and operation continues. This function continues throughout device operation until halted by the CPU.

#### 11.3.19.4.3.2 Transmit Channel

EDMA3 channel 12 services the outgoing data stream of McASP. In this case the destination address needs no update, hence, the parameter set changes accordingly. Linking is also used to allow continuous operation by the EDMA3 channel, with duplicate PaRAM set entries at PaRAM set 65.

#### 11.3.19.4.4 Ping-Pong Buffering

Although the previous configuration allows the EDMA3 to service a peripheral continuously, it presents a number of restrictions to the CPU. Because the input and output buffers are continuously being filled/emptied, the CPU must match the pace of the EDMA3 very closely to process the data. The EDMA3 receive data must always be placed in memory before the CPU accesses it, and the CPU must provide the output data before the EDMA3 transfers it. Though not impossible, this is an unnecessary challenge. It is particularly difficult in a 2-level cache scheme.

Ping-pong buffering is a simple technique that allows the CPU activity to be distanced from the EDMA3 activity. This means that there are multiple (usually two) sets of data buffers for all incoming and outgoing data streams. While the EDMA3 transfers the data into and out of the ping buffers, the CPU manipulates the data in the pong buffers. When both CPU and EDMA3 activity completes, they switch. The EDMA3 then writes over the old input data and transfers the new output data. [Figure 11-35](#) shows the ping-pong scheme for this example.

To change the continuous operation example, such that a ping-pong buffering scheme is used, the EDMA3 channels need only a moderate change. Instead of one parameter set, there are two; one for transferring data to/from the ping buffers and one for transferring data to/from the pong buffers. As soon as one transfer completes, the channel loads the PaRAM set for the other and the data transfers continue. [Figure 11-36](#) shows the EDMA3 channel configuration required.

Each channel has two parameter sets, ping and pong. The EDMA3 channel is initially loaded with the ping parameters ([Figure 11-36](#)). The link address for the ping set is set to the PaRAM offset of the pong parameter set ([Figure 11-37](#)). The link address for the pong set is set to the PaRAM offset of the ping parameter set ([Figure 11-38](#)). The channel options, count values, and index values are all identical between the ping and pong parameters for each channel. The only differences are the link address provided and the address of the data buffer.

##### 11.3.19.4.4.1 Synchronization with the CPU

To utilize the ping-pong buffering technique, the system must signal the CPU when to begin to access the new data set. After the CPU finishes processing an input buffer (ping), it waits for the EDMA3 to complete before switching to the alternate (pong) buffer. In this example, both channels provide their channel numbers as their report word and set the TCINTEN bit to generate an interrupt after completion. When channel 15 fills an input buffer, the E15 bit in the interrupt pending register (IPR) is set; when channel 12 empties an output buffer, the E12 bit in IPR is set. The CPU must manually clear these bits. With the channel parameters set, the CPU polls IPR to determine when to switch. The EDMA3 and CPU could alternatively be configured such that the channel completion interrupts the CPU. By doing this, the CPU could service a background task while waiting for the EDMA3 to complete.

**11.3.19.4.5 Transfer Chaining Examples**

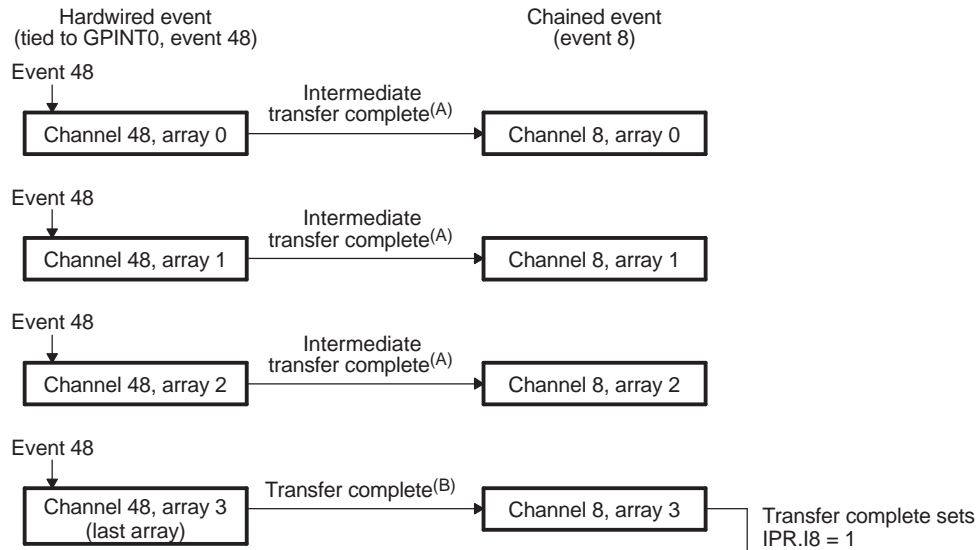

The following examples explain the intermediate transfer complete chaining function.

**11.3.19.4.5.1 Servicing Input/Output FIFOs with a Single Event**

Many systems require the use of a pair of external FIFOs that must be serviced at the same rate. One FIFO buffers data input, and the other buffers data output. The EDMA3 channels that service these FIFOs can be set up for AB-synchronized transfers. While each FIFO is serviced with a different set of parameters, both can be signaled from a single event. For example, an external interrupt pin can be tied to the status flags of one of the FIFOs. When this event arrives, the EDMA3 needs to perform servicing for both the input and output streams. Without the intermediate transfer complete chaining feature this would require two events, and thus two external interrupt pins. The intermediate transfer complete chaining feature allows the use of a single external event (for example, a GPIO event). [Figure 11-39](#) shows the EDMA3 setup and illustration for this example.

A GPIO event (in this case, GPINT0) triggers an array transfer. Upon completion of each intermediate array transfer of channel 48, intermediate transfer complete chaining sets the E8 bit (specified by TCC of 8) in the chained event register (CER) and provides a synchronization event to channel 8. Upon completion of the last array transfer of channel 48, transfer complete chaining—not intermediate transfer complete chaining—sets the E8 bit in CER (specified by TCCMODE:TCC) and provides a synchronization event to channel 8. The completion of channel 8 sets the I8 bit (specified by TCCMODE:TCC) in the interrupt pending register (IPR), which can generate an interrupt to the CPU, if the I8 bit in the interrupt enable register (IER) is set.

**Figure 11-39. Intermediate Transfer Completion Chaining Example**

Notes: (A) Intermediate transfer complete chaining synchronizes event 8  
ITCCHEN = 1, TCC = 01000b, and sets CER.E8 = 1  
(B) Transfer complete chaining synchronizes event 8  
TCCHEN = 1, TCC = 01000b and sets CER.E8 = 1

Setup

Channel 48 parameters for chaining

- Enable transfer complete chaining:  
OPT.TCCHEN = 1  
OPT.TCC = 01000b
- Enable intermediate transfer complete chaining:  
OPT.ITCCHEN = 1  
OPT.TCC = 01000b

Channel 8 parameters for chaining

- Enable transfer complete chaining:  
OPT.TCINTEN = 1  
OPT.TCC = 01000b
- Disable intermediate transfer complete chaining:  
OPT.ITCCHEN = 0

Event enable register (EER)

- Enable channel 48  
EER.E48 = 1

**11.3.19.4.5.2 Breaking Up Large Transfers with Intermediate Chaining**

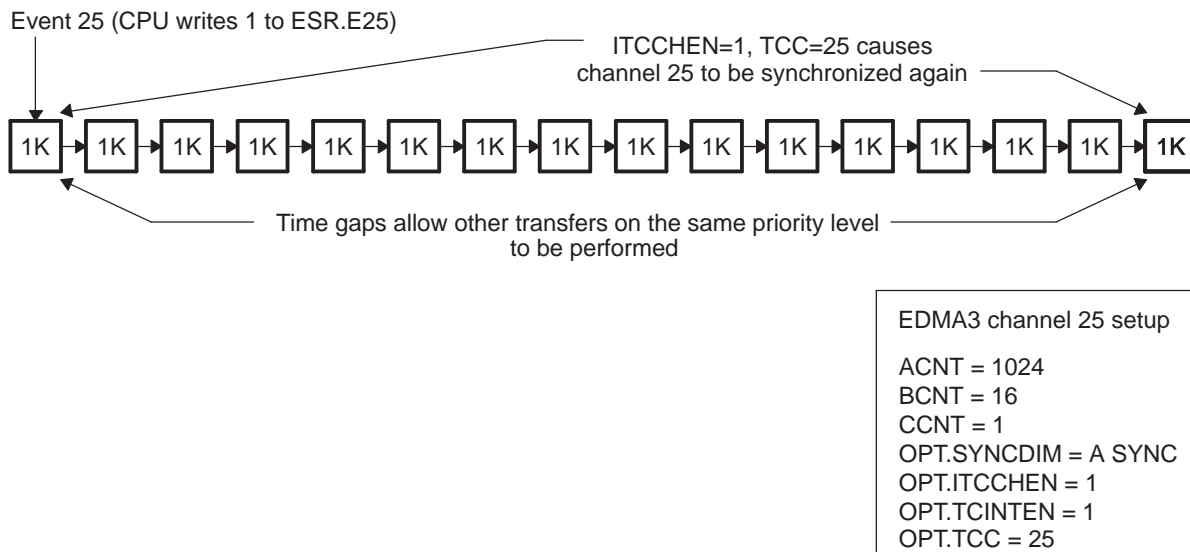

Another feature of intermediate transfer chaining (ITCCHEN) is for breaking up large transfers. A large transfer may lock out other transfers of the same priority level for the duration of the transfer. For example, a large transfer on queue 0 from the internal memory to the external memory using the EMIF may starve other EDMA3 transfers on the same queue. In addition, this large high-priority transfer may prevent the EMIF for a long duration to service other lower priority transfers. When a large transfer is considered to be high priority, it should be split into multiple smaller transfers. Figure 11-40 shows the EDMA3 setup and illustration of an example single large block transfer.

**Figure 11-40. Single Large Block Transfer Example**

The intermediate transfer chaining enable (ITCCHEN) provides a method to break up a large transfer into smaller transfers. For example, to move a single large block of memory (16K bytes), the EDMA3 performs an A-synchronized transfer. The element count is set to a reasonable value, where reasonable derives from the amount of time it would take to move this smaller amount of data. Assume 1 Kbyte is a reasonable small transfer in this example. The EDMA3 is set up to transfer 16 arrays of 1 Kbyte elements, for a total of 16K byte elements. The TCC field in the channel options parameter (OPT) is set to the same value as the channel number and ITCCHEN are set. In this example, EDMA3 channel 25 is used and TCC is also set to 25. The TCINTEN may also be set to trigger interrupt 25 when the last 1 Kbyte array is transferred. The CPU starts the EDMA3 transfer by writing to the appropriate bit of the event set register (ESR.E25). The EDMA3 transfers the first 1 Kbyte array. Upon completion of the first array, intermediate transfer complete code chaining generates a synchronization event to channel 25, a value specified by the TCC field. This intermediate transfer completion chaining event causes EDMA3 channel 25 to transfer the next 1 Kbyte array. This process continues until the transfer parameters are exhausted, at which point the EDMA3 has completed the 16K byte transfer. This method breaks up a large transfer into smaller packets, thus providing natural time slices in the transfer such that other events may be processed. [Figure 11-41](#) shows the EDMA3 setup and illustration of the broken up smaller packet transfers.

### 11.4.1.1 Global Registers

#### 11.4.1.1.1 Peripheral Identification Register (PID)

The peripheral identification register (PID) uniquely identifies the EDMA3CC and the specific revision of the EDMA3CC.

The PID is shown in [Figure 11-42](#) and described in [Table 11-26](#).

**Figure 11-42. Peripheral ID Register (PID)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 11-26. Peripheral ID Register (PID) Field Descriptions**

Bit	Field	Value	Description
31-0	PID	40014C00h	Peripheral identifier uniquely identifies the EDMA3CC and the specific revision of the EDMA3CC.

### 11.4.1.1.2 EDMA3CC Configuration Register (CCCFG)

The EDMA3CC configuration register (CCCFG) provides the features/resources for the EDMA3CC in a particular device.

The CCCFG is shown in [Figure 11-43](#) and described in [Table 11-27](#).

**Figure 11-43. EDMA3CC Configuration Register (CCCFG)**

31	Reserved				26	25	24

LEGEND: R = Read only; -n = value after reset; -x = value is indeterminate after reset

**Table 11-27. EDMA3CC Configuration Register (CCCFG) Field Descriptions**

Bit	Field	Value	Description
31-26	Reserved	0	Reserved.
25	MP_EXIST	0	Memory protection existence.
		Reserved.	
		1	Memory protection logic included.
24	CHMAP_EXIST	0	Channel mapping existence.
		Reserved.	
		1	Channel mapping logic included.
23-22	Reserved	0	Reserved.
21-20	NUM_REGN	0-3h	Number of MP and shadow regions.
		0-1h	Reserved.
		2h	4 regions.
		3h	Reserved.
19	Reserved	0	Reserved.
18-16	NUM_EVQUE	0-7h	Number of queues/number of TCs.
		0-1h	Reserved.
		2h	3 EDMA3TCs/Event Queues
		3h-7h	Reserved.
15	Reserved	0	Reserved.
14-12	NUM_PAENTRY	0-7h	Number of PaRAM sets.
		0-3h	Reserved.
		4h	256 PaRAM sets.
		5h-7h	Reserved.
11	Reserved	0	Reserved.

**Table 11-27. EDMA3CC Configuration Register (CCCFG) Field Descriptions (continued)**

Bit	Field	Value	Description
10-8	NUM_INTCH	0-7h 0-3h 4h 5h-7h	Number of interrupt channels. Reserved. 64 interrupt channels. Reserved.
7	Reserved	0	Reserved.
6-4	NUM_QDMACH	0-7h 0-3h 4h 5h-7h	Number of QDMA channels. Reserved. 8 QDMA channels. Reserved.
3	Reserved	0	Reserved.
2-0	NUM_DMACH	0-7h 0-4h 5h 6h-7h	Number of DMA channels. Reserved. 64 DMA channels. Reserved.

### 11.4.1.1.3 EDMA3CC System Configuration Register (SYSCONFIG)

The EDMA3CC system configuration register is used for clock management configuration. The register is shown in [Figure 11-44](#) and described in [Table 11-28](#).

**Figure 11-44. EDMA3CC System Configuration Register (SYSCONFIG)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 11-28. EDMA3CC System Configuration Register (SYSCONFIG) Field Descriptions**

Bit	Field	Value	Description
31-6	Reserved	0	Read returns 0.
5-4	Reserved	0	Reserved.
3-2	IDLEMODE	2h	Configuration of the local target state management mode. By definition, target can handle read/write transaction as long as it is out of IDLE state. 0x0 = Force-idle mode: local target's idle state follows (acknowledges) the system's idle requests unconditionally, i.e. regardless of the IP module's internal requirements. Backup mode, for debug only. 0x1 = No-idle mode: local target never enters idle state. Backup mode, for debug only. 0x2 = Smart-idle mode: local target's idle state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module shall not generate (IRQ- or DMA-request-related) wakeup events. 0x3 = Reserved.
1	Reserved	0	Reserved.
0	Reserved	0	Reserved.

#### 11.4.1.1.4 DMA Channel Map $n$ Registers (DCHMAP $n$ )

The DMA channel map  $n$  register (DCHMAP $n$ ) is shown in [Figure 11-45](#) and described in [Table 11-29](#).

**Figure 11-45. DMA Channel Map  $n$  Registers (DCHMAP $n$ )**

LEGEND: R/W = Read/Write; R = Read only; - $n$  = value after reset

**Table 11-29. DMA Channel Map  $n$  Registers (DCHMAP $n$ ) Field Descriptions**

Bit	Field	Value	Description
31-14	Reserved	0	Reserved
13-5	PAENTRY	0-1FFh	Points to the PaRAM set number for DMA channel $n$ .
4-0	Reserved	0	Reserved

### 11.4.1.1.5 QDMA Channel Map $n$ Registers (QCHMAP $n$ )

Each QDMA channel in EDMA3CC can be associated with any PaRAM set available on the device. Furthermore, the specific trigger word (0-7) of the PaRAM set can be programmed. The PaRAM set association and trigger word for every QDMA channel register is configurable using the QDMA channel map  $n$  register (QCHMAP $n$ ).

The QCHMAP $n$  is shown in [Figure 11-46](#) and described in [Table 11-30](#).

**NOTE:** At reset the QDMA channel map registers for all QDMA channels point to PaRAM set 0. If an application makes use of both a DMA channel that points to PaRAM set 0 and any QDMA channels, ensure that QCHMAP $n$  is programmed appropriately to point to a different PaRAM entry.

**Figure 11-46. QDMA Channel Map  $n$  Registers (QCHMAP $n$ )**

LEGEND: R/W = Read/Write; R = Read only; - $n$  = value after reset

**Table 11-30. QDMA Channel Map  $n$  Registers (QCHMAP $n$ ) Field Descriptions**

Bit	Field	Value	Description
31-14	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
13-5	PAENTRY	0-1FFh 0-FFh 100h-1FFh	PAENTRY points to the PaRAM set number for QDMA channel $n$ . Parameter entry 0 through 255. Reserved.
4-2	TRWORD	0-7h	Points to the specific trigger word of the PaRAM set defined by PAENTRY. A write to the trigger word results in a QDMA event being recognized.
1-0	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.

### 11.4.1.1.6 DMA Channel Queue $n$ Number Registers (DMAQNUM $n$ )

The DMA channel queue number register (DMAQNUM $n$ ) allows programmability of each of the 64 DMA channels in the EDMA3CC to submit its associated synchronization event to any event queue in the EDMA3CC. At reset, all channels point to event queue 0.

The DMAQNUM $n$  is shown in [Figure 11-47](#) and described in [Table 11-31](#). [Table 11-32](#) shows the channels and their corresponding bits in DMAQNUM $n$ .

**NOTE:** Because the event queues in EDMA3CC have a fixed association to the transfer controllers, that is, Q0 TRs are submitted to TC0, Q1 TRs are submitted to TC1, etc., by programming DMAQNUM $n$  for a particular DMA channel  $n$  also dictates which transfer controller is utilized for the data movement (or which EDMA3TC receives the TR request).

**Figure 11-47. DMA Channel Queue  $n$  Number Registers (DMAQNUM $n$ )**

31	30	28	27	26	24	23	22	20	19	18	16

28-30	E7	E15	E23	E31	E39	E47	E55	E63

### 11.4.1.1.7 QDMA Channel Queue Number Register (QDMAQNUM)

The QDMA channel queue number register (QDMAQNUM) is used to program all the QDMA channels in the EDMA3CC to submit the associated QDMA event to any of the event queues in the EDMA3CC.

The QDMAQNUM is shown in [Figure 11-48](#) and described in [Table 11-33](#).

**Figure 11-48. QDMA Channel Queue Number Register (QDMAQNUM)**

31	30	28	27	26	24	23	22	20	19	18	16

R-0	R/W-0		R-0	R/W-0		R-0	R/W-0		R-0	R/W-0	

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 11-33. QDMA Channel Queue Number Register (QDMAQNUM) Field Descriptions**

Bit	Field	Value	Description
31-15	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
14-0	$E_n$	0-7h 0 1h 2h 3h 4h-7h	QDMA queue number. Contains the event queue number to be used for the corresponding QDMA channel. Event $n$ is queued on Q0. Event $n$ is queued on Q1. Event $n$ is queued on Q2. Event $n$ is queued on Q3. Reserved.

### 11.4.1.1.8 Queue Priority Register (QUEPRI)

The queue priority register (QUEPRI) allows you to change the priority of the individual queues and the priority of the transfer request (TR) associated with the events queued in the queue. Because the queue to EDMA3TC mapping is fixed, programming QUEPRI essentially governs the priority of the associated transfer controller(s) read/write commands with respect to the other bus masters in the device. You can modify the EDMA3TC priority to obtain the desired system performance.

The QUEPRI is shown in [Figure 11-49](#) and described in [Table 11-34](#).

**Figure 11-49. Queue Priority Register (QUEPRI)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 11-34. Queue Priority Register (QUEPRI) Field Descriptions**

Bit	Field	Value	Description
31-15	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
14-12	PRIQ3	0-7h	Priority level for queue 3. Dictates the priority level used by TC3 relative to other masters in the device. A value of 0 means highest priority and a value of 7 means lowest priority.
11	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
10-8	PRIQ2	0-7h	Priority level for queue 2. Dictates the priority level used by TC2 relative to other masters in the device. A value of 0 means highest priority and a value of 7 means lowest priority.
7	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
6-4	PRIQ1	0-7h	Priority level for queue 1. Dictates the priority level used by TC1 relative to other masters in the device. A value of 0 means highest priority and a value of 7 means lowest priority.
3	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
2-0	PRIQ0	0-7h	Priority level for queue 0. Dictates the priority level used by TC0 relative to other masters in the device. A value of 0 means highest priority and a value of 7 means lowest priority.

### 11.4.1.2 Error Registers

The EDMA3CC contains a set of registers that provide information on missed DMA and/or QDMA events, and instances when event queue thresholds are exceeded. If any of the bits in these registers is set, it results in the EDMA3CC generating an error interrupt.

#### 11.4.1.2.1 Event Missed Registers (EMR/EMRH)

For a particular DMA channel, if a second event is received prior to the first event getting cleared/served, the bit corresponding to that channel is set/asserted in the event missed registers (EMR/EMRH). All trigger types are treated individually, that is, manual triggered (ESR/ESRH), chain triggered (CER/CERH), and event triggered (ER/ERH) are all treated separately. The EMR/EMRH bits for a channel are also set if an event on that channel encounters a NULL entry (or a NULL TR is serviced). If any EMR/EMRH bit is set (and all errors, including bits in other error registers (QEMR, CCERR) were previously cleared), the EDMA3CC generates an error interrupt. For details on EDMA3CC error interrupt generation, see *Error Interrupts*.

The EMR is shown in [Figure 11-50](#) and described in [Table 11-35](#). The EMRH is shown in [Figure 11-51](#) and described in [Table 11-36](#).

Bit	Field	Value	Description
31-0	$E_n$		Channel 32-63 event missed. $E_n$ is cleared by writing a 1 to the corresponding bit in the event missed clear register high (EMCRH).
		0	No missed event.
		1	Missed event occurred.

### 11.4.1.2.2 Event Missed Clear Registers (EMCR/EMCRH)

Once a missed event is posted in the event missed registers (EMR/EMRH), the bit remains set and you need to clear the set bit(s). This is done by way of CPU writes to the event missed clear registers (EMCR/EMCRH). Writing a 1 to any of the bits clears the corresponding missed event (bit) in EMR/EMRH; writing a 0 has no effect.

The EMCR is shown in [Figure 11-52](#) and described in [Table 11-37](#). The EMCRH is shown in [Figure 11-53](#) and described in [Table 11-38](#).

**Figure 11-52. Event Missed Clear Register (EMCR)**

**Table 11-38. Event Missed Clear Register High (EMCRH) Field Descriptions**

Bit	Field	Value	Description
31-0	$E_n$		Event missed 32–63 clear. All error bits must be cleared before additional error interrupts will be asserted by the EDMA3CC.
		0	No effect.
		1	Corresponding missed event bit in the event missed register high (EMRH) is cleared ( $E_n = 0$ ).

**11.4.1.2.3 QDMA Event Missed Register (QEMR)**

For a particular QDMA channel, if two QDMA events are detected without the first event getting cleared/serviced, the bit corresponding to that channel is set/asserted in the QDMA event missed register (QEMR). The QEMR bits for a channel are also set if a QDMA event on the channel encounters a NULL entry (or a NULL TR is serviced). If any QEMR bit is set (and all errors, including bits in other error registers (EMR/EMRH, CCERR) were previously cleared), the EDMA3CC generates an error interrupt. For details on EDMA3CC error interrupt generation, see *Error Interrupts*.

The QEMR is shown in [Figure 11-54](#) and described in [Table 11-39](#).

**Figure 11-54. QDMA Event Missed Register (QEMR)**

LEGEND: R = Read only; -n = value after reset

**Table 11-39. QDMA Event Missed Register (QEMR) Field Descriptions**

Bit	Field	Value	Description
31-8	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
7-0	$E_n$	0 1	Channel 0-7 QDMA event missed. $E_n$ is cleared by writing a 1 to the corresponding bit in the QDMA event missed clear register (QEMCR). No missed event. Missed event occurred.

#### 11.4.1.2.4 QDMA Event Missed Clear Register (QEMCR)

Once a missed event is posted in the QDMA event missed registers (QEMR), the bit remains set and you need to clear the set bit(s). This is done by way of CPU writes to the QDMA event missed clear registers (QEMCR). Writing a 1 to any of the bits clears the corresponding missed event (bit) in QEMR; writing a 0 has no effect.

The QEMCR is shown in [Figure 11-55](#) and described in [Table 11-40](#).

**Figure 11-55. QDMA Event Missed Clear Register (QEMCR)**

LEGEND: W = Write only; -n = value after reset

**Table 11-40. QDMA Event Missed Clear Register (QEMCR) Field Descriptions**

Bit	Field	Value	Description
31-8	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
7-0	$E_n$	0	No effect.
		1	Corresponding missed event bit in the QDMA event missed register (QEMR) is cleared ( $E_n = 0$ ).

#### 11.4.1.2.5 EDMA3CC Error Register (CCERR)

The EDMA3CC error register (CCERR) indicates whether or not at any instant of time the number of events queued up in any of the event queues exceeds or equals the threshold/watermark value that is set in the queue watermark threshold register (QWMTHRA). Additionally, CCERR also indicates if when the number of outstanding TRs that have been programmed to return transfer completion code (TRs which have the TCINTEN or TCCHEN bit in OPT set) to the EDMA3CC has exceeded the maximum allowed value of 63. If any bit in CCERR is set (and all errors, including bits in other error registers (EMR/EMRH, QEMR) were previously cleared), the EDMA3CC generates an error interrupt. For details on EDMA3CC error interrupt generation, see *Error Interrupts*. Once the error bits are set in CCERR, they can only be cleared by writing to the corresponding bits in the EDMA3CC error clear register (CCERRCLR).

The CCERR is shown in [Figure 11-56](#) and described in [Table 11-41](#).

**Figure 11-56. EDMA3CC Error Register (CCERR)**

LEGEND: R = Read only; -n = value after reset

**Table 11-41. EDMA3CC Error Register (CCERR) Field Descriptions**

Bit	Field	Value	Description
31-17	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
16	TCCERR	0	Transfer completion code error. TCCERR is cleared by writing a 1 to the corresponding bit in the EDMA3CC error clear register (CCERRCLR). Total number of allowed TCCs outstanding has not been reached.
		1	Total number of allowed TCCs has been reached.
15-4	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
3	QTHRXC3	0	Queue threshold error for queue 3. QTHRXC3 is cleared by writing a 1 to the corresponding bit in the EDMA3CC error clear register (CCERRCLR). Watermark/threshold has not been exceeded.
		1	Watermark/threshold has been exceeded.
2	QTHRXC2	0	Queue threshold error for queue 2. QTHRXC2 is cleared by writing a 1 to the corresponding bit in the EDMA3CC error clear register (CCERRCLR). Watermark/threshold has not been exceeded.
		1	Watermark/threshold has been exceeded.
1	QTHRXC1	0	Queue threshold error for queue 1. QTHRXC1 is cleared by writing a 1 to the corresponding bit in the EDMA3CC error clear register (CCERRCLR). Watermark/threshold has not been exceeded.
		1	Watermark/threshold has been exceeded.
0	QTHRXC0	0	Queue threshold error for queue 0. QTHRXC0 is cleared by writing a 1 to the corresponding bit in the EDMA3CC error clear register (CCERRCLR). Watermark/threshold has not been exceeded.
		1	Watermark/threshold has been exceeded.

#### 11.4.1.2.6 EDMA3CC Error Clear Register (CCERRCLR)

The EDMA3CC error clear register (CCERRCLR) is used to clear any error bits that are set in the EDMA3CC error register (CCERR). In addition, CCERRCLR also clears the values of some bit fields in the queue status registers (QSTAT $n$ ) associated with a particular event queue. Writing a 1 to any of the bits clears the corresponding bit in CCERR; writing a 0 has no effect.

The CCERRCLR is shown in [Figure 11-57](#) and described in [Table 11-42](#).

**Figure 11-57. EDMA3CC Error Clear Register (CCERRCLR)**

31	Reserved				17	16
					TCCERR	
					W-0	
15	4	3	2	1	0	
Reserved		QTHRXC3	QTHRXC2	QTHRXC1	QTHRXC0	
W-0		W-0	W-0	W-0	W-0	

LEGEND: W = Write only; -n = value after reset

**Table 11-42. EDMA3CC Error Clear Register (CCERRCLR) Field Descriptions**

Bit	Field	Value	Description
31-17	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
16	TCCERR	0	Transfer completion code error clear. No effect.
		1	Clears the TCCERR bit in the EDMA3CC error register (CCERR).

**Table 11-42. EDMA3CC Error Clear Register (CCERRCLR) Field Descriptions (continued)**

Bit	Field	Value	Description
15-4	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
3	QTHRCD3	0 1	Queue threshold error clear for queue 3. No effect. Clears the QTHRCD3 bit in the EDMA3CC error register (CCERR) and the WM and THRXCD bits in the queue status register 3 (QSTAT3).
2	QTHRCD2	0 1	Queue threshold error clear for queue 2. No effect. Clears the QTHRCD2 bit in the EDMA3CC error register (CCERR) and the WM and THRXCD bits in the queue status register 2 (QSTAT2).
1	QTHRCD1	0 1	Queue threshold error clear for queue 1. No effect. Clears the QTHRCD1 bit in the EDMA3CC error register (CCERR) and the WM and THRXCD bits in the queue status register 1 (QSTAT1).
0	QTHRCD0	0 1	Queue threshold error clear for queue 0. No effect. Clears the QTHRCD0 bit in the EDMA3CC error register (CCERR) and the WM and THRXCD bits in the queue status register 0 (QSTAT0).

### 11.4.1.2.7 Error Evaluation Register (EEVAL)

The EDMA3CC error interrupt is asserted whenever an error bit is set in any of the error registers (EMR/EMRH, QEMR, and CCERR). For subsequent error bits that get set, the EDMA3CC error interrupt is reasserted only when transitioning from an “all the error bits cleared” to “at least one error bit is set”. Alternatively, a CPU write of 1 to the EVAL bit in the error evaluation register (EEVAL) results in reasserting the EDMA3CC error interrupt, if there are any outstanding error bits set due to subsequent error conditions. Writes of 0 have no effect.

The EEVAL is shown in [Figure 11-58](#) and described in [Table 11-43](#).

**Figure 11-58. Error Evaluation Register (EEVAL)**

LEGEND: R/W = Read/Write; R = Read only; W = Write only; -n = value after reset

**Table 11-43. Error Evaluation Register (EEVAL) Field Descriptions**

Bit	Field	Value	Description
31-2	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
1	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
0	EVAL	0	Error interrupt evaluate. No effect.
		1	EDMA3CC error interrupt will be pulsed if any errors have not been cleared in any of the error registers (EMR/EMRH, QEMR, or CCERR).

### 11.4.1.3 Region Access Enable Registers

The region access enable register group consists of the DMA access enable registers ( $DRAEm$  and  $DRAEHm$ ) and the QDMA access enable registers ( $QRAEm$ ). Where  $m$  is the number of shadow regions in the EDMA3CC memory map for a device. You can configure these registers to assign ownership of DMA/QDMA channels to a particular shadow region.

#### 11.4.1.3.1 DMA Region Access Enable for Region $m$ ( $DRAEm$ )

The DMA region access enable register for shadow region  $m$  ( $DRAEm/DRAEHm$ ) is programmed to allow or disallow read/write accesses on a bit-by-bit bases for all DMA registers in the shadow region  $m$  view of the DMA channel registers. See the EDMA3CC register memory map (Table 11-25) for a list of all the DMA channel and interrupt registers mapped in the shadow region view. Additionally, the  $DRAEm/DRAEHm$  configuration determines completion of which DMA channels will result in assertion of the shadow region  $m$  DMA completion interrupt (see *EDMA3 Interrupts*).

The  $DRAEm$  is shown in Figure 11-59 and described in Table 11-44. The  $DRAEHm$  is shown in Figure 11-60 and described in Table 11-44.

**Figure 11-59. DMA Region Access Enable Register for Region  $m$  ( $DRAEm$ )**

**Table 11-44. DMA Region Access Enable Registers for Region  $M$  ( $DRAEm/DRAEHm$ )  
Field Descriptions**

Bit	Field	Value	Description
31-0	$En$	0	DMA region access enable for bit $n$ /channel $n$ in region $m$ . Accesses via region $m$ address space to bit $n$ in any DMA channel register are not allowed. Reads return 0 on bit $n$ and writes do not modify the state of bit $n$ . Enabled interrupt bits for bit $n$ do not contribute to the generation of a transfer completion interrupt for shadow region $m$ .
		1	Accesses via region $m$ address space to bit $n$ in any DMA channel register are allowed. Reads return the value from bit $n$ and writes modify the state of bit $n$ . Enabled interrupt bits for bit $n$ contribute to the generation of a transfer completion interrupt for shadow region $m$ .

#### 11.4.1.3.2 QDMA Region Access Enable Registers ( $QRAEm$ )

The QDMA region access enable register for shadow region  $m$  ( $QRAEm$ ) is programmed to allow or disallow read/write accesses on a bit-by-bit bases for all QDMA registers in the shadow region  $m$  view of the QDMA registers. This includes all 4-bit QDMA registers.

The  $QRAEm$  is shown in Figure 11-61 and described in Table 11-45.

**Figure 11-61. QDMA Region Access Enable for Region  $m$  (QRAE $m$ ) 32-bit, 2 Rows**

 LEGEND: R/W = Read/Write; R = Read only; - $n$  = value after reset

**Table 11-45. QDMA Region Access Enable for Region  $M$  (QRAE $m$ ) Field Descriptions**

Bit	Field	Value	Description
31-8	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
7-0	$E_n$	0	QDMA region access enable for bit $n$ /QDMA channel $n$ in region $m$ . Accesses via region $m$ address space to bit $n$ in any QDMA channel register are not allowed. Reads return 0 on bit $n$ and writes do not modify the state of bit $n$ .
		1	Accesses via region $m$ address space to bit $n$ in any QDMA channel register are allowed. Reads return the value from bit $n$ and writes modify the state of bit $n$ .

### 11.4.1.4 Status/Debug Visibility Registers

The following set of registers provide visibility into the event queues and a TR life cycle. These are useful for system debug as they provide in-depth visibility for the events queued up in the event queue and also provide information on what parts of the EDMA3CC logic are active once the event has been received by the EDMA3CC.

#### 11.4.1.4.1 Event Queue Entry Registers (QxEy)

The event queue entry registers (QxEy) exist for all 16 queue entries (the maximum allowed queue entries) for all event queues in the EDMA3CC.

There are Q0E0 to Q0E15, Q1E0 to Q1E15, Q2E0 to Q2E15, and Q3E0 to Q3E15. Each register details the event number (ENUM) and the event type (ETYPE). For example, if the value in Q1E4 is read as 000004Fh, this means the 4th entry in queue 1 is a manually-triggered event on DMA channel 15.

The QxEy is shown in [Figure 11-62](#) and described in [Table 11-46](#).

**Figure 11-62. Event Queue Entry Registers (QxEy)**

LEGEND: R = Read only; -n = value after reset; -x = value is indeterminate after reset

**Table 11-46. Event Queue Entry Registers (QxEy) Field Descriptions**

Bit	Field	Value	Description
31-8	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
7-6	ETYPE	0-3h	Event entry y in queue x. Specifies the specific event type for the given entry in the event queue.
		0	Event triggered via ER.
		1h	Manual triggered via ESR.
		2h	Chain triggered via CER.
		3h	Auto-triggered via QER.
5-0	ENUM	0-3Fh	Event entry y in queue x. Event number:
		0-3h	QDMA channel number (0 to 3).
		0-3Fh	DMA channel/event number (0 to 63).

### 11.4.1.4.2 Queue Status Registers (QSTAT<sub>n</sub>)

The queue status registers (QSTAT<sub>n</sub>) is shown in [Figure 11-63](#) and described in [Table 11-47](#).

**Figure 11-63. Queue Status Register *n* (QSTAT<sub>n</sub>)**

31	25	24	23	21	20	16

R-0		R-0		R-0		R-0

LEGEND: R = Read only; -*n* = value after reset

**Table 11-47. Queue Status Register *n* (QSTAT<sub>n</sub>) Field Descriptions**

Bit	Field	Value	Description
31-25	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
24	THRCD	0	Threshold exceeded. THRCD is cleared by writing a 1 to the corresponding QTHRCD <sub>n</sub> bit in the EDMA3CC error clear register (CCERRCLR).
		1	Threshold specified by the Q <sub>n</sub> bit in the queue watermark threshold A register (QWMTHRA) has not been exceeded.
		1	Threshold specified by the Q <sub>n</sub> bit in the queue watermark threshold A register (QWMTHRA) has been exceeded.
23-21	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
20-16	WM	0-10h	Watermark for maximum queue usage. Watermark tracks the most entries that have been in queue <i>n</i> since reset or since the last time that the watermark (WM) bit was cleared. WM is cleared by writing a 1 to the corresponding QTHRCD <sub>n</sub> bit in the EDMA3CC error clear register (CCERRCLR).
		0-10h	Legal values are 0 (empty) to 10h (full).
		11h-1Fh	Reserved.
15-13	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
12-8	NUMVAL	0-10h	Number of valid entries in queue <i>n</i> . The total number of entries residing in the queue manager FIFO at a given instant. Always enabled.
		0-10h	Legal values are 0 (empty) to 10h (full).
		11h-1Fh	Reserved.
7-4	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
3-0	STRTPTR	0-Fh	Start pointer. The offset to the head entry of queue <i>n</i> , in units of entries. Always enabled. Legal values are 0 (0th entry) to Fh (15th entry).

### 11.4.1.4.3 Queue Watermark Threshold A Register (QWMTHRA)

The queue watermark threshold A register (QWMTHRA) is shown in [Figure 11-64](#) and described in [Table 11-48](#).

**Figure 11-64. Queue Watermark Threshold A Register (QWMTHRA)**

31	29	28	24	23	21	20	16

Reserved		Q1		Reserved		Q0	
R-0		R/W-10h		R-0		R/W-10h	

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 11-48. Queue Watermark Threshold A Register (QWMTHRA) Field Descriptions**

Bit	Field	Value	Description
31-29	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
28-24	Q3	0-1Fh 0-10h 11h 12h-1Fh	Queue threshold for queue 3 value. The QTHRCD3 bit in the EDMA3CC error register (CCERR) and the THRCD bit in the queue status register 3 (QSTAT3) are set when the number of events in queue 3 at an instant in time (visible via the NUMVAL bit in QSTAT3) equals or exceeds the value specified by Q3. The default is 16 (maximum allowed). Disables the threshold errors. Reserved.
23-21	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
20-16	Q2	0-1Fh 0-10h 11h 12h-1Fh	Queue threshold for queue 2 value. The QTHRCD2 bit in the EDMA3CC error register (CCERR) and the THRCD bit in the queue status register 2 (QSTAT2) are set when the number of events in queue 2 at an instant in time (visible via the NUMVAL bit in QSTAT2) equals or exceeds the value specified by Q2. The default is 16 (maximum allowed). Disables the threshold errors. Reserved.
15-13	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
12-8	Q1	0-10h 11h 12h-1Fh	Queue threshold for queue 1 value. The QTHRCD1 bit in the EDMA3CC error register (CCERR) and the THRCD bit in the queue status register 1 (QSTAT1) are set when the number of events in queue 1 at an instant in time (visible via the NUMVAL bit in QSTAT1) equals or exceeds the value specified by Q1. The default is 16 (maximum allowed). Disables the threshold errors. Reserved.
7-5	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
4-0	Q0	0-10h 11h 12h-1Fh	Queue threshold for queue 0 value. The QTHRCD0 bit in the EDMA3CC error register (CCERR) and the THRCD bit in the queue status register 0 (QSTAT0) are set when the number of events in queue 0 at an instant in time (visible via the NUMVAL bit in QSTAT0) equals or exceeds the value specified by Q0. The default is 16 (maximum allowed). Disables the threshold errors. Reserved.

#### 11.4.1.4.4 EDMA3CC Status Register (CCSTAT)

The EDMA3CC status register (CCSTAT) has a number of status bits that reflect which parts of the EDMA3CC logic is active at any given instant of time. The CCSTAT is shown in [Figure 11-65](#) and described in [Table 11-49](#).

**Figure 11-65. EDMA3CC Status Register (CCSTAT)**

31	Reserved	24
R-0		
23	22	21

R-0	R-0	R-0
15	14	13
Reserved	COMPACTV	
R-0	R-0	
7	6	5
Reserved	ACTV	Reserved
R-0	R-0	R-0
3	2	1
Reserved	TRACTV	QEV TACTV
R-0	R-0	R-0
0	EVTACTV	
R-0	R-0	

LEGEND: R = Read only; -n = value after reset

**Table 11-49. EDMA3CC Status Register (CCSTAT) Field Descriptions**

Bit	Field	Value	Description
31-20	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
19	QUEACTV3	0	Queue 3 active. No events are queued in queue 3.
		1	At least one TR is queued in queue 3.
18	QUEACTV2	0	Queue 2 active. No events are queued in queue 2.
		1	At least one TR is queued in queue 2.
17	QUEACTV1	0	Queue 1 active. No events are queued in queue 1.
		1	At least one TR is queued in queue 1.
16	QUEACTV0	0	Queue 0 active. No events are queued in queue 0.
		1	At least one TR is queued in queue 0.
15-14	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
13-8	COMPACTV	0-3Fh	Completion request active. The COMPACTV field reflects the count for the number of completion requests submitted to the transfer controllers. This count increments every time a TR is submitted and is programmed to report completion (the TCINTEN or TCCCHEN bits in OPT in the parameter entry associated with the TR are set). The counter decrements for every valid TCC received back from the transfer controllers. If at any time the count reaches a value of 63, the EDMA3CC will not service any new TRs until the count is less than 63 (or return a transfer completion code from a transfer controller, which would decrement the count).
		0	No completion requests outstanding.
		1h-3Fh	Total of 1 completion request to 63 completion requests are outstanding.
7-5	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.

**Table 11-49. EDMA3CC Status Register (CCSTAT) Field Descriptions (continued)**

Bit	Field	Value	Description
4	ACTV	0	Channel controller active. Channel controller active is a logical-OR of each of the *ACTV bits. The ACTV bit remains high through the life of a TR. Channel is idle..
		1	Channel is busy.
3	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
2	TRACTV	0	Transfer request active. Transfer request processing/submission logic is inactive.
		1	Transfer request processing/submission logic is active.
1	QEVTACTV	0	QDMA event active. No enabled QDMA events are active within the EDMA3CC.
		1	At least one enabled QDMA event (QER) is active within the EDMA3CC.
0	EVTACTV	0	DMA event active. No enabled DMA events are active within the EDMA3CC.
		1	At least one enabled DMA event (ER and EER, ESR, CER) is active within the EDMA3CC.

### 11.4.1.5 Memory Protection Address Space

#### 11.4.1.5.1 Memory Protection Fault Address Register (MPFAR)

The memory protection fault address register (MPFAR) is shown in [Figure 11-66](#) and described in [Table 11-50](#). A CPU write of 1 to the MPFCLR bit in the memory protection fault command register (MPFCR) causes any error conditions stored in MPFAR to be cleared.

**Figure 11-66. Memory Protection Fault Address Register (MPFAR)**

LEGEND: R = Read only; -n = value after reset

**Table 11-50. Memory Protection Fault Address Register (MPFAR) Field Descriptions**

Bit	Field	Value	Description
31-0	FADDR	0-FFFF FFFFh	Fault address. This 32-bit read-only status register contains the fault address when a memory protection violation is detected. This register can only be cleared via the memory protection fault command register (MPFCR).

### 11.4.1.5.2 Memory Protection Fault Status Register (MPFSR)

The memory protection fault status register (MPFSR) is shown in [Figure 11-67](#) and described in [Table 11-51](#). A CPU write of 1 to the MPFCLR bit in the memory protection fault command register (MPFCR) causes any error conditions stored in MPFSR to be cleared.

**Figure 11-67. Memory Protection Fault Status Register (MPFSR)**

LEGEND: R = Read only; -n = value after reset

**Table 11-51. Memory Protection Fault Status Register (MPFSR) Field Descriptions**

Bit	Field	Value	Description
31-13	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
12-9	FID	0-Fh	Faulted identification. FID contains valid information if any of the MP error bits (UXE, UWE, URE, SXE, SWE, SRE) are nonzero (that is, if an error has been detected.) The FID field contains the privilege ID for the specific request/requestor that resulted in an MP error.
8-6	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
5	SRE	0 1	Supervisor read error. 0 No error detected. 1 Supervisor level task attempted to read from a MP page without SR permissions.
4	SWE	0 1	Supervisor write error. 0 No error detected. 1 Supervisor level task attempted to write to a MP page without SW permissions.
3	SXE	0 1	Supervisor execute error. 0 No error detected. 1 Supervisor level task attempted to execute from a MP page without SX permissions.
2	URE	0 1	User read error. 0 No error detected. 1 User level task attempted to read from a MP page without UR permissions.
1	UWE	0 1	User write error. 0 No error detected. 1 User level task attempted to write to a MP page without UW permissions.
0	UXE	0 1	User execute error. 0 No error detected. 1 User level task attempted to execute from a MP page without UX permissions.

### 11.4.1.5.3 Memory Protection Fault Command Register (MPFCR)

The memory protection fault command register (MPFCR) is shown in [Figure 11-68](#) and described in [Table 11-52](#).

**Figure 11-68. Memory Protection Fault Command Register (MPFCR)**

LEGEND: R = Read only; W = Write only; -n = value after reset

**Table 11-52. Memory Protection Fault Command Register (MPFCR) Field Descriptions**

Bit	Field	Value	Description
31-1	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
0	MPFCLR	0	Fault clear register. CPU write of 0 has no effect.
		1	CPU write of 1 to the MPFCLR bit causes any error conditions stored in the memory protection fault address register (MPFAR) and the memory protection fault status register (MPFSR) to be cleared.

#### 11.4.1.5.4 Memory Protection Page Attribute Register (MPPAn)

The memory protection page attribute register (MPPAn) is shown in [Figure 11-69](#) and described in [Table 11-53](#).

**Figure 11-69. Memory Protection Page Attribute Register (MPPAn)**

**Table 11-53. Memory Protection Page Attribute Register (MPPAn) Field Descriptions**

Bit	Field	Value	Description
31-16	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
15-10	AID <sub>m</sub>	0	Requests with Privilege ID == N are not allowed to region M, regardless of permission settings (UW, UR, SW, SR).
		1	Requests with Privilege ID == N are permitted, if access type is allowed as defined by permission settings (UW, UR, SW, SR).
9	EXT	0	Requests with Privilege ID >= 6 are not allowed to region M, regardless of permission settings (UW, UR, SW, SR).
		1	Requests with Privilege ID >= 6 are permitted, if access type is allowed as defined by permission settings (UW, UR, SW, SR).
8	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
7-6	Reserved	1	Reserved. Always write 1 to this bit.
5	SR	0	Supervisor read accesses are not allowed from region M.
		1	Supervisor write accesses are allowed from region M addresses.
4	SW	0	Supervisor write accesses are not allowed to region M.
		1	Supervisor write accesses are allowed to region N addresses.
3	SX	0	Supervisor execute accesses are not allowed from region M.
		1	Supervisor execute accesses are allowed from region M addresses.
2	UR	0	User read accesses are not allowed from region M.
		1	User read accesses are allowed from region N addresses.
1	UW	0	User write accesses are not allowed to region M.
		1	User write accesses are allowed to region M addresses.
0	UX	0	User execute accesses are not allowed from region M.
		1	User execute accesses are allowed from region M addresses.

### 11.4.1.6 DMA Channel Registers

The following sets of registers pertain to the 64 DMA channels. The 64 DMA channels consist of a set of registers (with exception of DMAQNUM $n$ ) that each have 64 bits and the bit position of each register matches the DMA channel number. Each register is named with the format *reg\_name* that corresponds to DMA channels 0 through 31 and *reg\_name\_High* that corresponds to DMA channels 32 through 64.

For example, the event register (ER) corresponds to DMA channel 0 through 31 and the event register high register (ERH) corresponds to DMA channel 32 through 63. The register is typically called the event register.

The DMA channel registers are accessible via read/writes to the global address range. They are also accessible via read/writes to the shadow address range. The read/write ability to the registers in the shadow region are controlled by the DMA region access registers (DRAEm/DRAEHm). The registers are described in [Section 11.4.1.3.1](#) and the details for shadow region/global region usage is explained in *EDMA3 Channel Controller Regions*.

#### 11.4.1.6.1 Event Registers (ER, ERH)

All external events are captured in the event register (ER/ERH). The events are latched even when the events are not enabled. If the event bit corresponding to the latched event is enabled (EER.En/EERH.En = 1), then the event is evaluated by the EDMA3CC logic for an associated transfer request submission to the transfer controllers. The event register bits are automatically cleared (ER.En/ERH.En = 0) once the corresponding events are prioritized and serviced. If ER.En/ERH.En are already set and another event is received on the same channel/event, then the corresponding event is latched in the event miss register (EMR.En/EMRH.En), provided that the event was enabled (EER.En/EERH.En = 1).

Event  $n$  can be cleared by the CPU writing a 1 to corresponding event bit in the event clear register (ECR/ECRH). The setting of an event is a higher priority relative to clear operations (via hardware or software). If set and clear conditions occur concurrently, the set condition wins. If the event was previously set, then EMR/EMRH would be set because an event is lost. If the event was previously clear, then the event remains set and is prioritized for submission to the event queues.

The *Debug List* table provides the type of synchronization events and the EDMA3CC channels associated to each of these external events.

The ER is shown in [Figure 11-70](#) and described in [Table 11-54](#). The ERH is shown in [Figure 11-71](#) and described in [Table 11-55](#).

**Figure 11-70. Event Register (ER)**

Bit	Field	Value	Description
31-0	$E_n$	0	Event 32-63. Events 32-63 are captured by the EDMA3CC and are latched into ERH. The events are set ( $E_n = 1$ ) even when events are disabled ( $E_n = 0$ in the event enable register high, EERH). EDMA3CC event is not asserted.
		1	EDMA3CC event is asserted. Corresponding DMA event is prioritized versus other pending DMA/QDMA events for submission to the EDMA3TC.

### 11.4.1.6.2 Event Clear Registers (ECR, ECRH)

Once an event has been posted in the event registers (ER/ERH), the event is cleared in two ways. If the event is enabled in the event enable register (EER/EERH) and the EDMA3CC submits a transfer request for the event to the EDMA3TC, it clears the corresponding event bit in the event register. If the event is disabled in the event enable register (EER/EERH), the CPU can clear the event by way of the event clear registers (ECR/ECRH).

Writing a 1 to any of the bits clears the corresponding event; writing a 0 has no effect. Once an event bit is set in the event register, it remains set until EDMA3CC submits a transfer request for that event or the CPU clears the event by setting the corresponding bit in ECR/ECRH.

The ECR is shown in [Figure 11-72](#) and described in [Table 11-56](#). The ECRH is shown in [Figure 11-73](#) and described in [Table 11-57](#).

**Figure 11-72. Event Clear Register (ECR)**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**Table 11-57. Event Clear Register High (ECRH) Field Descriptions**

Bit	Field	Value	Description
31-0	<i>En</i>		Event clear for event 32-63. Any of the event bits in ECRH are set to clear the event ( <i>En</i> ) in the event register high (ERH). A write of 0 has no effect.
		0	No effect.
		1	EDMA3CC event is cleared in the event register high (ERH).

### 11.4.1.6.3 Event Set Registers (ESR, ESRH)

The event set registers (ESR/ESRH) allow the CPU (EDMA3 programmers) to manually set events to initiate DMA transfer requests. CPU writes of 1 to any event set register ( $E_n$ ) bits set the corresponding bits in the registers. The set event is evaluated by the EDMA3CC logic for an associated transfer request submission to the transfer controllers. Writing a 0 has no effect.

The event set registers operate independent of the event registers (ER/ERH), and a write of 1 is always considered a valid event regardless of whether the event is enabled (the corresponding event bits are set or cleared in EER. $E_n$ /EERH. $E_n$ ).

Once the event is set in the event set registers, it cannot be cleared by CPU writes, in other words, the event clear registers (ECR/ECRH) have no effect on the state of ESR/ESRH. The bits will only be cleared once the transfer request corresponding to the event has been submitted to the transfer controller. The setting of an event is a higher priority relative to clear operations (via hardware). If set and clear conditions occur concurrently, the set condition wins. If the event was previously set, then EMR/EMRH would be set because an event is lost. If the event was previously clear, then the event remains set and is prioritized for submission to the event queues.

Manually-triggered transfers via writes to ESR/ESRH allow the CPU to submit DMA requests in the system, these are relevant for memory-to-memory transfer scenarios. If the ESR. $E_n$ /ESRH. $E_n$  bit is already set and another CPU write of 1 is attempted to the same bit, then the corresponding event is latched in the event missed registers (EMR. $E_n$ /EMRH. $E_n$  = 1).

The ESR is shown in [Figure 11-74](#) and described in [Table 11-58](#). The ESRH is shown in [Figure 11-75](#) and described in [Table 11-59](#).

**Figure 11-74. Event Set Register (ESR)**

#### 11.4.1.6.4 Chained Event Registers (CER, CERH)

When the OPTIONS parameter for a PaRAM entry is programmed to returned a chained completion code (ITCCHEN = 1 and/or TCCHEN = 1), then the value dictated by the TCC[5:0] (also programmed in OPT) forces the corresponding event bit to be set in the chained event registers (CER/CERH). The set chained event is evaluated by the EDMA3CC logic for an associated transfer request submission to the transfer controllers. This results in a chained-triggered transfer.

The chained event registers do not have any enables. The generation of a chained event is essentially enabled by the PaRAM entry that has been configured for intermediate and/or final chaining on transfer completion. The *En* bit is set (regardless of the state of EER.En/EERH.En) when a chained completion code is returned from one of the transfer controllers or is generated by the EDMA3CC via the early completion path. The bits in the chained event register are cleared when the corresponding events are prioritized and serviced.

If the *En* bit is already set and another chaining completion code is return for the same event, then the corresponding event is latched in the event missed registers (EMR.En/EMRH.En = 1). The setting of an event is a higher priority relative to clear operations (via hardware). If set and clear conditions occur concurrently, the set condition wins. If the event was previously set, then EMR/EMRH would be set because an event is lost. If the event was previously clear, then the event remains set and is prioritized for submission to the event queues.

The CER is shown in Figure 11-76 and described in Table 11-60. The CERH is shown in Figure 11-77 and described in Table 11-61.

### 11.4.1.6.5 Event Enable Registers (EER, EERH)

The EDMA3CC provides the option of selectively enabling/disabling each event in the event registers (ER/ERH) by using the event enable registers (EER/EERH). If an event bit in EER/EERH is set (using the event enable set registers, EESR/EESRH), it will enable that corresponding event. Alternatively, if an event bit in EER/EERH is cleared (using the event enable clear registers, EECR/EECRH), it will disable the corresponding event.

The event registers latch all events that are captured by EDMA3CC, even if the events are disabled (although EDMA3CC does not process it). Enabling an event with a pending event already set in the event registers enables the EDMA3CC to process the already set event like any other new event. The EER/EERH settings do not have any effect on chained events (CER.En/CERH.En = 1) and manually set events (ESR.En/ESRH.En = 1).

The EER is shown in Figure 11-78 and described in Table 11-62. The EERH is shown in Figure 11-79 and described in Table 11-63.

**Figure 11-78. Event Enable Register (EER)**

		1	Event is enabled. An external event latched in the event register high (ERH) is evaluated by the EDMA3CC.

### 11.4.1.6.6 Event Enable Clear Register (EECR, EECRH)

The event enable registers (EER/EERH) cannot be modified by directly writing to them. The intent is to ease the software burden for the case where multiple tasks are attempting to simultaneously modify these registers. The event enable clear registers (EECR/EECRH) are used to disable events. Writes of 1 to the bits in EECR/EECRH clear the corresponding event bits in EER/EERH; writes of 0 have no effect.

The EECR is shown in [Figure 11-80](#) and described in [Table 11-64](#). The EECRH is shown in [Figure 11-81](#) and described in [Table 11-65](#).

**Figure 11-80. Event Enable Clear Register (EECR)**

		1	Event is disabled. Corresponding bit in the event enable register high (EERH) is cleared ( $E_n = 0$ ).

### 11.4.1.6.7 Event Enable Set Registers (EESR, EESRH)

The event enable registers (EER/EERH) cannot be modified by directly writing to them. The intent is to ease the software burden for the case where multiple tasks are attempting to simultaneously modify these registers. The event enable set registers (EESR/EESRH) are used to enable events. Writes of 1 to the bits in EESR/EESRH set the corresponding event bits in EER/EERH; writes of 0 have no effect.

The EESR is shown in Figure 11-82 and described in Table 11-66. The EESRH is shown in Figure 11-83 and described in Table 11-67.

**Figure 11-82. Event Enable Set Register (EESR)**

		1	Event is enabled. Corresponding bit in the event enable register high (EERH) is set ( $E_n = 1$ ).

### 11.4.1.6.8 Secondary Event Registers (SER, SERH)

The secondary event registers (SER/SERH) provide information on the state of a DMA channel or event (0 through 63). If the EDMA3CC receives a TR synchronization due to a manual-trigger, event-trigger, or chained-trigger source (ESR.En/ESRH.En = 1, ER.En/ERH.En = 1, or CER.En/CERH.En = 1), which results in the setting of a corresponding event bit in SER/SERH (SER.En/SERH.En = 1), it implies that the corresponding DMA event is in the queue.

Once a bit corresponding to an event is set in SER/SERH, the EDMA3CC does not prioritize additional events on the same DMA channel. Depending on the condition that lead to the setting of the SER bits, either the EDMA3CC hardware or the software (using SECR/SECRH) needs to clear the SER/SERH bits for the EDMA3CC to evaluate subsequent events (subsequent transfers) on the same channel. For additional conditions that can cause the secondary event registers to be set, see *EDMA Overview*.

The SER is shown in [Figure 11-84](#) and described in [Table 11-68](#). The SERH is shown in [Figure 11-85](#) and described in [Table 11-69](#).

**Figure 11-84. Secondary Event Register (SER)**

### 11.4.1.7 Interrupt Registers

All DMA/QDMA channels can be set to assert an EDMA3CC completion interrupt to the CPU on transfer completion, by appropriately configuring the PaRAM entry associated with the channels. The following set of registers is used for the transfer completion interrupt reporting/generating by the EDMA3CC. For more details on EDMA3CC completion interrupt generation, see *EDMA3 Interrupts*.

#### 11.4.1.7.1 Interrupt Enable Registers (IER, IERH)

Interrupt enable registers (IER/IERH) are used to enable/disable the transfer completion interrupt generation by the EDMA3CC for all DMA/QDMA channels. The IER/IERH cannot be written to directly. To set any interrupt bit in IER/IERH, a 1 must be written to the corresponding interrupt bit in the interrupt enable set registers (IESR/IESRH). Similarly, to clear any interrupt bit in IER/IERH, a 1 must be written to the corresponding interrupt bit in the interrupt enable clear registers (IECR/IECRH).

The IER is shown in [Figure 11-88](#) and described in [Table 11-72](#). The IERH is shown in [Figure 11-89](#) and described in [Table 11-73](#).

#### 11.4.1.7.2 Interrupt Enable Clear Register (IECR, IECRH)

The interrupt enable clear registers (IECR/IECRH) are used to clear interrupts. Writes of 1 to the bits in IECR/IECRH clear the corresponding interrupt bits in the interrupt enable registers (IER/IERH); writes of 0 have no effect.

The IECR is shown in [Figure 11-90](#) and described in [Table 11-74](#). The IECRH is shown in [Figure 11-91](#) and described in [Table 11-75](#).

**Figure 11-90. Interrupt Enable Clear Register (IECR)**

### 11.4.1.7.3 Interrupt Enable Set Registers (IESR, IESRH)

The interrupt enable set registers (IESR/IESRH) are used to enable interrupts. Writes of 1 to the bits in IESR/IESRH set the corresponding interrupt bits in the interrupt enable registers (IER/IERH); writes of 0 have no effect.

The IESR is shown in [Figure 11-92](#) and described in [Table 11-76](#). The IESRH is shown in [Figure 11-93](#) and described in [Table 11-77](#).

**Figure 11-92. Interrupt Enable Set Register (IESR)**

Bit	Field	Value	Description
31-0	$En$	0	Interrupt enable clear for channels 32-63. No effect.
		1	Corresponding bit in the interrupt enable register high (IERH) is set ( $In = 1$ ).

#### 11.4.1.7.4 Interrupt Pending Register (IPR, IPRH)

If the TCINTEN and/or ITCINTEN bit in the channel option parameter (OPT) is set in the PaRAM entry associated with the channel (DMA or QDMA), then the EDMA3TC (for normal completion) or the EDMA3CC (for early completion) returns a completion code on transfer or intermediate transfer completion. The value of the returned completion code is equal to the TCC bit in OPT for the PaRAM entry associated with the channel.

When an interrupt transfer completion code with  $TCC = n$  is detected by the EDMA3CC, then the corresponding bit is set in the interrupt pending register (IPR. $ln$ , if  $n = 0$  to 31; IPRH. $ln$ , if  $n = 32$  to 63). Note that once a bit is set in the interrupt pending registers, it remains set; it is your responsibility to clear these bits. The bits set in IPR/IPRH are cleared by writing a 1 to the corresponding bits in the interrupt clear registers (ICR/ICRH).

The IPR is shown in Figure 11-94 and described in Table 11-78. The IPRH is shown in Figure 11-95 and described in Table 11-79.

**Figure 11-94. Interrupt Pending Register (IPR)**

		1	Interrupt transfer completion code is detected ( $ln = 1$ , $n = EDMA3TC[5:0]$ ).

#### 11.4.1.7.5 Interrupt Clear Registers (ICR, ICRH)

The bits in the interrupt pending registers (IPR/IPRH) are cleared by writing a 1 to the corresponding bits in the interrupt clear registers (ICR/ICRH). Writes of 0 have no effect. All set bits in IPR/IPRH must be cleared to allow EDMA3CC to assert additional transfer completion interrupts.

The ICR is shown in [Figure 11-96](#) and described in [Table 11-80](#). The ICRH is shown in [Figure 11-97](#) and described in [Table 11-81](#).

**Figure 11-96. Interrupt Clear Register (ICR)**

LEGEND: W = Write only; -n = value after reset

**Table 11-81. Interrupt Clear Register High (ICRH) Field Descriptions**

Bit	Field	Value	Description
31-0	In	0	Interrupt clear register for TCC = 32-63. No effect.
		1	Corresponding bit in the interrupt pending register high (IPRH) is cleared (In = 0).

### 11.4.1.7.6 Interrupt Evaluate Register (IEVAL)

The interrupt evaluate register (IEVAL) is the only register that physically exists in both the global region and the shadow regions. In other words, the read/write accessibility for the shadow region IEVAL is not affected by the DMA/QDMA region access registers (DRAEm/DRAEHm, QRAEn/QRAEHn). IEVAL is needed for robust ISR operations to ensure that interrupts are not missed by the CPU.

The IEVAL is shown in [Figure 11-98](#) and described in [Table 11-82](#).

**Figure 11-98. Interrupt Evaluate Register (IEVAL)**

LEGEND: R = Read only; W = Write only; -n = value after reset

**Table 11-82. Interrupt Evaluate Register (IEVAL) Field Descriptions**

Bit	Field	Value	Description
31-2	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
1	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
0	EVAL	0 1	Interrupt evaluate. 0 No effect. 1 Causes EDMA3CC completion interrupt to be pulsed, if any enabled (IERn/IERHn = 1) interrupts are still pending (IPRn/IPRHn = 1).  The EDMA3CC completion interrupt that is pulsed depends on which IEVAL is being exercised. For example, writing to the EVAL bit in IEVAL pulses the global completion interrupt, but writing to the EVAL bit in IEVAL0 pulses the region 0 completion interrupt.

### 11.4.1.8 QDMA Registers

The following sets of registers control the QDMA channels in the EDMA3CC. The QDMA channels (with the exception of the QDMA queue number register) consist of a set of registers, each of which have a bit location. Each bit position corresponds to a QDMA channel number. The QDMA channel registers are accessible via read/writes to the global address range. They are also accessible via read/writes to the shadow address range. The read/write accessibility in the shadow region address range is controlled by the QDMA region access registers (QRAEn/QRAEHn). *EDMA3 Channel Controller Regions* details shadow region/global region usage.

#### 11.4.1.8.1 QDMA Event Register (QER)

The QDMA event register (QER) channel *n* bit is set ( $E_n = 1$ ) when the CPU or any EDMA3 programmer (including EDMA3) performs a write to the trigger word (using the QDMA channel mapping register (QCHMAPn)) in the PaRAM entry associated with QDMA channel *n* (which is also programmed using QCHMAPn). The  $E_n$  bit is also set when the EDMA3CC performs a link update on a PaRAM address that matches the QCHMAPn settings. The QDMA event is latched only if the QDMA event enable register (QEER) channel *n* bit is also enabled ( $QEER.E_n = 1$ ). Once a bit is set in QER, then the corresponding QDMA event (auto-trigger) is evaluated by the EDMA3CC logic for an associated transfer request submission to the transfer controllers. For additional conditions that can lead to the setting of QER bits, see *EDMA Overview*.

The setting of an event is a higher priority relative to clear operations (via hardware). If set and clear conditions occur concurrently, the set condition wins. If the event was previously set, then the QDMA event missed register (QEMR) would be set because an event is lost. If the event was previously clear, then the event remains set and is prioritized for submission to the event queues.

The set bits in QER are only cleared when the transfer request associated with the corresponding channels has been processed by the EDMA3CC and submitted to the transfer controller. If the  $E_n$  bit is already set and a QDMA event for the same QDMA channel occurs prior to the original being cleared, then the second missed event is latched in QEMR ( $E_n = 1$ ).

The QER is shown in [Figure 11-99](#) and described in [Table 11-83](#).

**Figure 11-99. QDMA Event Register (QER)**

LEGEND: R = Read only; -n = value after reset

**Table 11-83. QDMA Event Register (QER) Field Descriptions**

Bit	Field	Value	Description
31-8	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
7-0	$E_n$	0	No effect.
		1	Corresponding QDMA event is prioritized versus other pending DMA/QDMA events for submission to the EDMA3TC.

### 11.4.1.8.2 QDMA Event Enable Register (QEER)

The EDMA3CC provides the option of selectively enabling/disabling each channel in the QDMA event register (QER) by using the QDMA event enable register (QEER). If any of the event bits in QEER is set (using the QDMA event enable set register, QEESR), it will enable that corresponding event. Alternatively, if any event bit in QEER is cleared (using the QDMA event enable clear register, QEECR), it will disable the corresponding QDMA channel. The QDMA event register will not latch any event for a QDMA channel, if it is not enabled via QEER.

The QEER is shown in [Figure 11-100](#) and described in [Table 11-84](#).

**Figure 11-100. QDMA Event Enable Register (QEER)**

LEGEND: R = Read only; -n = value after reset

**Table 11-84. QDMA Event Enable Register (QEER) Field Descriptions**

Bit	Field	Value	Description
31-8	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
7-0	$E_n$	0	QDMA event enable for channels 0-7. QDMA channel $n$ is not enabled. QDMA event will not be recognized and will not latch in the QDMA event register (QER).
		1	QDMA channel $n$ is enabled. QDMA events will be recognized and will get latched in the QDMA event register (QER).

### 11.4.1.8.3 QDMA Event Enable Clear Register (QEECR)

The QDMA event enable register (QEER) cannot be modified by directly writing to the register, to ease the software burden when multiple tasks are attempting to simultaneously modify these registers. The QDMA event enable clear register (QEECR) is used to disable events. Writes of 1 to the bits in QEECR clear the corresponding QDMA channel bits in QEER; writes of 0 have no effect.

The QEECR is shown in [Figure 11-101](#) and described in [Table 11-85](#).

**Figure 11-101. QDMA Event Enable Clear Register (QEECR)**

LEGEND: R = Read only; W = Write only; -n = value after reset

**Table 11-85. QDMA Event Enable Clear Register (QEECR) Field Descriptions**

Bit	Field	Value	Description
31-8	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
7-0	$E_n$	0	No effect.
		1	QDMA event is disabled. Corresponding bit in the QDMA event enable register (QEER) is cleared ( $E_n = 0$ ).

#### 11.4.1.8.4 QDMA Event Enable Set Register (QEESR)

The QDMA event enable register (QEER) cannot be modified by directly writing to the register, to ease the software burden when multiple tasks are attempting to simultaneously modify these registers. The QDMA event enable set register (QEESR) is used to enable events. Writes of 1 to the bits in QEESR set the corresponding QDMA channel bits in QEER; writes of 0 have no effect.

The QEESR is shown in [Figure 11-102](#) and described in [Table 11-86](#).

**Figure 11-102. QDMA Event Enable Set Register (QEESR)**

LEGEND: R = Read only; W = Write only; -n = value after reset

**Table 11-86. QDMA Event Enable Set Register (QEESR) Field Descriptions**

Bit	Field	Value	Description
31-8	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
7-0	$E_n$	0 1	QDMA event enable set for channels 0-7. No effect. QDMA event is enabled. Corresponding bit in the QDMA event enable register (QEER) is set ( $E_n = 1$ ).

**11.4.1.8.5 QDMA Secondary Event Register (QSER)**

The QDMA secondary event register (QSER) provides information on the state of a QDMA event. If at any time a bit corresponding to a QDMA channel is set in QSER, that implies that the corresponding QDMA event is in the queue. Once a bit corresponding to a QDMA channel is set in QSER, the EDMA3CC does not prioritize additional events on the same QDMA channel. Depending on the condition that lead to the setting of the QSER bits, either the EDMA3CC hardware or the software (using QSECR) needs to clear the QSER bits for the EDMA3CC to evaluate subsequent QDMA events on the channel. Based on whether the associated TR request is valid, or it is a null or dummy TR, the implications on the state of QSER and the required user actions to submit another QDMA transfer might be different. For additional conditions that can cause the secondary event registers (QSER\SER) to be set, see *EDMA Overview*.

The QSER is shown in [Figure 11-103](#) and described in [Table 11-87](#).

**Figure 11-103. QDMA Secondary Event Register (QSER)**

LEGEND: R = Read only; -n = value after reset

**Table 11-87. QDMA Secondary Event Register (QSER) Field Descriptions**

Bit	Field	Value	Description
31-8	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
7-0	En	0	QDMA secondary event register for channels 0-7. QDMA event is not currently stored in the event queue.
		1	QDMA event is currently stored in the event queue. EDMA3CC will not prioritize additional events.

### 11.4.1.8.6 QDMA Secondary Event Clear Register (QSECR)

The QDMA secondary event clear register (QSECR) clears the status of the QDMA secondary event register (QSER) and the QDMA event register (QER). CPU writes of 1 clear the corresponding set bits in QSER and QER. Writes of 0 have no effect. Note that this differs from the secondary event clear register (SECR) operation, which only clears the secondary event register (SER) bits and does not affect the event registers.

The QSECR is shown in [Figure 11-104](#) and described in [Table 11-88](#).

**Figure 11-104. QDMA Secondary Event Clear Register (QSECR)**

LEGEND: R = Read only; W = Write only; -n = value after reset

**Table 11-88. QDMA Secondary Event Clear Register (QSECR) Field Descriptions**

Bit	Field	Value	Description
31-8	Reserved	0	Reserved
7-0	$E_n$	0 1	QDMA secondary event clear register for channels 0-7. No effect. Corresponding bit in the QDMA secondary event register (QSER) and the QDMA event register (QER) is cleared ( $E_n = 0$ ).

## 11.4.2 EDMA3 Transfer Controller Registers

Table 11-89 lists the memory-mapped registers for the EDMA3 transfer controller (EDMA3TC).

**Table 11-89. EDMA3TC Registers**

Offset	Acronym	Register Description	Section
00h	PID	Peripheral Identification Register	<a href="#">Section 11.4.2.1</a>
04h	TCCFG	EDMA3TC Configuration Register	<a href="#">Section 11.4.2.2</a>
10h	SYSCONFIG	EDMA3TC System Configuration Register	<a href="#">Section 11.4.2.3</a>
0100h	TCSTAT	EDMA3TC Channel Status Register	<a href="#">Section 11.4.2.4</a>
0120h	ERRSTAT	Error Register	<a href="#">Section 11.4.2.5.1</a>
0124h	ERREN	Error Enable Register	<a href="#">Section 11.4.2.5.2</a>
0128h	ERRCLR	Error Clear Register	<a href="#">Section 11.4.2.5.3</a>
012Ch	ERRDET	Error Details Register	<a href="#">Section 11.4.2.5.4</a>
0130h	ERRCMD	Error Interrupt Command Register	<a href="#">Section 11.4.2.5.5</a>
0140h	RDRATE	Read Rate Register	<a href="#">Section 11.4.2.6</a>
0240h	SAOPT	Source Active Options Register	<a href="#">Section 11.4.2.7.1</a>
0244h	SASRC	Source Active Source Address Register	<a href="#">Section 11.4.2.7.2</a>
0248h	SACNT	Source Active Count Register	<a href="#">Section 11.4.2.7.3</a>
024Ch	SADST	Source Active Destination Address Register	<a href="#">Section 11.4.2.7.4</a>
0250h	SABIDX	Source Active Source B-Index Register	<a href="#">Section 11.4.2.7.5</a>
0254h	SAMPPRXY	Source Active Memory Protection Proxy Register	<a href="#">Section 11.4.2.7.6</a>

03CCh	DFDST3	Destination FIFO Destination Address Register 3	<a href="#">Section 11.4.2.7.13</a>

**Table 11-89. EDMA3TC Registers (continued)**

Offset	Acronym	Register Description	Section
03D0h	DFBIDX3	Destination FIFO BIDX Register 3	<a href="#">Section 11.4.2.7.14</a>
03D4h	DFMPPRXY3	Destination FIFO Memory Protection Proxy Register 3	<a href="#">Section 11.4.2.7.15</a>

#### 11.4.2.1 Peripheral Identification Register (PID)

The peripheral identification register (PID) is a constant register that uniquely identifies the EDMA3TC and specific revision of the EDMA3TC. The PID is shown in [Figure 11-105](#) and described in [Table 11-90](#).

**Figure 11-105. Peripheral ID Register (PID)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 11-90. Peripheral ID Register (PID) Field Descriptions**

Bit	Field	Value	Description
31-0	PID	40007C00	Peripheral identifier.

### 11.4.2.2 EDMA3TC Configuration Register (TCCFG)

The EDMA3TC configuration register (TCCFG) is shown in [Figure 11-106](#) and described in [Table 11-91](#).

**Figure 11-106. EDMA3TC Configuration Register (TCCFG)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset; -x = value is indeterminate after reset

**Table 11-91. EDMA3TC Configuration Register (TCCFG) Field Descriptions**

Bit	Field	Value	Description
31-10	Reserved	0	Reserved.
9-8	DREGDEPTH	0-3h	Destination register FIFO depth parameterization.
		0	Reserved.
		1h	Reserved.
		2h	4 entry (for TC0, TC1, TC2, and TC3)
		3h	Reserved.
7-6	Reserved	0	Reserved.
5-4	BUSWIDTH	0-3h	Bus width parameterization.
		0-1h	Reserved.
		2h	128-bit
		3h	Reserved.
3	Reserved	0	Reserved.
2-0	FIFOSIZE	0-7h	FIFO size
		0-1h	Reserved.
		2h	Reserved.
		3h	Reserved.
		4h	512 byte FIFO
		5h	Reserved.
		6h-7h	Reserved.

### 11.4.2.3 EDMA3TC System Configuration Register (SYSCONFIG)

The EDMA3TC system configuration register (SYSCONFIG) is shown in [Figure 11-107](#) and described in [Table 11-92](#).

**Figure 11-107. EDMA3TC System Configuration Register (SYSCONFIG)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset; -x = value is indeterminate after reset

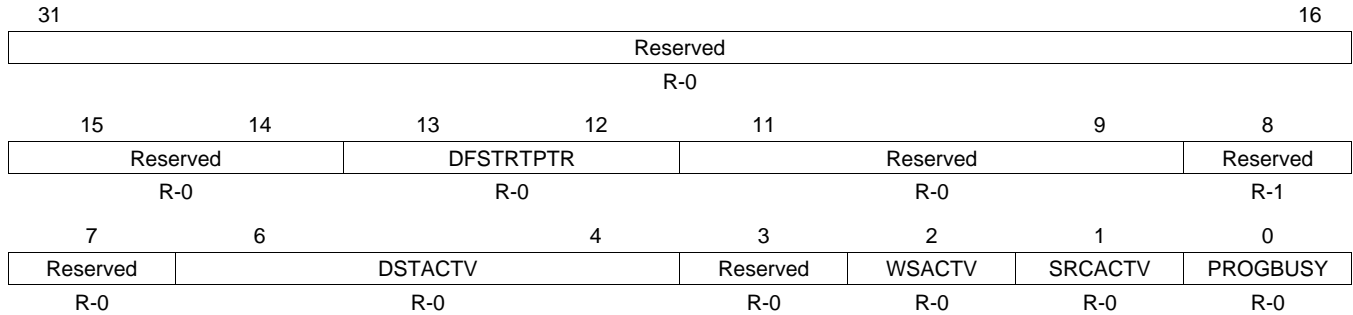

**Table 11-92. EDMA3TC System Configuration (SYSCONFIG) Field Descriptions**

Bit	Field	Value	Description
31-10	Reserved	0	Reserved.
5-4	STANDBYMODE	2h	Configuration of the local initiator state management mode. By definition, initiator may generate read/write transaction as long as it is out of STANDBY state. 0x0 = Force-standby mode: local initiator is unconditionally placed in standby state. Backup mode, for debug only. 0x1 = No-standby mode: local initiator is unconditionally placed out of standby state. Backup mode, for debug only. 0x2 = Smart-standby mode: local initiator standby status depends on local conditions, i.e., the module's functional requirement from the initiator. IP module should not generate (initiator-related) wakeup events. 0x3 = Reserved.
3-2	IDLEMODE	2h	Configuration of the local target state management mode. By definition, target can handle read/write transaction as long as it is out of IDLE state. 0x0 = Force-idle mode: local target's idle state follows (acknowledges) the system's idle requests unconditionally, i.e. regardless of the IP module's internal requirements. Backup mode, for debug only. 0x1 = No-idle mode: local target never enters idle state. Backup mode, for debug only. 0x2 = Smart-idle mode: local target's idle state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module shall not generate (IRQ or DMA-request-related) wakeup events. 0x3 = Reserved.
1-0	Reserved	0	Reserved.

### 11.4.2.4 EDMA3TC Channel Status Register (TCSTAT)

The EDMA3TC channel status register (TCSTAT) is shown in [Figure 11-108](#) and described in [Table 11-93](#).

**Figure 11-108. EDMA3TC Channel Status Register (TCSTAT)**

LEGEND: R = Read only; -n = value after reset

**Table 11-93. EDMA3TC Channel Status Register (TCSTAT) Field Descriptions**

Bit	Field	Value	Description
31-14	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
13-12	DFSTRTPTR	0-3h	Destination FIFO start pointer. Represents the offset to the head entry of the destination register FIFO, in units of entries.
11-9	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
8	Reserved	1	Reserved. Always read as 1.
7	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
6-4	DSTACTV	0-7h	<p>Destination active state. Specifies the number of transfer requests (TRs) that are resident in the destination register FIFO at a given instant. This bit field can be primarily used for advanced debugging. Legal values are constrained by the destination register FIFO depth parameterization (DSTREGDEPTH) parameter.</p> <p>0 Destination FIFO is empty.            1h Destination FIFO contains 1 TR.            2h Destination FIFO contains 2 TRs.            3h Destination FIFO contains 3 TRs.            4h Destination FIFO contains 4 TRs. (Full if DSTREGDEPTH==4).</p> <p>If the destination register FIFO is empty, then any TR written to Prog Set immediately transitions to the destination register FIFO. If the destination register FIFO is not empty and not full, then any TR written to Prog Set immediately transitions to the destination register FIFO set if the source active state (SRCACTV) bit is set to idle.</p> <p>If the destination register FIFO is full, then TRs cannot transition to the destination register FIFO. The destination register FIFO becomes not full when the TR at the head of the destination register FIFO is completed.</p>
5h-7h			Reserved.
3	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
2	WSACTV	0	Write status active
		0	Write status is not pending. Write status has been received for all previously issued write commands.
		1	Write status is pending. Write status has not been received for all previously issued write commands.
1	SRCACTV	0	Source active state
		0	Source controller is idle. Source active register set contains a previously processed transfer request.
		1	Source controller is busy servicing a transfer request.

**Table 11-93. EDMA3TC Channel Status Register (TCSTAT) Field Descriptions (continued)**

Bit	Field	Value	Description
0	PROGBUSY	0	Program set idle and is available for programming by the EDMA3CC.
		1	Program set busy

## 11.4.2.5 Error Registers

### 11.4.2.5.1 Error Register (ERRSTAT)

The error status register (ERRSTAT) is shown in [Figure 11-109](#) and described in [Table 11-94](#).

**Figure 11-109. Error Register (ERRSTAT)**

LEGEND: R = Read only; -n = value after reset

**Table 11-94. Error Register (ERRSTAT) Field Descriptions**

Bit	Field	Value	Description
31-4	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
3	MMRAERR	0	Condition is not detected.
		1	User attempted to read or write to an invalid address in configuration memory map.
2	TRERR	0	Transfer request (TR) error event. Condition is not detected.
		1	TR detected that violates constant addressing mode transfer (SAM or DAM is set) alignment rules or has ACNT or BCNT == 0.
1	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
0	BUSERR	0	Bus error event. Condition is not detected.
		1	EDMA3TC has detected an error at source or destination address. Error information can be read from the error details register (ERRDET).

### 11.4.2.5.2 Error Enable Register (ERREN)

The error enable register (ERREN) is shown in Figure 11-110 and described in Table 11-95.

When any of the enable bits are set, a bit set in the corresponding ERRSTAT causes an assertion of the EDMA3TC interrupt.

**Figure 11-110. Error Enable Register (ERREN)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 11-95. Error Enable Register (ERREN) Field Descriptions**

Bit	Field	Value	Description
31-4	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
3	MMRAERR	0 1	Interrupt enable for MMR address error (MMRAERR). MMRAERR is disabled. MMRAERR is enabled and contributes to the state of EDMA3TC error interrupt generation
2	TRERR	0 1	Interrupt enable for transfer request error (TRERR). TRERR is disabled. TRERR is enabled and contributes to the state of EDMA3TC error interrupt generation.
1	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
0	BUSERR	0 1	Interrupt enable for bus error (BUSERR). BUSERR is disabled. BUSERR is enabled and contributes to the state of EDMA3TC error interrupt generation.

### 11.4.2.5.3 Error Clear Register (ERRCLR)

The error clear register (ERRCLR) is shown in [Figure 11-111](#) and described in [Table 11-96](#).

**Figure 11-111. Error Clear Register (ERRCLR)**

LEGEND: R = Read only; W = Write only; -n = value after reset

**Table 11-96. Error Clear Register (ERRCLR) Field Descriptions**

Bit	Field	Value	Description
31-4	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
3	MMRAERR	0	No effect.
		1	Clears the MMRAERR bit in ERRSTAT but does not clear the error details register (ERRDET).
2	TRERR	0	No effect.
		1	Clears the TRERR bit in ERRSTAT but does not clear the error details register (ERRDET).
1	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
0	BUSERR	0	No effect.
		1	Clears the BUSERR bit in ERRSTAT and clears the error details register (ERRDET).

#### 11.4.2.5.4 Error Details Register (ERRDET)

The error details register (ERRDET) is shown in [Figure 11-112](#) and described in [Table 11-97](#).

**Figure 11-112. Error Details Register (ERRDET)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 11-97. Error Details Register (ERRDET) Field Descriptions**

Bit	Field	Value	Description
31-8	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
17	TCCHEN	0-1	Transfer completion chaining enable. Contains the TCCHEN value in the channel options parameter (OPT) programmed by the channel controller for the read or write transaction that resulted in an error.
16	TCINTEN	0-1	Transfer completion interrupt enable. Contains the TCINTEN value in the channel options parameter (OPT) programmed by the channel controller for the read or write transaction that resulted in an error.
15-14	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
13 - 8	TCC	0-3Fh	Transfer complete code. Contains the TCC value in the channel options parameter (OPT) programmed by the channel controller for the read or write transaction that resulted in an error.
7-4	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
3-0	STAT	0-Fh	Transaction status. Stores the nonzero status/error code that was detected on the read status or write status bus. If read status and write status are returned on the same cycle, then the EDMA3TC chooses nonzero version. If both are nonzero, then the write status is treated as higher priority.
		0	No error.
		1h-7h	Read error.
		8h-Fh	Write error.

### 11.4.2.5.5 Error Interrupt Command Register (ERRCMD)

The error command register (ERRCMD) is shown in [Figure 11-113](#) and described in [Table 11-98](#).

**Figure 11-113. Error Interrupt Command Register (ERRCMD)**

LEGEND: R = Read only; W = Write only; -n = value after reset

**Table 11-98. Error Interrupt Command Register (ERRCMD) Field Descriptions**

Bit	Field	Value	Description
31-2	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
1	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
0	EVAL	0	Error evaluate No effect
		1	EDMA3TC error line is pulsed if any of the error status register (ERRSTAT) bits are set.

### 11.4.2.6 Read Rate Register (RDRATE)

The EDMA3 transfer controller issues read commands at a rate controlled by the read rate register (RDRATE). The RDRATE defines the number of idle cycles that the read controller must wait before issuing subsequent commands. This applies both to commands within a transfer request packet (TRP) and for commands that are issued for different transfer requests (TRs). For instance, if RDRATE is set to 4 cycles between reads, there are 3 inactive cycles between reads.

RDRATE allows flexibility in transfer controller access requests to an endpoint. For an application, RDRATE can be manipulated to slow down the access rate, so that the endpoint may service requests from other masters during the inactive EDMA3TC cycles.

The RDRATE is shown in [Figure 11-114](#) and described in [Table 11-99](#).

---

**NOTE:** It is expected that the RDRATE value for a transfer controller is static, as it is decided based on the application requirement. It is not recommended to change this setting on the fly.

---

**Figure 11-114. Read Rate Register (RDRATE)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 11-99. Read Rate Register (RDRATE) Field Descriptions**

Bit	Field	Value	Description
31-3	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
2-0	RDRATE	0-7h	Read rate. Controls the number of cycles between read commands. This is a global setting that applies to all TRs for this EDMA3TC.
		0	Reads issued as fast as possible.
		1h	4 cycles between reads.
		2h	8 cycles between reads.
		3h	16 cycles between reads.
		4h	32 cycles between reads.
		5h-7h	Reserved.

### 11.4.2.7 EDMA3TC Channel Registers

The EDMA3TC channel registers are split into three parts: the programming registers, the source active registers, and the destination FIFO register. This section describes the registers and their functions. The program register set is programmed by the channel controller, and is for internal use. The other two sets are read-only and provided to facilitate advanced debug capabilities. The number of destination FIFO register sets depends on the destination FIFO depth.

TC0 has a FIFO depth of 2, so there are two sets of destination FIFO registers associated with TC0. TC1, TC2, and TC3 have a destination FIFO depth of 4, so there are four sets of destination FIFO registers for each of these transfer controllers.

#### 11.4.2.7.1 Source Active Options Register (SAOPT)

The source active options register (SAOPT) is shown in [Figure 11-115](#) and described in [Table 11-100](#).

**Figure 11-115. Source Active Options Register (SAOPT)**

31	Reserved						23	22	21	20	19	18	17	16
R-0						TCCHEN	Rsvd	TCINTEN	Reserved			TCC		
R/W-0						R/W-0	R-0	R/W-0	R-0			R/W-0		
15	12	11	10	8	7	6	4		3	2	1	0		
TCC			Rsvd		FWID		Rsvd	PRI		Reserved		DAM	SAM	
R/W-0			R-0		R/W-0		R-0	R/W-0		R-0		R/W-0	R/W-0	

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 11-100. Source Active Options Register (SAOPT) Field Descriptions**

Bit	Field	Value	Description
31-23	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
22	TCCHEN	0 1	Transfer complete chaining enable 0 Transfer complete chaining is disabled. 1 Transfer complete chaining is enabled.
21	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
20	TCINTEN	0 1	Transfer complete interrupt enable. 0 Transfer complete interrupt is disabled. 1 Transfer complete interrupt is enabled.
19-18	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
17-12	TCC	0-3Fh	Transfer complete code. This 6-bit code is used to set the relevant bit in CER or IPR of the EDMA3PCC module.
11	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
10-8	FWID	0-7h 0 1h 2h 3h 4h 5h 6h-7h	FIFO width. Applies if either SAM or DAM is set to constant addressing mode. 0 FIFO width is 8-bit. 1h FIFO width is 16-bit. 2h FIFO width is 32-bit. 3h FIFO width is 64-bit. 4h FIFO width is 128-bit. 5h FIFO width is 256-bit. 6h-7h Reserved.
7	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.

**Table 11-100. Source Active Options Register (SAOPT) Field Descriptions (continued)**

Bit	Field	Value	Description
6-4	PRI	0-7h 0 1h-6h 7h	Transfer priority. Reflects the values programmed in the QUEPRI register in the EDMACC. Priority 0 - Highest priority Priority 1 to priority 6 Priority 7 - Lowest priority
3-2	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
1	DAM	0 1	Destination address mode within an array 0 Increment (INCR) mode. Destination addressing within an array increments. 1 Constant addressing (CONST) mode. Destination addressing within an array wraps around upon reaching FIFO width.
0	SAM	0 1	Source address mode within an array 0 Increment (INCR) mode. Source addressing within an array increments. 1 Constant addressing (CONST) mode. Source addressing within an array wraps around upon reaching FIFO width.

### 11.4.2.7.2 Source Active Source Address Register (SASRC)

The source active source address register (SASRC) is shown in [Figure 11-116](#) and described in [Table 11-101](#).

**Figure 11-116. Source Active Source Address Register (SASRC)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 11-101. Source Active Source Address Register (SASRC) Field Descriptions**

Bit	Field	Value	Description
31-0	SADDR	0-FFFF FFFFh	Source address for program register set. EDMA3TC updates value according to source addressing mode (SAM bit in the source active options register, SAOPT) .

### 11.4.2.7.3 Source Active Count Register (SACNT)

The source active count register (SACNT) is shown in [Figure 11-117](#) and described in [Table 11-102](#).

**Figure 11-117. Source Active Count Register (SACNT)**

LEGEND: R = Read only; -n = value after reset

**Table 11-102. Source Active Count Register (SACNT) Field Descriptions**

Bit	Field	Value	Description
31-16	BCNT	0-FFFFh	B dimension count. Number of arrays to be transferred, where each array is ACNT in length. It is decremented after each read command appropriately. Represents the amount of data remaining to be read. It should be 0 when transfer request (TR) is complete.
15-0	ACNT	0-FFFFh	A dimension count. Number of bytes to be transferred in first dimension. It is decremented after each read command appropriately. Represents the amount of data remaining to be read. It should be 0 when transfer request (TR) is complete.

#### 11.4.2.7.4 Source Active Destination Address Register (SADST)

The source active destination address register (SADST) is shown in [Figure 11-118](#) and described in [Table 11-103](#).

**Figure 11-118. Source Active Destination Address Register (SADST)**

LEGEND: R = Read only; -n = value after reset

**Table 11-103. Source Active Destination Address Register (SADST) Field Descriptions**

Bit	Field	Value	Description
31-0	Reserved	0	Reserved. Always reads as 0.

#### 11.4.2.7.5 Source Active Source B-Dimension Index Register (SABIDX)

The source active set B-dimension index register (SABIDX) is shown in [Figure 11-119](#) and described in [Table 11-104](#).

**Figure 11-119. Source Active Source B-Dimension Index Register (SABIDX)**

LEGEND: R = Read only; -n = value after reset

**Table 11-104. Source Active Source B-Dimension Index Register (SABIDX) Field Descriptions**

Bit	Field	Value	Description
31-16	DBIDX	0	B-Index offset between destination arrays. Represents the offset in bytes between the starting address of each destination. Always reads as 0.
15-0	SBIDX	0-FFFFh	B-Index offset between source arrays. Represents the offset in bytes between the starting address of each source array.

### 11.4.2.7.6 Source Active Memory Protection Proxy Register (SAMPPRXY)

The source active memory protection proxy register (SAMPPRXY) is shown in [Figure 11-120](#) and described in [Table 11-105](#).

**Figure 11-120. Source Active Memory Protection Proxy Register (SAMPPRXY)**

LEGEND: R = Read only; -n = value after reset

**Table 11-105. Source Active Memory Protection Proxy Register (SAMPPRXY) Field Descriptions**

Bit	Field	Value	Description
31-9	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
8	PRIV	0 1	Privilege level. The privilege level used by the host to set up the parameter entry in the channel controller. This field is set up when the associated TR is submitted to the EDMA3TC.  The privilege ID is used while issuing read and write command to the target endpoints so that the target endpoints can perform memory protection checks based on the PRIV of the host that set up the DMA transaction.  0 User-level privilege. 1 Supervisor-level privilege.
7-4	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
3-0	PRIVID	0-Fh	Privilege ID. This contains the privilege ID of the host that set up the parameter entry in the channel controller. This field is set up when the associated TR is submitted to the EDMA3TC.  This PRIVID value is used while issuing read and write commands to the target endpoints so that the target endpoints can perform memory protection checks based on the PRIVID of the host that set up the DMA transaction.

### 11.4.2.7.7 Source Active Count Reload Register (SACNTRLD)

The source active count reload register (SACNTRLD) is shown in [Figure 11-121](#) and described in [Table 11-106](#).

**Figure 11-121. Source Active Count Reload Register (SACNTRLD)**

31	Reserved	16
	R-0	
15	ACNTRLD	0
	R-0	

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 11-106. Source Active Count Reload Register (SACNTRLD) Field Descriptions**

Bit	Field	Value	Description
31-16	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
15-0	ACNTRLD	0-FFFFh	A-count reload value. Represents the originally programmed value of ACNT. The reload value is used to reinitialize ACNT after each array is serviced.

### 11.4.2.7.8 Source Active Source Address B-Reference Register (SASRCBREF)

The source active source address B-reference register (SASRCBREF) is shown in [Figure 11-122](#) and described in [Table 11-107](#).

**Figure 11-122. Source Active Source Address B-Reference Register (SASRCBREF)**

31	SADDRBREF	16
	R-0	
15	SADDRBREF	0
	R-0	

LEGEND: R = Read only; -n = value after reset

**Table 11-107. Source Active Source Address B-Reference Register (SASRCBREF) Field Descriptions**

Bit	Field	Value	Description
31-0	SADDRBREF	0-FFFF FFFFh	Source address B-reference. Represents the starting address for the array currently being read.

### 11.4.2.7.9 Source Active Destination Address B-Reference Register (SADSTBREF)

The source active destination address B-reference register (SADSTBREF) is shown in [Figure 11-123](#) and described in [Table 11-108](#).

**Figure 11-123. Source Active Destination Address B-Reference Register (SADSTBREF)**

LEGEND: R = Read only; -n = value after reset

**Table 11-108. Source Active Destination Address B-Reference Register (SADSTBREF) Field Descriptions**

Bit	Field	Value	Description
31-0	Reserved	0	Reserved. Always reads as 0.

**11.4.2.7.10 Destination FIFO Options Register (DFOPT<sub>n</sub>)**

The destination FIFO options register (DFOPT<sub>n</sub>) is shown in [Figure 11-124](#) and described in [Table 11-109](#).

**NOTE:** The value for *n* varies from 0 to DSTREGDEPTH for the given EDMA3TC.

**Figure 11-124. Destination FIFO Options Register (DFOPT<sub>n</sub>)**

31	Reserved						23	22	21	20	19	18	17	16
							TCCHEN	Rsvd	TCINTEN	Reserved		TCC		
							R-0	R/W-0	R-0	R/W-0	R-0		R/W-0	
15	12	11	10	8	7	6			4	3	2	1	0	
TCC			Rsvd		FWID		Rsvd	PRI		Reserved		DAM	SAM	
R/W-0			R-0		R/W-0		R-0	R/W-0		R-0		R/W-0	R/W-0	

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 11-109. Destination FIFO Options Register (DFOPT<sub>n</sub>) Field Descriptions**

Bit	Field	Value	Description
31-23	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
22	TCCHEN	0 1	Transfer complete chaining enable 0 Transfer complete chaining is disabled 1 Transfer complete chaining is enabled
21	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
20	TCINTEN	0 1	Transfer complete interrupt enable. 0 Transfer complete interrupt is disabled. 1 Transfer complete interrupt is enabled.
19-18	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
17-12	TCC	0-3Fh	Transfer complete code. This 6-bit code is used to set the relevant bit in CER or IPR of the EDMA3PCC module.
11	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
10-8	FWID	0-7h 0 1h 2h 3h 4h 5h 6h-7h	FIFO width. Applies if either SAM or DAM is set to constant addressing mode. 0 FIFO width is 8-bit. 1h FIFO width is 16-bit. 2h FIFO width is 32-bit. 3h FIFO width is 64-bit. 4h FIFO width is 128-bit. 5h FIFO width is 256-bit. 6h-7h Reserved.
7	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
6-4	PRI	0-7h 0 1h-6h 7h	Transfer priority 0 Priority 0 - Highest priority 1h-6h Priority 1 to priority 6 7h Priority 7 - Lowest priority
3-2	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.

**Table 11-109. Destination FIFO Options Register (DFOPT<sub>n</sub>) Field Descriptions (continued)**

Bit	Field	Value	Description
1	DAM	0	Increment (INCR) mode. Destination addressing within an array increments.
		1	Constant addressing (CONST) mode. Destination addressing within an array wraps around upon reaching FIFO width.
0	SAM	0	Increment (INCR) mode. Source addressing within an array increments.
		1	Constant addressing (CONST) mode. Source addressing within an array wraps around upon reaching FIFO width.

### 11.4.2.7.11 Destination FIFO Source Address Register (DFSRC<sub>n</sub>)

The destination FIFO source address register (DFSRC<sub>n</sub>) is shown in [Figure 11-125](#) and described in [Table 11-110](#).

**NOTE:** The value for *n* varies from 0 to DSTREGDEPTH for the given EDMA3TC.

**Figure 11-125. Destination FIFO Source Address Register (DFSRC<sub>n</sub>)**

LEGEND: R = Read only; -*n* = value after reset

**Table 11-110. Destination FIFO Source Address Register (DFSRC<sub>n</sub>) Field Descriptions**

Bit	Field	Value	Description
31-0	Reserved	0	Reserved. Always read as 0.

### 11.4.2.7.12 Destination FIFO Count Register (DFCNT<sub>n</sub>)

The destination FIFO count register (DFCNT<sub>n</sub>) is shown in [Figure 11-126](#) and described in [Table 11-111](#).

**NOTE:** The value for *n* varies from 0 to DSTREGDEPTH for the given EDMA3TC.

**Figure 11-126. Destination FIFO Count Register (DFCNT<sub>n</sub>)**

LEGEND: R = Read only; -*n* = value after reset

**Table 11-111. Destination FIFO Count Register (DFCNT<sub>n</sub>) Field Descriptions**

Bit	Field	Value	Description
31-16	BCNT	0-FFFFh	B-dimension count. Number of arrays to be transferred, where each array is ACNT in length. Count/count remaining for destination register set. Represents the amount of data remaining to be written.
15-0	ACNT	0-FFFFh	A-dimension count. Number of bytes to be transferred in first dimension count/count remaining for destination register set. Represents the amount of data remaining to be written.

### 11.4.2.7.13 Destination FIFO Destination Address Register (DFDST $n$ )

The destination FIFO destination address register (DFDST $n$ ) is shown in [Figure 11-127](#) and described in [Table 11-112](#).

**NOTE:** The value for  $n$  varies from 0 to DSTREGDEPTH for the given EDMA3TC.

**Figure 11-127. Destination FIFO Destination Address Register (DFDST $n$ )**

LEGEND: R = Read only; - $n$  = value after reset

**Table 11-112. Destination FIFO Destination Address Register (DFDST $n$ ) Field Descriptions**

Bit	Field	Value	Description
31-0	DADDR	0	Destination address for the destination FIFO register set. When a transfer request (TR) is complete, the final value should be the address of the last write command issued.

### 11.4.2.7.14 Destination FIFO B-Index Register (DFBIDX $n$ )

The destination FIFO B-index register (DFBIDX $n$ ) is shown in [Figure 11-128](#) and described in [Table 11-113](#).

**NOTE:** The value for  $n$  varies from 0 to DSTREGDEPTH for the given EDMA3TC.

**Figure 11-128. Destination FIFO B-Index Register (DFBIDX $n$ )**

LEGEND: R = Read only; - $n$  = value after reset

**Table 11-113. Destination FIFO B-Index Register (DFBIDX $n$ ) Field Descriptions**

Bit	Field	Value	Description
31-16	DBIDX	0-FFFFh	B-Index offset between destination arrays. Represents the offset in bytes between the starting address of each destination.
15-0	SBIDX	0	Always read as 0.

**11.4.2.7.15 Destination FIFO Memory Protection Proxy Register (DFMPPRXY<sub>n</sub>)**

The destination FIFO memory protection proxy register (DFMPPRXY<sub>n</sub>) is shown in [Figure 11-129](#) and described in [Table 11-105](#).

**Figure 11-129. Destination FIFO Memory Protection Proxy Register (DFMPPRXY<sub>n</sub>)**

LEGEND: R = Read only; -n = value after reset

**Table 11-114. Destination FIFO Memory Protection Proxy Register (DFMPPRXY<sub>n</sub>) Field Descriptions**

Bit	Field	Value	Description
31-9	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
8	PRIV	0 1	Privilege level. This contains the Privilege level used by the EDMA3 programmer to set up the parameter entry in the channel controller. This field is set up when the associated TR is submitted to the EDMA3TC.  The privilege ID is used while issuing read and write command to the target endpoints so that the target endpoints can perform memory protection checks based on the PRIV of the host that set up the DMA transaction.  0 User-level privilege 1 Supervisor-level privilege
7-4	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
3-0	PRIVID	0-Fh	Privilege ID. This contains the Privilege ID of the EDMA3 programmer that set up the parameter entry in the channel controller. This field is set up when the associated TR is submitted to the EDMA3TC.  This PRIVID value is used while issuing read and write commands to the target endpoints so that the target endpoints can perform memory protection checks based on the PRIVID of the host that set up the DMA transaction.

#### 11.4.2.7.16 Destination FIFO Count Reload Register (DFCNTRLD<sub>n</sub>)

The destination FIFO count reload register (DFCNTRLD<sub>n</sub>) is shown in [Figure 11-130](#) and described in [Table 11-115](#).

**Figure 11-130. Destination FIFO Count Reload Register (DFCNTRLD<sub>n</sub>)**

31	Reserved	16
	R-0	
15	ACNTRLD	0
	R-0	

LEGEND: R = Read only; -n = value after reset

**Table 11-115. Destination FIFO Count Reload Register (DFCNTRLD<sub>n</sub>) Field Descriptions**

Bit	Field	Value	Description
31-16	Reserved	0	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.
15-0	ACNTRLD	0-FFFFh	A-count reload value. Represents the originally programmed value of ACNT. The reload value is used to reinitialize ACNT after each array is serviced.

#### 11.4.2.7.17 Destination FIFO Source Address B-Reference Register (DFSRCBREF<sub>n</sub>)

The destination FIFO source address B-reference register (DFSRCBREF<sub>n</sub>) is shown in [Figure 11-131](#) and described in [Table 11-116](#).

**Figure 11-131. Destination FIFO Source Address B-Reference Register (DFSRCBREF<sub>n</sub>)**

31	Reserved	16
	R-0	
15	Reserved	0
	R-0	

LEGEND: R = Read only; -n = value after reset

**Table 11-116. Destination FIFO Source Address B-Reference Register (DFSRCBREF<sub>n</sub>) Field Descriptions**

Bit	Field	Value	Description
31-0	Reserved	0	Reserved. Always read as 0.

### 11.4.2.7.18 Destination FIFO Destination Address B-Reference (DFDSTBREF<sub>n</sub>)

The destination FIFO destination address B-reference register (DFDSTBREF<sub>n</sub>) is shown in [Figure 11-132](#) and described in [Table 11-117](#).

**Figure 11-132. Destination FIFO Destination Address B-Reference Register (DFDSTBREF<sub>n</sub>)**

LEGEND: R = Read only; -n = value after reset

**Table 11-117. Destination FIFO Destination Address B-Reference Register (DFDSTBREF<sub>n</sub>) Field Descriptions**

Bit	Field	Value	Description
31-0	DADDRBREF	0-FFFF FFFFh	Destination address reference for the destination FIFO register set. Represents the starting address for the array currently being written.

## 11.5 Appendix A

### 11.5.1 Debug Checklist

This section lists some tips to keep in mind while debugging applications using the EDMA3.

The following table provides some common issues and their probable causes and resolutions.

**Table 11-118. Debug List**

Issue	Description/Solution
The transfer associated with the channel does not happen. The channel does not get serviced.	The EDMA3CC may not service a transfer request, even though the associated PaRAM set is programmed appropriately. Check for the following: 1) Verify that events are enabled, i.e., if an external/peripheral event is latched in Event Registers (ER/ERH), make sure that the event is enabled in the Event Enable Registers (EER/EERH). Similarly, for QDMA channels, make sure that QDMA events are appropriately enabled in the QDMA Event Enable Register (QEER). 2) Verify that the DMA or QDMA Secondary Event Register (SER/SERH/QSERH) bits corresponding to the particular event or channel are not set.
The Secondary Event Registers bits are set, not allowing additional transfers to occur on a channel.	It is possible that a trigger event was received when the parameter set associated with the channel/event was a NULL set for a previous transfer on the channel. This is typical in two cases: 1) QDMA channels: Typically if the parameter set is non-static and expected to be terminated by a NULL set (i.e., OPT.STATIC = 0, LINK = 0xFFFF), the parameter set is updated with a NULL set after submission of the last TR. Because QDMA channels are auto-triggered, this update caused the generation of an event. An event generated for a NULL set causes an error condition and results in setting the bits corresponding to the QDMA channel in the QEMR and QSER. This will disable further prioritization of the channel. 2) DMA channels used in a continuous mode: The peripheral may be set up to continuously generate infinite events (for instance, in case of McASP, every time the data shifts out from the DXR register, it generates an XEVT). The parameter set may be programmed to expect only a finite number of events and to be terminated by a NULL link. After the expected number of events, the parameter set is reloaded with a NULL parameter set. Because the peripheral will generate additional events, an error condition is set in the SER.Ex and EMR.Ex set, preventing further event prioritization. You must ensure that the number of events received is limited to the expected number of events for which the parameter set is programmed, or you must ensure that bits corresponding to particular channel or event are not set in the Secondary event registers (SER/SERH/QSER) and Event Missed Registers (EMR/EMRH/QEMR) before trying to perform subsequent transfers for the event/channel.

**Table 11-118. Debug List (continued)**

Issue	Description/Solution
Completion interrupts are not asserted, or no further interrupts are received after the first completion interrupt.	<p>You must ensure the following:</p> <ol style="list-style-type: none"> <li>1) The interrupt generation is enabled in the OPT of the associated PaRAM set (TCINTEN = 1 and/or ITCINTEN = 1).</li> <li>2) The interrupts are enabled in the EDMA3 Channel Controller, via the Interrupt Enable Registers (IER/IERH).</li> <li>3) The corresponding interrupts are enabled in the device interrupt controller.</li> <li>4) The set interrupts are cleared in the interrupt pending registers (IPR/IPRH) before exiting the transfer completion interrupt service routine (ISR). See <a href="#">Section 11.3.9.1.2</a> for details on writing EDMA3 ISRs.</li> <li>5) If working with shadow region interrupts, make sure that the DMA Region Access registers (DRAE/DRAEH) are set up properly, because the DRAE/DRAEH registers act as secondary enablers for shadow region completion interrupts, along with the IER/IERH registers.</li> </ol> <p>If working with shadow region interrupts, make sure that the bits corresponding to the transfer completion code (TCC) value are also enabled in the DRAE/DRAEH registers. For instance, if the PaRAM set associated with Channel 0 returns a completion code of 63 (OPT.TCC=63), ensure that DRAEH.E63 is also set for a shadow region completion interrupt because the interrupt pending register bit set will be IPRH.I63 (not IPR.I0).</p>

### 11.5.2 Miscellaneous Programming/Debug Tips

1. For several registers, the setting and clearing of bits needs to be done via separate dedicated registers. For example, the Event Register (ER/ERH) can only be cleared by writing a 1 to the corresponding bits in the Event Clear Registers (ECR/ECRH). Similarly, the Event Enable Register (EER/EERH) bits can only be set with writes of 1 to the Event Enable Set Registers (EESR/EESRH) and cleared with writes of 1 to the corresponding bits in the Event Enable Clear Register (EECR/EECRH).
2. Writes to the shadow region memory maps are governed by region access registers (DRAE/DRAEH/QRAE). If the appropriate channels are not enabled in these registers, read/write access to the shadow region memory map is not enabled.
3. When working with shadow region completion interrupts, ensure that the DMA Region Access Registers (DRAE/DRAEH) for every region are set in a mutually exclusive way (unless it is a requirement for an application). If there is an overlap in the allocated channels and transfer completion codes (setting of Interrupt Pending Register bits) in the region resource allocation, it results in multiple shadow region completion interrupts. For example, if DRAE0.E0 and DRAE1.E0 are both set, then on completion of a transfer that returns a TCC=0, they will generate both shadow region 0 and 1 completion interrupts.
4. While programming a non-dummy parameter set, ensure the CCNT is not left to zero.
5. Enable the EDMA3CC error interrupt in the device controller and attach an interrupt service routine (ISR) to ensure that error conditions are not missed in an application and are appropriately addressed with the ISR.
6. Depending on the application, you may want to break large transfers into smaller transfers and use self-chaining to prevent starvation of other events in an event queue.
7. In applications where a large transfer is broken into sets of small transfers using chaining or other methods, you might choose to use the early chaining option to reduce the time between the sets of transfers and increase the throughput. However, keep in mind that with early completion, all data might have not been received at the end point when completion is reported because the EDMA3CC internally signals completion when the TR is submitted to the EDMA3TC, potentially before any data has been transferred.
8. The event queue entries can be observed to determine the last few events if there is a system failure (provided the entries were not bypassed).

### 11.5.3 Setting Up a Transfer

The following list provides a quick guide for the typical steps involved in setting up a transfer.

**Step 1. Initiating a DMA/QDMA channel**

- (a) Determine the type of channel (QDMA or DMA) to be used.
- (b) Channel mapping
  - (i) If using a QDMA channel, program the QCHMAP with the parameter set number to which the channel maps and the trigger word.
  - (ii) If using a DMA channel, program the DCHMAP with the parameter set number to which the channel maps.
- (c) If the channel is being used in the context of a shadow region, ensure the DRAE/DRAEH for the region is properly set up to allow read write accesses to bits in the event registers and interrupt registers in the Shadow region memory map. The subsequent steps in this process should be done using the respective shadow region registers. (Shadow region descriptions and usage are provided in [Section 11.3.7.1](#).)
- (d) Determine the type of triggering used.
  - (i) If external events are used for triggering (DMA channels), enable the respective event in EER/EERH by writing into EESR/EESRH.
  - (ii) If QDMA Channel is used, enable the channel in QEER by writing into QEESR.
- (e) Queue setup
  - (i) If a QDMA channel is used, set up the QDMAQNUM to map the channel to the respective event queue.
  - (ii) If a DMA channel is used, set up the DMAQNUM to map the event to the respective event queue.

**Step 2. Parameter set setup**

- (a) Program the PaPARAM set number associated with the channel. Note that if it is a QDMA channel, the PaPARAM entry that is configured as trigger word is written to last. Alternatively, enable the QDMA channel (step 1-b-ii above) just before the write to the trigger word.  
See [Section 11.3.19](#) for parameter set field setups for different types of transfers. See the sections on chaining ([Section 11.3.8](#)) and interrupt completion ([Section 11.3.9](#)) on how to set up final/intermediate completion chaining and/or interrupts.

**Step 3. Interrupt setup**

- (a) Enable the interrupt in the IER/IERH by writing into IESR/IESRH.
- (b) Ensure that the EDMA3CC completion interrupt (either the global or the shadow region interrupt) is enabled properly in the device interrupt controller.
- (c) Ensure the EDMA3CC completion interrupt (this refers to either the Global interrupt or the shadow region interrupt) is enabled properly in the Device Interrupt controller.
- (d) Set up the interrupt controller properly to receive the expected EDMA3 interrupt.

**Step 4. Initiate transfer**

(a) This step is highly dependent on the event trigger source:

- (i) If the source is an external event coming from a peripheral, the peripheral will be enabled to start generating relevant EDMA3 events that can be latched to the ER transfer.
- (ii) For QDMA events, writes to the trigger word (step 2-a above) will initiate the transfer.
- (iii) Manually triggered transfers will be initiated by writes to the Event Set Registers (ESR/ESRH).
- (iv) Chained-trigger events initiate when a previous transfer returns a transfer completion code equal to the chained channel number.

**Step 5. Wait for completion**

- (a) If the interrupts are enabled as mentioned in step 3 above, then the EDMA3CC will generate a completion interrupt to the CPU whenever transfer completion results in setting the corresponding bits in the interrupt pending register (IPR/IPRH). The set bits must be cleared in the IPR\IPRH by writing to corresponding bit in ICR\ICRH.
- (b) If polling for completion (interrupts not enabled in the device controller), then the application code can wait on the expected bits to be set in the IPR\IPRH. Again, the set bits in the IPR\IPRH must be manually cleared via ICR\ICRH before the next set of transfers is performed for the same transfer completion code values.

## Touchscreen Controller

---

---

---

This chapter describes the touchscreen controller of the device.

Topic	Page
<b>12.1 Introduction .....</b>	<b>1023</b>
<b>12.2 Integration .....</b>	<b>1024</b>
<b>12.3 Functional Description .....</b>	<b>1026</b>
<b>12.4 Operational Modes .....</b>	<b>1029</b>
<b>12.5 Touchscreen Controller Registers .....</b>	<b>1033</b>

## 12.1 Introduction

The touchscreen controller and analog-to-digital converter subsystem (TSC\_ADC\_SS) is an 8-channel general-purpose analog-to-digital converter (ADC) with optional support for interleaving touchscreen (TS) conversions for a 4-wire, 5-wire, or 8-wire resistive panel. The TSC\_ADC\_SS can be configured for use in one of the following applications:

- 8 general-purpose ADC channels
- 4-wire TSC with 4 general-purpose ADC channels
- 5-wire TSC with 3 general-purpose ADC channels
- 8-wire TSC

### 12.1.1 TSC\_ADC Features

The main features of the TSC\_ADC\_SS include:

- Support for 4-wire, 5-wire, and 8-wire resistive TS panels
- Support for interleaving TS capture and general-purpose ADC modes
- Programmable FSM sequencer that supports 16 steps:
  - Software register bit for start of conversion
  - Optional start of conversion HW synchronized to Pen touch or external HW event (but not both)
  - Single conversion (one-shot)
  - Continuous conversions
  - Sequence through all input channels based on a mask
  - Programmable OpenDelay before sampling each channel
  - Programmable sampling delay for each channel
  - Programmable averaging of input samples - 16/8/4/2/1
  - Differential or singled ended mode setting for each channel
  - Store data in either of two FIFO groups
  - Option to encode channel number with data
  - Support for servicing FIFOs via DMA or CPU
  - Programmable DMA Request event (for each FIFO)
  - Dynamically enable or disable channel inputs during operation
  - Stop bit to end conversion
- Support for the following interrupts and status, with masking:
  - Interrupt for HW pen (touch) event
  - Interrupt for HW Pen Up event
  - Interrupt after a sequence of conversions (all non-masked channels)
  - Interrupt for FIFO threshold levels
  - Interrupt if sampled data is out of a programmable range
  - Interrupt for FIFO overflow and underflow conditions
  - Status bit to indicate if ADC is busy converting

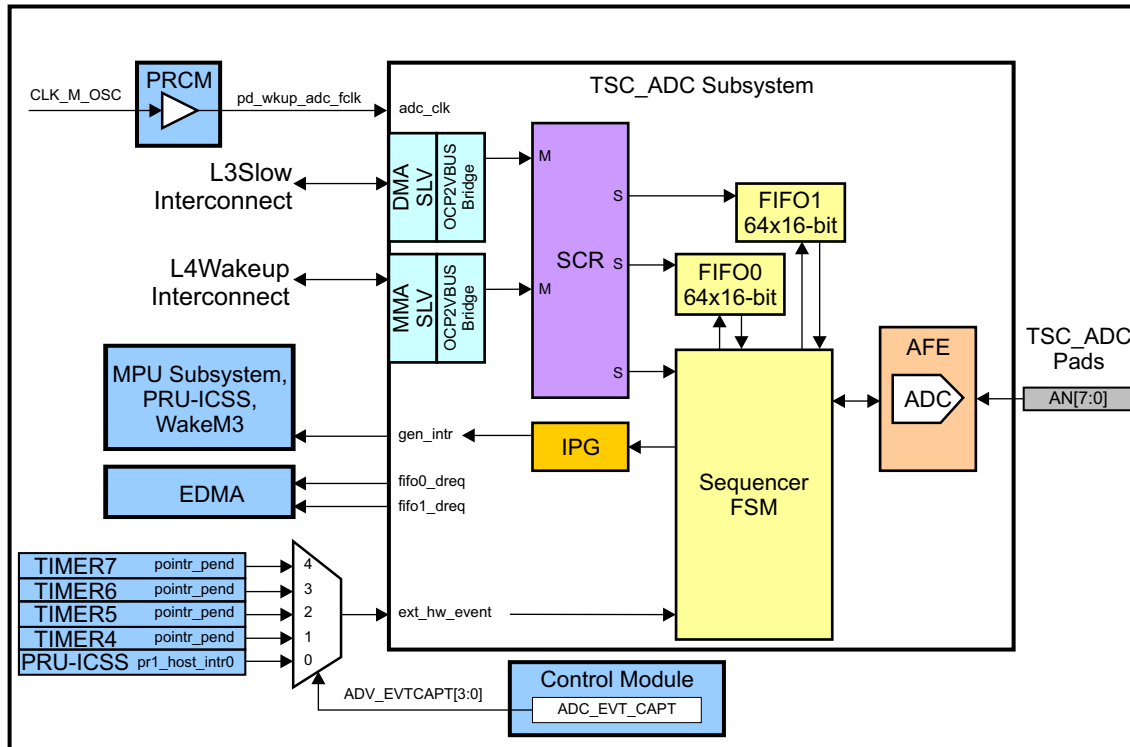

### 12.1.2 Unsupported TSC\_ADC\_SS Features

This device supports all TSC\_ADC\_SS features.

## 12.2 Integration

Figure 12-1 shows the integration of the TSC\_ADC module in the device.

Figure 12-1. TSC\_ADC Integration

pr1\_host\_intr[0:7] corresponds to Host-2 to Host-9 of the PRU-ICSS interrupt controller.

### 12.2.1 TSC\_ADC Connectivity Attributes

The general connectivity attributes for the TSC\_ADC module are summarized in Table 12-1.

Table 12-1. TSC\_ADC Connectivity Attributes

Attributes	Type
Power domain	Wakeup Domain
Clock domain	PD_WKUP_L4_WKUP_GCLK (OCP) PD_WKUP_ADC_FCLK (Func)
Reset signals	WKUP_DOM_RST_N
Idle/Wakeup signals	Smart idle Wakeup
Interrupt request	1 interrupt to MPU Subsystem (ADC_TSC_GENINT), PRU-ICSS (gen_intr_pend), and WakeM3
DMA request	2 Events (tsc_adc_FIFO0, tsc_adc_FIFO1)
Physical address	L3 Slow slave port (DMA) L4 Wkup slave port (MMR)

### 12.2.2 TSC\_ADC Clock and Reset Management

The TSC\_ADC has two clock domains. The ADC uses the `adc_clk`. The bus interfaces, FIFOs, sequencer, and all other logic use the `ocp_clk`.

**Table 12-2. TSC\_ADC Clock Signals**

Clock Signal	Max Freq	Reference / Source	Comments
<code>ocp_clk</code> OCP / Functional clock	100 MHz	CORE_CLKOUTM4 / 2	<code>pd_pwkup_l4_wkup_gclk</code> From PRCM
<code>adc_clk</code> ADC clock	24 MHz (typ)	CLK_M_OSC	<code>pd_wkup_adc_fclk</code> From PRCM

### 12.2.3 TSC\_ADC Pin List

The TSC\_ADC external interface signals are shown in [Table 12-3](#).

**Table 12-3. TSC\_ADC Pin List**

Pin	Type	Description
AN[7:0]	I	Analog Input
VREFN	Power	Analog Reference Input Negative Terminal
VREFP	Power	Analog Reference Input Positive Terminal

## 12.3 Functional Description

Before enabling the TSC\_ADC\_SS module, the user must first program the Step Configuration registers in order to configure a channel input to be sampled. There are 16 programmable Step Configuration registers which are used by the sequencer to control which switches to turn on or off (inputs to the AFE), which channel to sample, and which mode to use (HW triggered or SW enabled, one-shot or continuous, averaging, where to save the FIFO data, etc).

### 12.3.1 HW Synchronized or SW Channels

The user can control the start behavior of each channel input by deciding if a channel should be sampled immediately (SW enabled) after it is enabled, or if the channel should wait for a HW event to occur first ( a HW event must either be mapped to the touch screen PEN event or mapped to the HW event input signal, but not both). Each channel input can be configured independently via the Step Configuration register.

### 12.3.2 Open Delay and Sample Delay

The user can program the delay between driving the inputs to the AFE and the time to send the start of conversion signal. This delay can be used to allow the voltages to stabilize on the touch screen panel before sampling. This delay is called “open delay” and can also be programmed to zero. The user also has control of the sampling time (width of the start of conversion signal) to the AFE which is called the “sample delay”. Each channel input is configured independently via the Step Delay register.

### 12.3.3 Averaging of Samples (1, 2, 4, 8, and 16)

Each channel input has the capability to average the sampled data. The valid averaging options are 1 (no average), 2, 4, 8, and 16. If averaging is turned on, then the channel is immediately sampled again (up to 16 times) and final averaged sample data is stored in the FIFO. Each channel input can be independently configured via the Step Configuration registers.

### 12.3.4 One-Shot (Single) or Continuous Mode

When the sequencer finishes cycling through all the enabled steps, the user can decide if the sequencer should stop (one-shot), or loop back and schedule a the step again (continuous).

If one-shot mode is selected, the sequencer will take care of disabling the step enable bit after the conversion. If continuous mode is selected, it is the software’s responsibility to turn off the step enable bit.

### 12.3.5 Interrupts

The following interrupts are supported via enable bits and are maskable.

The HW Pen (Touch) interrupt is generated when the user presses the touchscreen. This can only occur if the AFE is configured properly (i.e., one of the Pen Ctrl bits must be enabled, and also the correct setting for a path to ground in the StepConfig Registers). Although the HW Pen interrupt can be disabled by the SW, the event will still trigger the sequencer to start if the step is configured as a HW synchronized event. The HW Pen interrupt is an asynchronous event and can be used even if the TSC\_ADC\_SS clocks are disabled. The HW Pen interrupt can be used to as a wakeup source.

An END\_OF\_SEQUENCE interrupt is generated after the sequencer finishes servicing the last enabled step.

A PEN\_UP interrupt generates only if the HW steps are used and the Charge step must be enabled. If a HW Pen event caused the HW steps to be scheduled and no HW Pen (touch) is active after the sequencer finished servicing the charge step, then a PEN\_UP interrupt is generated. To detect PEN\_UP interrupts, the charge step must share the same configuration as the idle step.

Each FIFO has support for generating interrupts when the FIFO word count has reached a programmable threshold level. The user can program these registers to the desired word count at which the CPU should be interrupted. Whenever the threshold counter value is reached, it sets the FIFO THRESHOLD interrupt flag, and the CPU is interrupted if the FIFO THRESHOLD interrupt enable bit is set. The user can clear the interrupt flag, after emptying the FIFO, by writing a '1' to the FIFO TRESHOLD interrupt status bit. To determine how many samples are currently in the FIFO at a given moment, the FIFO\_WORD\_COUNT register can be read by the CPU.

The FIFO can also generate FIFO\_OVERRUN and FIFO\_UNDERFLOW interrupts. The user can mask these events by programming the enable bits. To clear a FIFO underflow or FIFO overrun interrupt, the user should write a '1' to the status bit. The TSC\_ADC\_SS does not recover from these conditions automatically. Therefore, the software will need to disable and then again enable the TSC\_ADC\_SS. Before user can turn the module back on, he must first check if the ADC FSM is in IDLE state by reading from the ADC\_STATUS\_REG register.

### 12.3.6 DMA Requests

Each FIFO group can be serviced by either a DMA or by the CPU. To generate DMA requests, the user must set the enable bit in the DMAENABLE\_SET Register. Also, the user can program the desired number of words to generate a DMA request using the DMAxREQ register. When the FIFO level reaches or exceeds that value, a DMA request is generated.

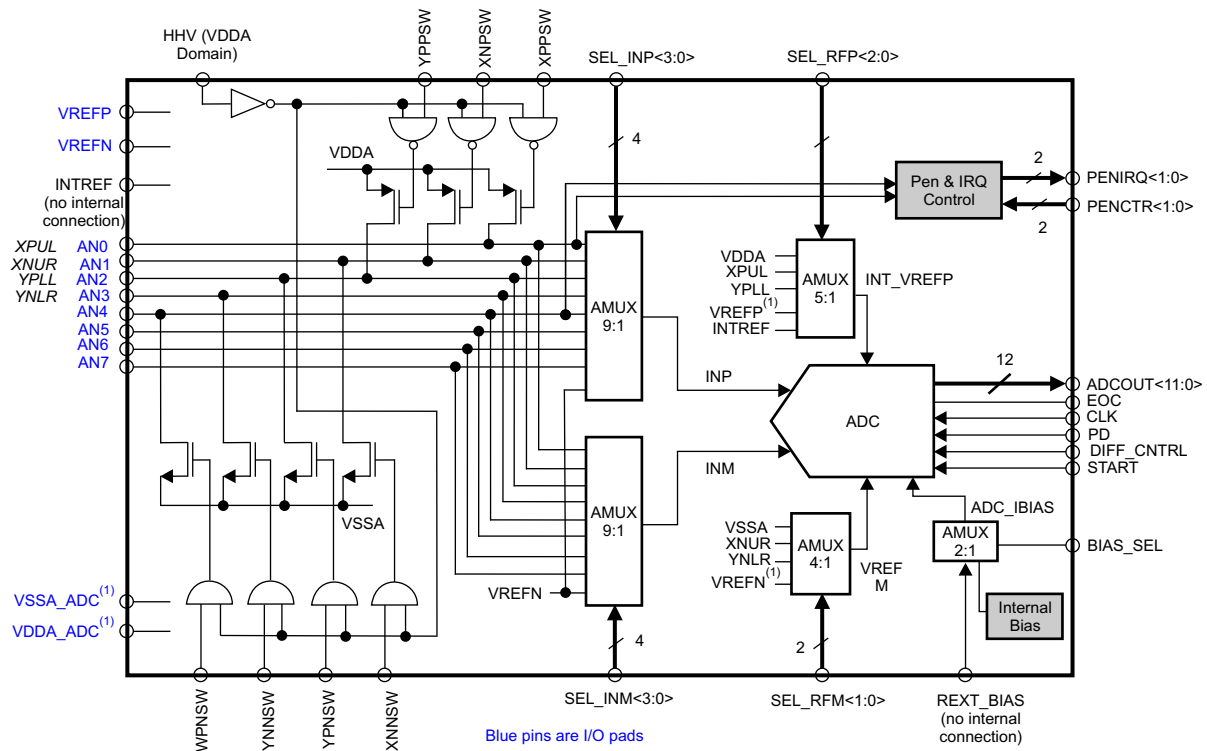

The DMA slave port allows for burst reads in order to effectively move the FIFO data. Internally, the OCP DMA address (MSB) is decoded for either FIFO 0 or FIFO 1. The lower bits of the DMA addresses are ignored since the FIFO pointers are incremented internally.

### 12.3.7 Analog Front End (AFE) Functional Block Diagram

The AFE features are listed below, and some are controlled by the TSC\_ADC\_SS:

- 12-bit ADC
- Sampling rate can be as fast as every 15 ADC clock cycles
- Support for internal ADC clock divider logic
- Support for configuring the delay between samples also the sampling time

Figure 12-2. Functional Block Diagram

(1) In AM335x ARM Cortex-A8 Microprocessors (MPUs) (literature number [SPRS717](#)):

- VDDA\_ADC and VSSA\_ADC are referred to as "Internal References"
- VREFP and VREFN are referred to as "External References"

(2) In AM438x ARM Cortex-A9 Microprocessors (MPUs) (literature number [SPRS889](#)):

- VDDA\_ADC and VSSA\_ADC are referred to as "Internal References"
- VREFP and VREFN are referred to as "External References"

## 12.4 Operational Modes

The sequencer is completely controlled by software and behaves accordingly to how the **Step Registers** are programmed. A **step** is the general term for sampling a channel input. It is defined by the programmer who decides which input values to send to the AFE (via the StepConfig register), and also how (via StepConfig register) and when (via StepDelay register) to sample a channel input.

A step consists of these three registers:

- StepEnable: Enables or disables the step
- StepConfig: Controls the input values to the ADC (the reference voltages, the pull up/down transistor biasing, which input channel to sample, differential control, HW synchronized or SW enabled, averaging, and which FIFO group to save the data)
- StepDelay: Controls the OpenDelay (the time between driving the AFE inputs until sending the SOC signal to the AFE), and also controls the SampleDelay (the time for the ADC to sample the input signal)

The sequencer supports a total of 16 programmable steps, a touchscreen Charge step, and an Idle step. Each step consists of the three registers above (StepEnable, StepConfig, and StepDelay), except the Idle step does not have a StepEnable bit (it must always be on), and it also does not have a StepDelay register. Also, during the Idle and touchscreen Charge steps, the ADC does not actually sample a channel.

Assuming all the steps are configured as general purpose mode (no touchscreen), then the steps would be configured as SW enabled. When the TSC\_ADC\_SS is first enabled, the sequencer will always start in the Idle step and then wait for a StepEnable[n] bit to turn on. After a step is enabled, the sequencer will start with the lowest step (1) and continue until step (16). If a step is not enabled, then sequencer will skip to the next step. If all steps are disabled, then the sequencer will remain in the IDLE state and continue to apply the Idle StepConfig settings.

Assuming a touchscreen-only mode (no general-purpose channels) the steps could be configured as HW synchronized triggered (mapped to the Pen event). The sequencer would wait in the IDLE state until a HW pen down event occurred and then begin the HW step conversions. The touchscreen Charge step occurs after the last HW step before going back to the Idle state (the TS Charge step is needed to charge touch screen capacitance which allows the controller to detect subsequent Pen touch events).

Assuming a mixed mode application (touchscreen and general purpose channels), the user can configure the steps as either HW triggered (mapped to Pen event) or SW enabled. If the sequencer is in the IDLE state and a HW pen event occurs, then the HW steps (from lowest to highest) are always scheduled first, followed by the TS Charge step. If there is no HW event, then the SW enabled steps are scheduled instead

If a HW event occurs while the sequencer is in the middle of scheduling the SW steps, the user can program the scheduler to allow preemption. If the HW preempt control bit is enabled, the sequencer will allow the current SW step to finish and then schedule the HW steps. After the last HW step and TS Charge step are completed, the sequencer will continue from the next SW step (before the preemption occurred). If the HW preemption is disabled, then the touch event will be ignored until the last software step is completed; if the touch event is removed before the last software step is finished, then the touch event will be missed.

Even if a touchscreen is not present, the user can still configure the steps to be HW-synchronized by mapping to the HW event input signal. This HW event input signal could be driven at the SOC level from a timer interrupt or some other IP and can be used to start a channel conversion.

When mapping is set for the input HW event signal, then the TSC\_ADC\_SS will wait for a rising edge transition (from low to high) before starting. The input HW event signal is captured on the internal L4 OCP clock domain. The HW event input signal should be held for at least 2 TSC\_ADC\_SS OCP clocks (L4 frequency).

An END\_OF\_SEQUENCE interrupt is generated after the last active step is completed before going back to the IDLE state. The END\_OF\_SEQUENCE interrupt does not mean data is in the FIFO (should use the FIFO interrupts and word count reg)

### 12.4.1 PenCtrl and PenIRQ

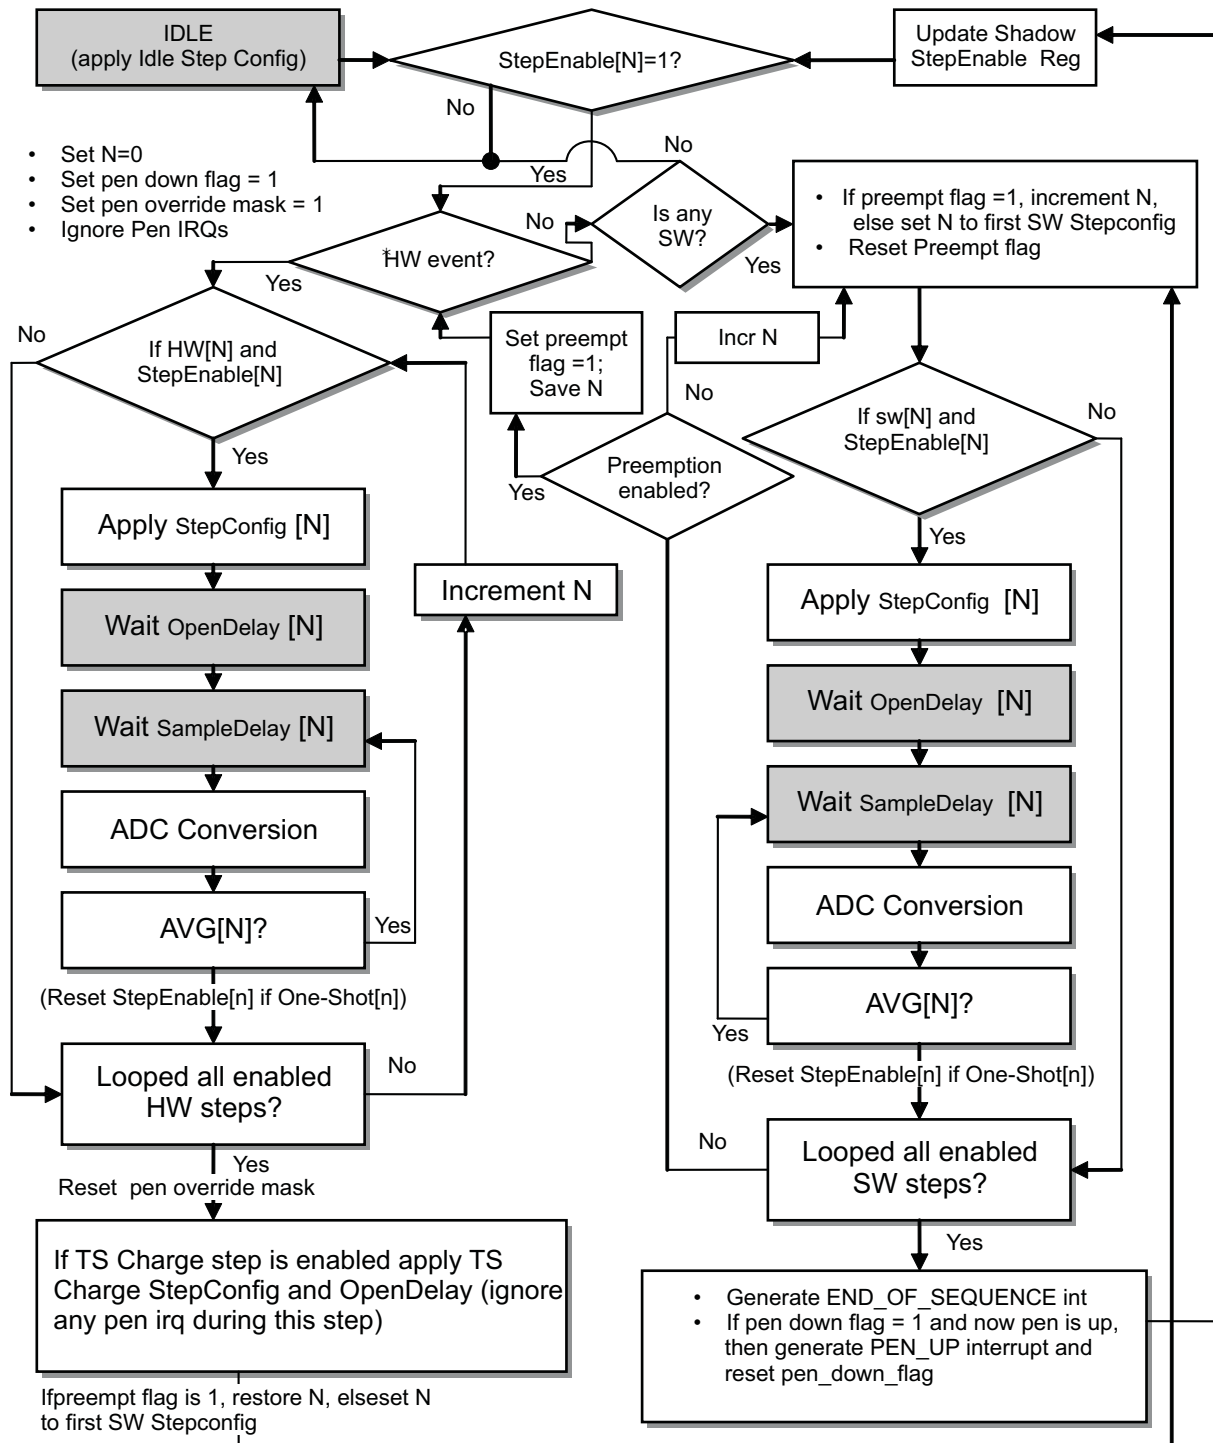

The Pen IRQ can only occur if the correct AFE\_Pen\_Ctrl bits are high in the CTRL register and if the correct ground transistor biasing is set in the StepConfig[n] Register. Refer to the application notes for the correct settings.

If a step is configured as HW-synchronized, the sequencer will override the AFE\_Pen\_Ctrl bits set by the software (bits 6:5) once it transitions from the IdleStep. The sequencer will automatically mask the AFE\_Pen\_Ctrl bits (override them and turn them off) so that the ADC can get an accurate measurement from the x and y channels. After the last HW synchronized step, the sequence will go to the Charge step and the pen override mask is removed and the values set by the software (bits 6:5) will have control. The HW Pen events will be temporarily ignored during the Charge step (HW will mask any potential glitches that may occur)

If the sequencer is not using the HW synchronized approach, (all the steps are configured as software enabled), then it is the software programmer's responsibility to correctly turn on and off the AFE\_Pen\_Ctrl bits to receive the correct measurements from the touchscreen. The software must enable the Charge step and ignore any potential glitches.

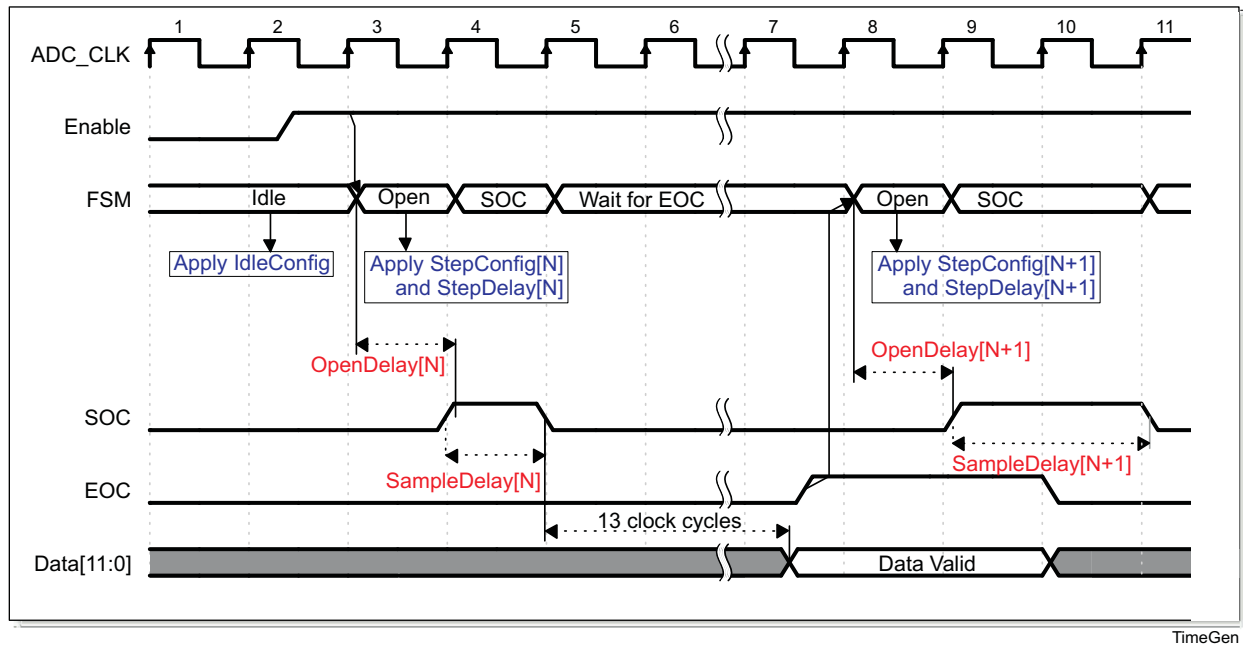

It is also possible to detect the HW Pen event even if all the StepEnable[n] bits are off. By setting the AFE\_Ctrl\_Pin bit to 1, and configuring the IdleStep Configuration register to correctly bias the transistor to ground, the HW\_Pen event will be generated. The flowchart for the sequencer is shown in [Figure 12-3](#) and an example timing diagram in [Figure 12-4](#).

Figure 12-3. Sequencer FSM

\* HW event can either be Pen touch, or input HW event, but not both

The previous diagram does not actually represent clock cycles but instead illustrates how the scheduler will work. However, each shaded box above does represent a FSM state and will use a clock cycle. Using the minimum delay values, the ADC can sample at 15 ADC clocks per sample. Below is an example timing diagram illustrating the states of the sequencer and also the showing when the StepConfig and the StepDelay registers values are applied. The below example assumes the steps are software controlled, and averaging is turned off.

**Figure 12-4. Example Timing Diagram for Sequencer**

The Idle StepConfig is always enabled and applied when the FSM is in the IDLE state (i.e., either waiting for a HW event or waiting for a step to be enabled). The Idle StepConfig can not be disabled.

Once the TSC\_ADC\_SS is enabled and assuming at least one StepEnable[N] is active, the FSM will transition from the Idle state and apply the first active StepConfig[N] and StepDelay[N] register settings. It is possible for the OpenDelay[N] value to be 0, and therefore the FSM will immediately skip to the SampleDelay[N] state (which is minimum 1 clock cycle). The ADC will begin the sampling on the falling edge of the SOC signal. After the ADC is finished converting the channel data (13 cycles later), the EOC signal is sent and the FSM will then apply the next active step [N+1].

This process is repeated and continued (from step 1 to step 16) until the last active step is completed.

## 12.5 Touchscreen Controller Registers

### 12.5.1 TSC\_ADC\_SS Registers

Table 12-4 lists the memory-mapped registers for the TSC\_ADC\_SS. All register offset addresses not listed in Table 12-4 should be considered as reserved locations and the register contents should not be modified.

7	FIFO1_Underflow	R/W	0h	Write 0 = No action. Read 0 = Interrupt disabled (masked). Read 1 = Interrupt enabled. Write 1 = Enable interrupt.
6	FIFO1_Overrun	R/W	0h	Write 0 = No action. Read 0 = Interrupt disabled (masked). Read 1 = Interrupt enabled. Write 1 = Enable interrupt.
5	FIFO1_Threshold	R/W	0h	Write 0 = No action. Read 0 = Interrupt disabled (masked). Read 1 = Interrupt enabled. Write 1 = Enable interrupt.
4	FIFO0_Underflow	R/W	0h	Write 0 = No action. Read 0 = Interrupt disabled (masked). Read 1 = Interrupt enabled. Write 1 = Enable interrupt.
3	FIFO0_Overrun	R/W	0h	Write 0 = No action. Read 0 = Interrupt disabled (masked). Read 1 = Interrupt enabled. Write 1 = Enable interrupt.

**Table 12-9. IRQENABLE\_SET Register Field Descriptions (continued)**

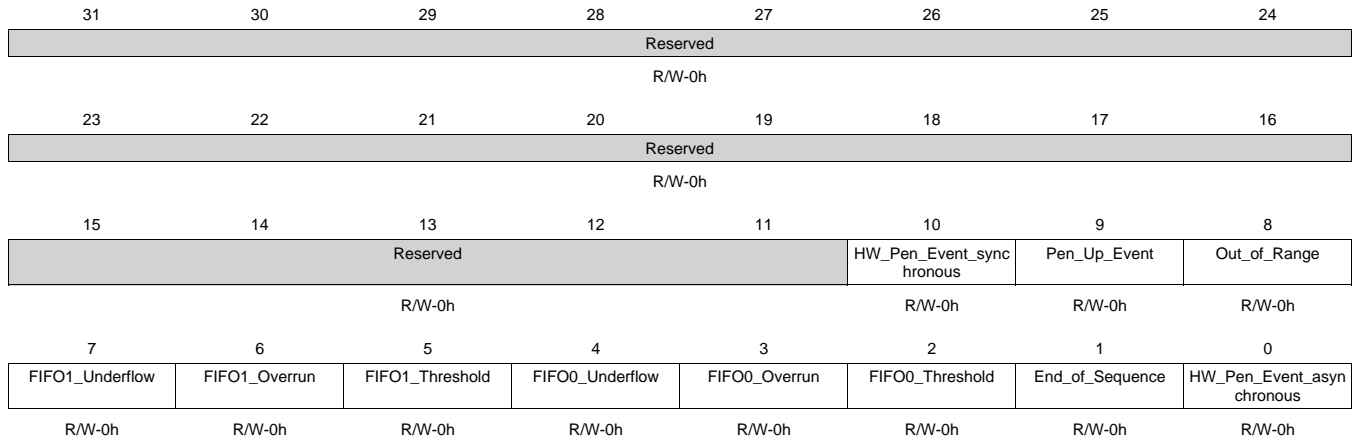

Bit	Field	Type	Reset	Description
2	FIFO0_Threshold	R/W	0h	Write 0 = No action. Read 0 = Interrupt disabled (masked). Read 1 = Interrupt enabled. Write 1 = Enable interrupt.
1	End_of_Sequence	R/W	0h	Write 0 = No action. Read 0 = Interrupt disabled (masked). Read 1 = Interrupt enabled. Write 1 = Enable interrupt.
0	HW_Pen_Event_asynchronous	R/W	0h	Write 0 = No action. Read 0 = Interrupt disabled (masked). Read 1 = Interrupt enabled. Write 1 = Enable interrupt.

### 12.5.1.6 IRQENABLE\_CLR Register (offset = 30h) [reset = 0h]

IRQENABLE\_CLR is shown in [Figure 12-10](#) and described in [Table 12-10](#).

IRQ enable clear bits

**Figure 12-10. IRQENABLE\_CLR Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 12-10. IRQENABLE\_CLR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-11	Reserved	R/W	0h	
10	HW_Pen_Event_synch ronous	R/W	0h	Write 0 = No action. Read 0 = Interrupt disabled (masked). Read 1 = Interrupt enabled. Write 1 = Disable interrupt.
9	Pen_Up_Event	R/W	0h	Write 0 = No action. Read 0 = Interrupt disabled (masked). Read 1 = Interrupt enabled. Write 1 = Disable interrupt.
8	Out_of_Range	R/W	0h	Write 0 = No action. Read 0 = Interrupt disabled (masked). Read 1 = Interrupt enabled. Write 1 = Disable interrupt.
7	FIFO1_Underflow	R/W	0h	Write 0 = No action. Read 0 = Interrupt disabled (masked). Read 1 = Interrupt enabled. Write 1 = Disable interrupt.
6	FIFO1_Overrun	R/W	0h	Write 0 = No action. Read 0 = Interrupt disabled (masked). Read 1 = Interrupt enabled. Write 1 = Disable interrupt.
5	FIFO1_Threshold	R/W	0h	Write 0 = No action. Read 0 = Interrupt disabled (masked). Read 1 = Interrupt enabled. Write 1 = Disable interrupt.
4	FIFO0_Underflow	R/W	0h	Write 0 = No action. Read 0 = Interrupt disabled (masked). Read 1 = Interrupt enabled. Write 1 = Disable interrupt.
3	FIFO0_Overrun	R/W	0h	Write 0 = No action. Read 0 = Interrupt disabled (masked). Read 1 = Interrupt enabled. Write 1 = Disable interrupt.

**Table 12-10. IRQENABLE\_CLR Register Field Descriptions (continued)**

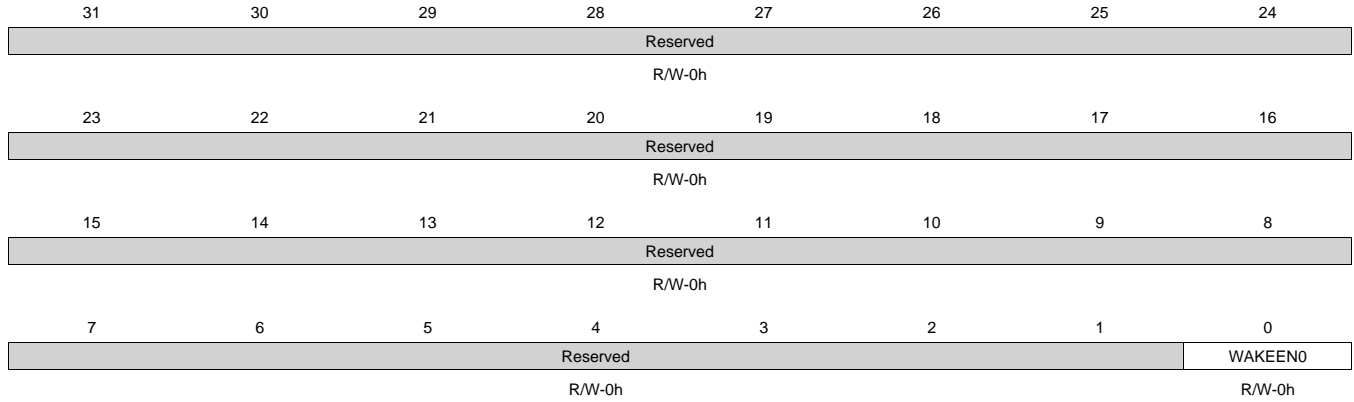

Bit	Field	Type	Reset	Description
2	FIFO0_Threshold	R/W	0h	Write 0 = No action. Read 0 = Interrupt disabled (masked). Read 1 = Interrupt enabled. Write 1 = Disable interrupt.
1	End_of_Sequence	R/W	0h	Write 0 = No action. Read 0 = Interrupt disabled (masked). Read 1 = Interrupt enabled. Write 1 = Disable interrupt.
0	HW_Pen_Event_asynchronous	R/W	0h	Write 0 = No action. Read 0 = Interrupt disabled (masked). Read 1 = Interrupt enabled. Write 1 = Disable interrupt.

**12.5.1.7 IRQWAKEUP Register (offset = 34h) [reset = 0h]**

IRQWAKEUP is shown in [Figure 12-11](#) and described in [Table 12-11](#).

IRQ wakeup enable

**Figure 12-11. IRQWAKEUP Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

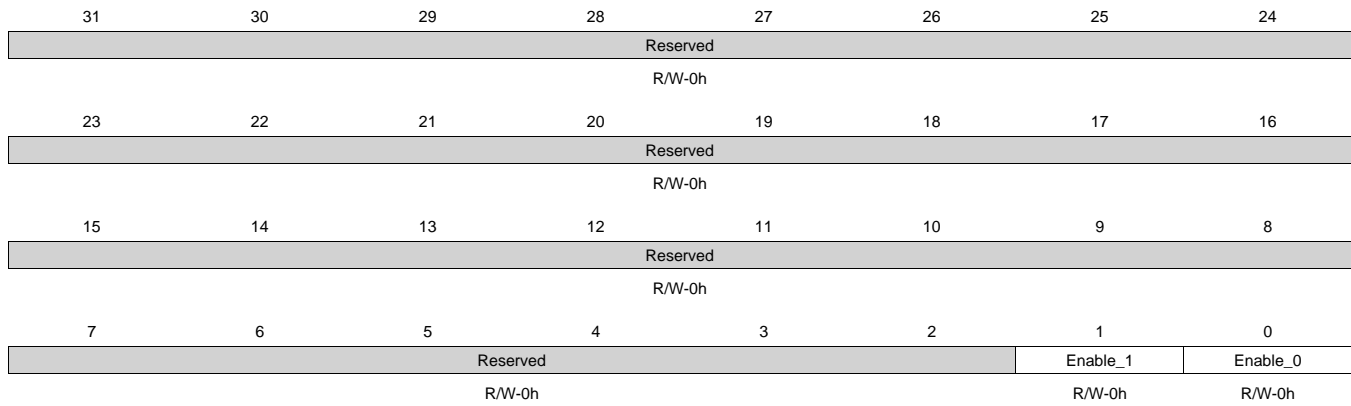

**Table 12-11. IRQWAKEUP Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-1	Reserved	R/W	0h	
0	WAKEENO	R/W	0h	Wakeup generation for HW Pen event. 0 = Wakeup disabled. 1 = Wakeup enabled.

**12.5.1.8 DMAENABLE\_SET Register (offset = 38h) [reset = 0h]**

 DMAENABLE\_SET is shown in [Figure 12-12](#) and described in [Table 12-12](#).

Per-Line DMA set

**Figure 12-12. DMAENABLE\_SET Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 12-12. DMAENABLE\_SET Register Field Descriptions**

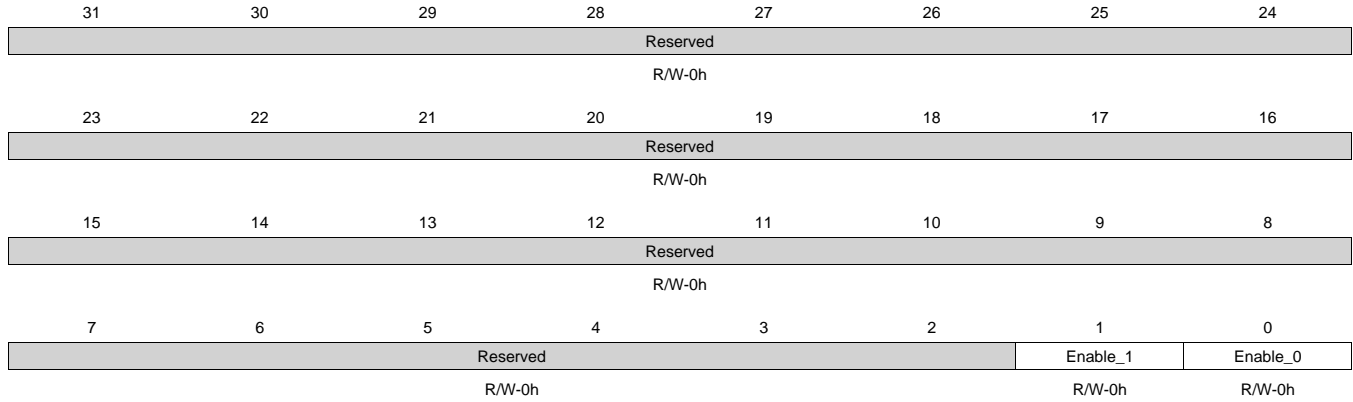

Bit	Field	Type	Reset	Description
31-2	Reserved	R/W	0h	
1	Enable_1	R/W	0h	Enable DMA request FIFO 1. Write 0 = No action. Read 0 = DMA line disabled. Read 1 = DMA line enabled. Write 1 = Enable DMA line.
0	Enable_0	R/W	0h	Enable DMA request FIFO 0. Write 0 = No action. Read 0 = DMA line disabled. Read 1 = DMA line enabled. Write 1 = Enable DMA line.

**12.5.1.9 DMAENABLE\_CLR Register (offset = 3Ch) [reset = 0h]**

DMAENABLE\_CLR is shown in [Figure 12-13](#) and described in [Table 12-13](#).

Per-Line DMA clr

**Figure 12-13. DMAENABLE\_CLR Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

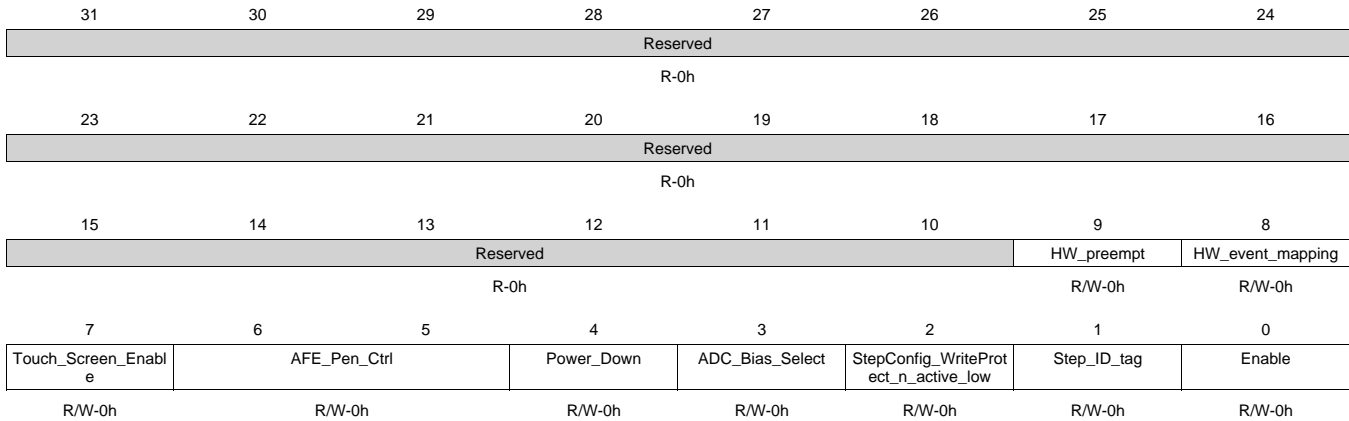

**Table 12-13. DMAENABLE\_CLR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	Reserved	R/W	0h	
1	Enable_1	R/W	0h	Disable DMA request FIFO 1. Write 0 = No action. Read 0 = DMA line disabled. Read 1 = DMA line enabled. Write 1 = Disable DMA line.
0	Enable_0	R/W	0h	Disable DMA request FIFO 0. Write 0 = No action. Read 0 = DMA line disabled. Read 1 = DMA line enabled. Write 1 = Disable DMA line.

**12.5.1.10 CTRL Register (offset = 40h) [reset = 0h]**

 CTRL is shown in [Figure 12-14](#) and described in [Table 12-14](#).

@TSC\_ADC\_SS Control Register

**Figure 12-14. CTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 12-14. CTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-10	Reserved	R	0h	
9	HW_preempt	R/W	0h	0 = SW steps are not pre-empted by HW events. 1 = SW steps are pre-empted by HW events
8	HW_event_mapping	R/W	0h	0 = Map HW event to Pen touch irq (from AFE). 1 = Map HW event to HW event input.
7	Touch_Screen_Enable	R/W	0h	0 = Touchscreen transistors disabled. 1 = Touchscreen transistors enabled
6-5	AFE_Pen_Ctrl	R/W	0h	These two bits are sent directly to the AFE Pen Ctrl inputs. Bit 6 controls the Wiper touch (5 wire modes)Bit 5 controls the X+ touch (4 wire modes)User also needs to make sure the ground path is connected properly for pen interrupt to occur (using the StepConfig registers)Refer to section 4 interrupts for more information
4	Power_Down	R/W	0h	ADC Power Down control. 0 = AFE is powered up (default). 1 = Write 1 to power down AFE (the tsc_adc_ss enable (bit 0) should also be set to off)
3	ADC_Bias_Select	R/W	0h	Select Bias to AFE. 0 = Internal. 1 = Reserved.
2	StepConfig_WriteProtect_n_active_low	R/W	0h	0 = Step configuration registers are protected (not writable). 1 = Step configuration registers are not protected (writable).
1	Step_ID_tag	R/W	0h	Writing 1 to this bit will store the Step ID number with the captured ADC data in the FIFO. 0 = Write zeroes. 1 = Store the channel ID tag.
0	Enable	R/W	0h	TSC_ADC_SS module enable bit. After programming all the steps and configuration registers, write a 1 to this bit to turn on TSC_ADC_SS. Writing a 0 will disable the module (after the current conversion).

### 12.5.1.11 ADCSTAT Register (offset = 44h) [reset = 10h]

ADCSTAT is shown in [Figure 12-15](#) and described in [Table 12-15](#).

General Status bits @TSC\_ADC\_SS\_Sequencer\_Status Register

**Figure 12-15. ADCSTAT Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 12-15. ADCSTAT Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	Reserved	R	0h	-
7	PEN_IRQ1	R	0h	PEN_IRQ[1] status
6	PEN_IRQ0	R	0h	PEN_IRQ[0] status
5	FSM_BUSY	R	0h	Status of OCP FSM and ADC FSM. 0 = Idle. 1 = Busy.
4-0	STEP_ID	R	10h	Encoded values: 10000 = Idle. 10001 = Charge. 00000 = Step 1. 00001 = Step 2. 00010 = Step 3. 00011 = Step 4. 00100 = Step 5. 00101 = Step 6. 00110 = Step 7. 00111 = Step 8. 01000 = Step 9. 01001 = Step 10. 01010 = Step 11. 01011 = Step 12. 01100 = Step 13. 01101 = Step 14. 01110 = Step 15. 01111 = Step 16.

**12.5.1.12 ADCRANGE Register (offset = 48h) [reset = 0h]**

 ADCRANGE is shown in [Figure 12-16](#) and described in [Table 12-16](#).

High and Low Range Threshold@TSC\_ADC\_SS\_Range\_Check Register

**Figure 12-16. ADCRANGE Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

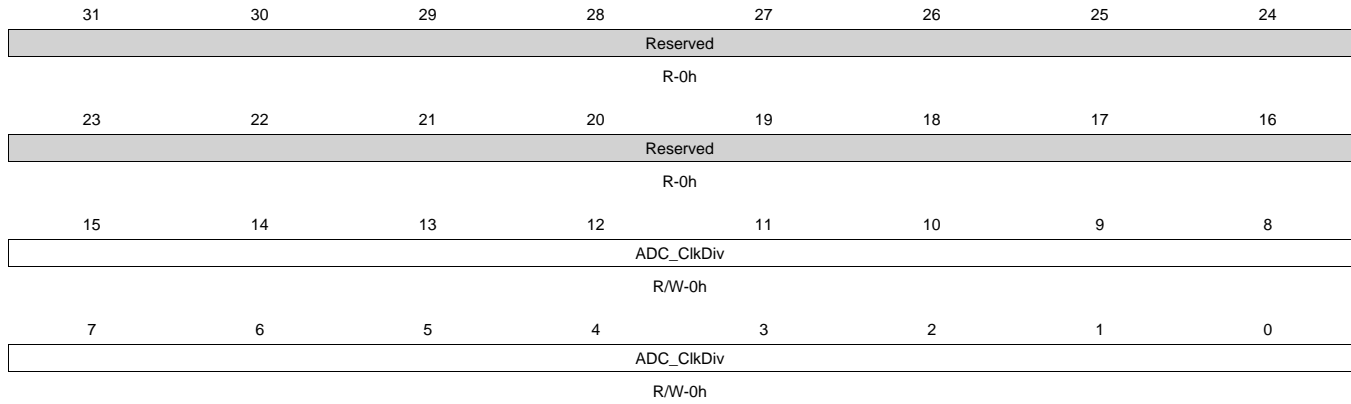

**Table 12-16. ADCRANGE Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-28	Reserved	R	0h	
27-16	High_Range_Data	R/W	0h	Sampled ADC data is compared to this value. If the sampled data is greater than the value, then an interrupt is generated.
15-12	Reserved	R	0h	Reserved.
11-0	Low_Range_Data	R/W	0h	Sampled ADC data is compared to this value. If the sampled data is less than the value, then an interrupt is generated.

**12.5.1.13 ADC\_CLKDIV Register (offset = 4Ch) [reset = 0h]**

ADC\_CLKDIV is shown in [Figure 12-17](#) and described in [Table 12-17](#).

ADC clock divider register@TSC\_ADC\_SS\_Clock\_Divider Register

**Figure 12-17. ADC\_CLKDIV Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

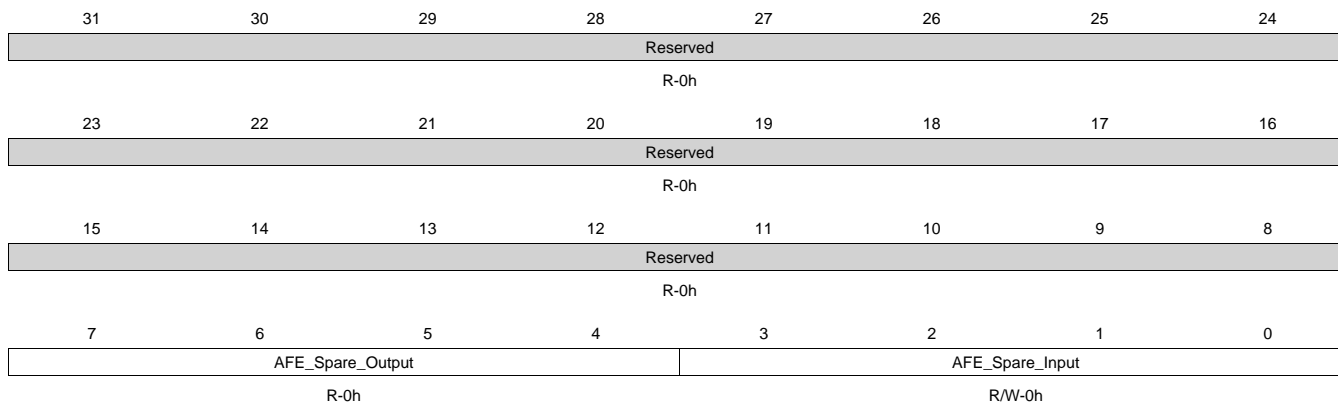

**Table 12-17. ADC\_CLKDIV Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	Reserved	R	0h	
15-0	ADC_ClkDiv	R/W	0h	The input ADC clock will be divided by this value and sent to the AFE. Program to the value minus 1

**12.5.1.14 ADC\_MISC Register (offset = 50h) [reset = 0h]**

ADC\_MISC is shown in [Figure 12-18](#) and described in [Table 12-18](#).

AFE misc debug@TSC\_ADC\_SS\_MISC Register

**Figure 12-18. ADC\_MISC Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 12-18. ADC\_MISC Register Field Descriptions**

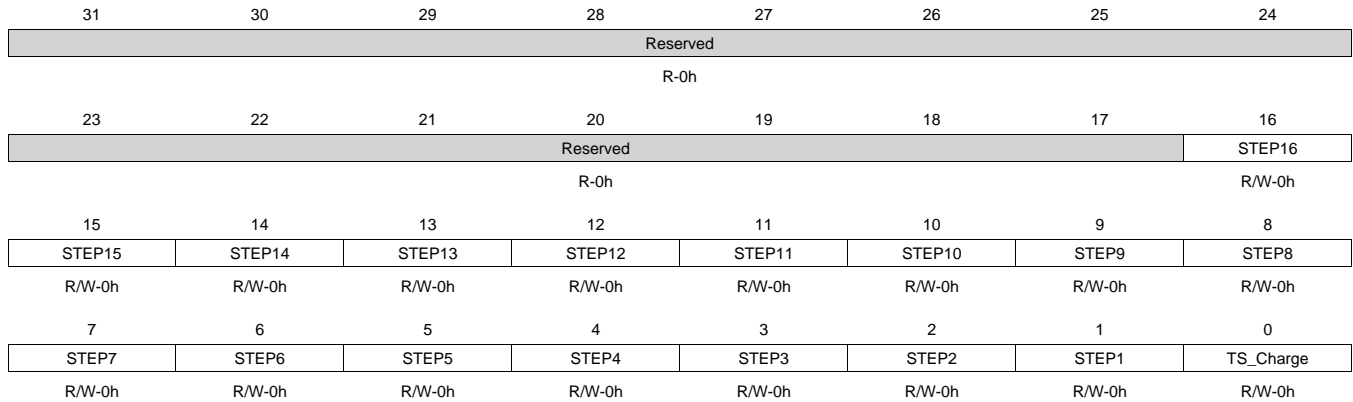

Bit	Field	Type	Reset	Description
31-8	Reserved	R	0h	RESERVED.
7-4	AFE_Spare_Output	R	0h	Connected to AFE Spare Output pins. Reserved in normal operation.
3-0	AFE_Spare_Input	R/W	0h	Connected to AFE Spare Input pins. Reserved in normal operation.

### 12.5.1.15 STEPENABLE Register (offset = 54h) [reset = 0h]

STEPENABLE is shown in [Figure 12-19](#) and described in [Table 12-19](#).

Step Enable

**Figure 12-19. STEPENABLE Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 12-19. STEPENABLE Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-17	Reserved	R	0h	RESERVED.
16	STEP16	R/W	0h	Enable step 16
15	STEP15	R/W	0h	Enable step 15
14	STEP14	R/W	0h	Enable step 14
13	STEP13	R/W	0h	Enable step 13
12	STEP12	R/W	0h	Enable step 12
11	STEP11	R/W	0h	Enable step 11
10	STEP10	R/W	0h	Enable step 10
9	STEP9	R/W	0h	Enable step 9
8	STEP8	R/W	0h	Enable step 8
7	STEP7	R/W	0h	Enable step 7
6	STEP6	R/W	0h	Enable step 6
5	STEP5	R/W	0h	Enable step 5
4	STEP4	R/W	0h	Enable step 4
3	STEP3	R/W	0h	Enable step 3
2	STEP2	R/W	0h	Enable step 2
1	STEP1	R/W	0h	Enable step 1
0	TS_Charge	R/W	0h	Enable TS Charge step

**12.5.1.16 IDLECONFIG Register (offset = 58h) [reset = 0h]**

 IDLECONFIG is shown in [Figure 12-20](#) and described in [Table 12-20](#).

Idle Step configuration@TSC\_ADC\_SS\_IDLE\_StepConfig Register

**Figure 12-20. IDLECONFIG Register**

## LCD Controller

---

---

This chapter describes the LCD controller of the device.

Topic	Page
<b>13.1 Introduction</b> .....	<b>1098</b>
<b>13.2 Integration</b> .....	<b>1100</b>
<b>13.3 Functional Description</b> .....	<b>1102</b>
<b>13.4 Programming Model</b> .....	<b>1122</b>
<b>13.5 LCD Registers</b> .....	<b>1128</b>

## 13.1 Introduction

### 13.1.1 Purpose of the Peripheral

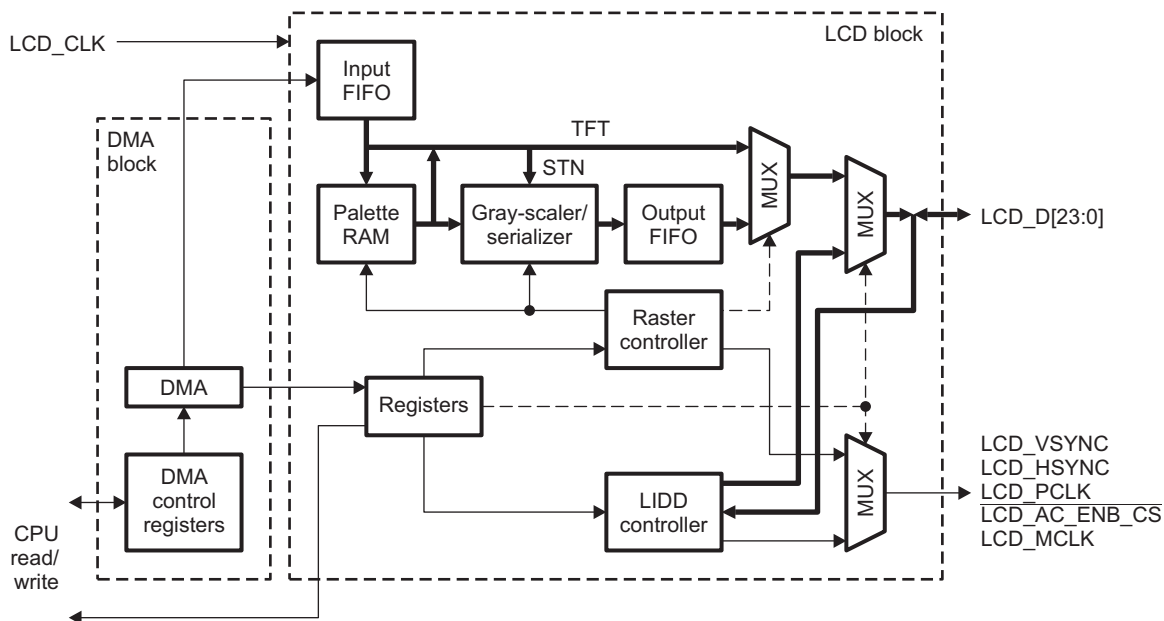

The LCD controller consists of two independent controllers, the Raster Controller and the LCD Interface Display Driver (LIDD) controller. Each controller operates independently from the other and only one of them is active at any given time.

- The Raster Controller handles the synchronous LCD interface. It provides timing and data for constant graphics refresh to a passive display. It supports a wide variety of monochrome and full-color display types and sizes by use of programmable timing controls, a built-in palette, and a gray-scale/serializer. Graphics data is processed and stored in frame buffers. A frame buffer is a contiguous memory block in the system. A built-in DMA engine supplies the graphics data to the Raster engine which, in turn, outputs to the external LCD device.
- The LIDD Controller supports the asynchronous LCD interface. It provides full-timing programmability of control signals (CS, WE, OE, ALE) and output data.

Figure 13-1 shows the LCD controller details. The raster and LIDD Controllers are responsible for generating the correct external timing. The DMA engine provides a constant flow of data from the frame buffer(s) to the external LCD panel via the Raster and LIDD Controllers. In addition, CPU access is provided to read and write registers.

The solid, thick lines in Figure 13-1 indicate the data path. The Raster Controller's data path is fairly complicated, for a thorough description of the Raster Controller data path, see Section 13.3.5.

**Figure 13-1. LCD Controller**

### 13.1.2 Features

General features of the LCD Controller include:

- Supports up to 24-bit data output; 8 bits-per-pixel (RGB).
- Supports up to WXGA (1366x768) resolution.
- Integrated DMA engine to pull data from the external frame buffer without burdening the processor via interrupts or a firmware timer.
- 512 word deep internal FIFO with programmable threshold values.
- Character Based Panels
  - Supports 2 Character Panels (CS0 and CS1) with independent and programmable bus timing parameters when in asynchronous Hitachi, Motorola and Intel modes
  - Supports 1 Character Panel (CS0) with programmable bus timing parameters when in synchronous Motorola and Intel modes
  - Can be used as a generic 16 bit address/data interleaved MPU bus master with no external stall
- Passive Matrix LCD Panels
  - Panel types including STN, DSTN, and C-DSTN
  - AC Bias Control
- Active Matrix LCD Panels
  - Panel types including TN TFT
- OLED Panels
  - Passive Matrix (PM OLED) with frame buffer and controller IC inside the Panel
  - Active Matrix (AM OLED)

### 13.2 Integration

The device includes an LCD Controller that reads display data from external memory and drives several different types of LCD displays. The LCD Controller integration is shown in [Figure 13-2](#).

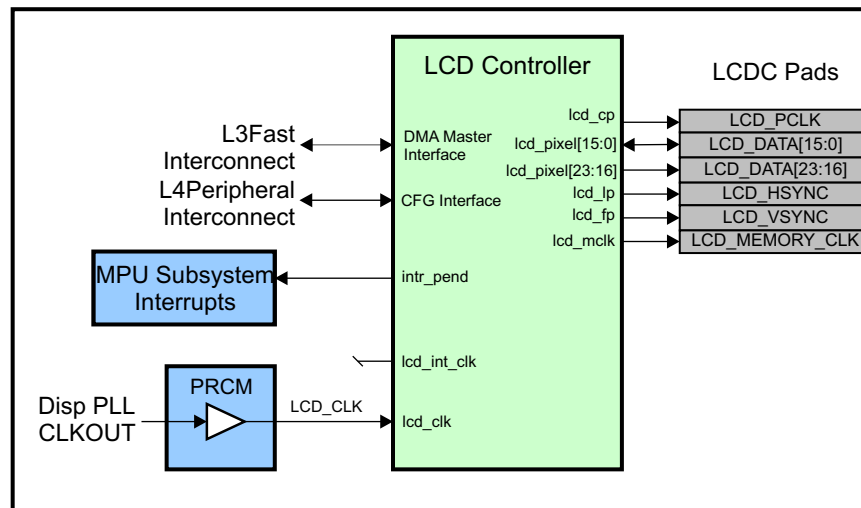

Figure 13-2. LCD Controller Integration

#### 13.2.1 LCD Controller Connectivity Attributes

The general connectivity attributes for the LCDC subsystems are shown in [Table 13-1](#).

Table 13-1. LCD Controller Connectivity Attributes

Attributes	Type
Power Domain	Peripheral Domain
Clock Domain	PD_PER_LCD_L3_GCLK (OCP Master Clock) PD_PER_LCD_L3_GCLK (OCP Slave Clock) PD_PER_LCD_GCLK (Functional Clock)
Reset Signals	PER_DOM_RST_N
Idle/Wakeup Signals	Standby Smart Idle
Interrupt Requests	1 Interrupt to MPU Subsystem (LCDCINT)
DMA Requests	None
Physical Address	L4 Peripheral Slave Port

### 13.2.2 LCD Controller Clock and Reset Management

The LCD module uses the following functional and OCP interface clocks. The L4 Slave interface runs at half the frequency of the L3 Master interface but uses the same clock. The clock is divided within the LCD through the `I4_clkdiv` input using the `pd_per_lcd_l4s_gclk_ien` signal from the PRCM. The functional clock comes from the Display PLL. When the Display PLL is in bypass mode, its output is sourced by either `CORE_CLKOUTM6` or `PER_CLKOUTM2`.

**Table 13-2. LCD Controller Clock Signals**

Clock Signal	Max Freq	Reference / Source	Comments
I3_clk Master Interface Clock	200 MHz	CORE_CLKOUTM4	pd_per_lcd_l3_gclk From PRCM
I4_clk Slave Interface Clock	100 MHz	CORE_CLKOUTM4 (divided within LCD)	pd_per_lcd_l3_gclk From PRCM
lcd_clk Functional Clock	200 MHz	Display PLL CLKOUT	pd_per_lcd_gclk From PRCM

### 13.2.3 LCD Controller Pin List

The LCD Controller external interface signals are shown in [Table 13-3](#).

**Table 13-3. LCD Controller Pin List**

Pin	Type	Description
lcd_cp	O	Pixel Clock in Raster mode Read Strobe or Read/Write Strobe in LIDD mode
lcd_pixel_i[15:0]	I	LCD Data Bus input (for LIDD mode only)
lcd_pixel_o[23:0]	O	LCD Data Bus output
lcd_lp	O	Line Clock or HSYNC in Raster mode; Write Strobe or Direction bit in LIDD mode
lcd_fp	O	Frame Clock or VSYNC in Raster mode; Address Latch Enable in LIDD mode
lcd_ac	O	AC bias or Latch Enable in Raster mode; Primary Chip Select/Primary Enable in LIDD MPU/Hitachi mode
lcd_mclk	O	N/A in Raster mode; Memory Clock/Secondary chip Select/Secondary Enable in LIDD Synchronous/Async MPU/Hitachi mode

## 13.3 Functional Description

### 13.3.1 Clocking

This section details the various clocks and signals. [Figure 13-3](#) shows input and output LCD controller clocks.

**Figure 13-3. Input and Output Clocks**

#### 13.3.1.1 Pixel Clock (LCD\_PCLK)

The pixel clock (LCD\_PCLK) frequency is derived from LCD\_CLK, the reference clock to this LCD module (see [Figure 13-3](#)). The pixel clock is used by the LCD display to clock the pixel data into the line shift register.

$$\text{LCD\_PCLK} = \frac{\text{LCD\_CLK}}{\text{CLKDIV}}$$

where CLKDIV is a field in the LCD\_CTRL register and should not be 0 or 1.

- **Passive (STN) mode.** LCD\_PCLK only transitions when valid data is available for output. It does not transition when the horizontal clock (HSYNC) is asserted or during wait state insertion.
- **Active (TFT) mode.** LCD\_PCLK continuously toggles as long as the Raster Controller is enabled.

### 13.3.1.2 Horizontal Clock (LCD\_HSYNC)

LCD\_HSYNC toggles after all pixels in a horizontal line have been transmitted to the LCD and a programmable number of pixel clock wait states has elapsed both at the beginning and end of each line.

The RASTER\_TIMING\_0 register fully defines the behavior of this signal.

LCD\_HSYNC can be programmed to be synchronized with the rising or falling edge of LCD\_PCLK. The configuration field is bits 24 and 25 in the RASTER\_TIMING\_2 register.

**Active (TFT) mode:** The horizontal clock or the line clock is also used by TFT displays as the horizontal synchronization signal (LCD\_HSYNC).

The timings of the horizontal clock (line clock) pins are programmable to support:

- Delay insertion both at the beginning and end of each line.
- Line clock polarity.
- Line clock pulse width, driven on rising or falling edge of pixel clock.

### 13.3.1.3 Vertical Clock (LCD\_VSYNC)

LCD\_VSYNC toggles after all lines in a frame have been transmitted to the LCD and a programmable number of line clock cycles has elapsed both at the beginning and end of each frame.

The RASTER\_TIMING\_1 register fully defines the behavior of this signal.

LCD\_VSYNC can be programmed to be synchronized with the rising or falling edge of LCD\_PCLK. The configuration field is bits 24 and 25 in the RASTER\_TIMING\_2 register.

- **Passive (STN) mode.** The vertical, or frame, clock toggles during the first line of the screen.
- **Active (TFT) mode.** The vertical, or frame, clock is also used by TFT displays as the vertical synchronization signal (LCD\_VSYNC).

The timings of the vertical clock pins are programmable to support:

- Delay insertion both at the beginning and end of each frame
- Frame clock polarity

### 13.3.1.4 LCD\_AC\_BIAS\_EN

- **Passive (STN) mode.** To prevent a dc charge within the screen pixels, the power and ground supplies of the display are periodically switched. The Raster Controller signals the LCD to switch the polarity by toggling this pin (LCD\_AC\_BIAS\_EN).
- **Active (TFT) mode.** This signal acts as an output enable (OE) signal. It is used to signal the external LCD that the data is valid on the data bus (LCD\_DATA).

### 13.3.2 LCD External I/O Signals

Table 13-4 shows the details of the LCD controller external signals.

**Table 13-4. LCD External I/O Signals**

Signal	Type	Description
LCD_VSYNC	OUT	<p>Raster controller: Frame clock the LCD uses to signal the start of a new frame of pixels. Also used by TFT displays as the vertical synchronization signal.</p> <p>LIDD character: Register select (RS) or address latch enable (ALE)</p> <p>LIDD graphics: Address bit 0 (A0) or command/data select (C/D)</p>
LCD_HSYNC	OUT	<p>Raster controller: Line clock the LCD uses to signal the end of a line of pixels that transfers line data from the shift register to the screen and to increment the line pointer(s). Also used by TFT displays as the horizontal synchronization signal.</p> <p>LIDD character: not used.</p> <p>LIDD graphics:</p> <ul style="list-style-type: none"> <li>• 6800 mode = read or write enable</li> <li>• 8080 mode = not write strobe</li> </ul>
LCD_PCLK	OUT	<p>Raster controller: Pixel clock the LCD uses to clock the pixel data into the line shift register. In passive mode, the pixel clock transitions only when valid data is available on the data lines. In active mode, the pixel clock transitions continuously, and the ac-bias pin is used as an output enable to signal when data is available on the LCD pin.</p> <p>LIDD character: not used.</p> <p>LIDD graphics:</p> <ul style="list-style-type: none"> <li>• 6800 mode = enable strobe</li> <li>• 8080 mode = not read strobe</li> </ul>
LCD_AC_BIAS_EN	OUT	<p>Raster controller: ac-bias used to signal the LCD to switch the polarity of the power supplies to the row and column axis of the screen to counteract DC offset. Used in TFT mode as the output enable to signal when data is latched from the data pins using the pixel clock.</p> <p>LIDD character: Primary enable strobe</p> <p>LIDD graphics: Chip select 0 (CS0)</p>
LCD_MCLK	OUT	<p>Raster controller: not used.</p> <p>LIDD character: Secondary enable strobe</p> <p>LIDD graphics: Chip select 1 (CS1)</p>
LCD_D[23:0]	Raster: OUT	<p>LCD data bus, providing a 4-, 8-, 16- or 24-bit data path.</p> <p>Raster controller: For monochrome displays, each signal represents a pixel; for passive color displays, groupings of three signals represent one pixel (red, green, and blue). LCD_DATA[3:0] is used for monochrome displays of 2, 4, and 8 BPP; LCD_DATA[7:0] is used for color STN displays and LCD_DATA[15:0] or LCD_DATA[23:0] is used for active (TFT) mode.</p>
	LIDD: OUT/IN	<p>LIDD character: LCD_DATA[15:0] Read and write the command and data registers.</p> <p>LIDD graphics: LCD_DATA[15:0] Read and write the command and data registers.</p>

### 13.3.3 DMA Engine

The DMA engine provides the capability to output graphics data to constantly refresh LCDs, without burdening the CPU, via interrupts or a firmware timer. It operates on one or two frame buffers, which are set up during initialization. Using two frame buffers (ping-pong buffers) enables the simultaneous operation of outputting the current video frame to the external display and updating the next video frame. The ping-pong buffering approach is preferred in most applications.

When the Raster Controller is used, the DMA engine reads data from a frame buffer and writes it to the input FIFO (as shown in [Figure 13-1](#)). The Raster Controller requests data from the FIFO for frame refresh; as a result, the DMA's job is to ensure that the FIFO is always kept full.

When the LIDD Controller is used, the DMA engine accesses the LIDD Controller's address and/or data registers.

To program the DMA engine, configure the following registers, as shown in [Table 13-5](#).

**Table 13-5. Register Configuration for DMA Engine Programming**

Register	Configuration
LCDDMA_CTRL	Configure DMA data format
LCDDMA_FB0_BASE	Configure frame buffer 0
LCDDMA_FB0_CEILING	
LCDDMA_FB1_BASE	Configure frame buffer 1. (If only one frame buffer is used, these two registers will not be used.)
LCDDMA_FB1_CEILING	

In addition, the LIDD\_CTRL register (for LIDD Controller) or the RASTER\_CTRL register (for Raster Controller) should also be configured appropriately, along with all the timing registers.

To enable DMA transfers, the LIDD\_DMA\_EN bit (in the LIDD\_CTRL register) or the LCDEN bit (in the RASTER\_CTRL register) should be written with 1.

#### 13.3.3.1 Interrupts

Interrupts in this LCD module are related to DMA engine operation. Four registers are used to control and monitor the interrupts:

- The IRQENABLE\_SET register allows the user to enable any of the interrupt sources.
- The IRQENABLE\_CLEAR register allows the user to disable interrupt sources.
- The IRQSTATUS\_RAW register collects all the interrupt status information.
- The IRQSTATUS register collects the interrupt status information for all enabled interrupts. Any interrupt source not enabled in the IRQENABLE\_SET register is masked out.

##### 13.3.3.1.1 LIDD Mode

When operating in LIDD mode, the DMA engine generates one interrupt signal every time the specified frame buffer has been transferred completely.

- The DONE bit in the LIDD\_CTRL register specifies if the interrupt signal is delivered to the system interrupt controller, which in turn may or may not generate an interrupt to CPU.
- The EOF1, EOF0, and DONE bits in the IRQSTATUS\_RAW register reflect the interrupt signal, regardless of being delivered to the system interrupt controller or not.

##### 13.3.3.1.2 Raster Mode

When operating in Raster mode, the DMA engine can generate the interrupts in the following scenarios:

1. **Output FIFO under-run.** This occurs when the DMA engine cannot keep up with the data rate consumed by the LCD (which is determined by the LCD\_PCLK.) This is likely due to a system memory throughput issue or an incorrect LCD\_PCLK setting. The FUF bit in IRQSTATUS\_RAW is set when this error occurs. This bit is cleared by writing a 1 to the FUF bit in the IRQSTATUS register.

2. **Frame synchronization lost.** This error happens when the DMA engine attempts to read what it believes to be the first word of the video buffer but it cannot be recognized as such. This could be caused by an invalid frame buffer address or an invalid BPP value (for more details, see [Section 13.3.5.2](#)). The SYNC bit in the IRQSTATUS\_RAW register is set when such an error is detected. This bit is cleared by writing a 1 to the SYNC bit in the IRQSTATUS register.
3. **Palette loaded.** When using palette-only or palette+data modes, the PL bit in the IRQSTATUS\_RAW register will be set when the palette portion of a DMA transfer has been loaded into palette RAM. This interrupt can be cleared by writing a '1' to the PL bit in the IRQSTATUS register.
4. **AC bias transition.** If the ACB\_I bit in the RASTER\_TIMING\_2 register is programmed with a non-zero value, an internal counter will be loaded with this value and starts to decrement each time LCD\_AC\_BIAS\_EN (AC-bias signal) switches its state. When the counter reaches zero, the ACB bit in the IRQSTATUS\_RAW register is set, which will deliver an interrupt signal to the system interrupt controller (if the interrupt is enabled.) The counter reloads the value in field ACB\_I, but does not start to decrement until the ACB bit is cleared by writing 1 to this bit in the IRQSTATUS register.
5. **Frame transfer completed.** When one frame of data is transferred completely, the DONE bit in the IRQSTATUS\_RAW register is set. Note that the EOF0 and EOF1 bits in the IRQSTATUS\_RAW register will be set accordingly. This bit is cleared by writing a 1 to the corresponding interrupt in the IRQSTATUS register.

Note that the interrupt enable bits are in the IRQENABLE\_SET register. The corresponding enable bit must be set in order to generate an interrupt to the CPU. However, the IRQSTATUS\_RAW register reflects the interrupt signal regardless of the interrupt enable bits settings.

### 13.3.3.1.3 Interrupt Handling

See [Chapter 6, Interrupts](#), for information about LCD interrupt number to CPU. The interrupt service routine needs to determine the interrupt source by examining the IRQSTATUS\_RAW register and clearing the interrupt properly.

## 13.3.4 LIDD Controller

The LIDD Controller is designed to support LCD panels with a memory-mapped interface. The types of displays range from low-end character monochrome LCD panels to high-end TFT smart LCD panels.

LIDD mode (and the use of this logic) is enabled by clearing the MODESEL bit in the LCD control register (LCD\_CTRL).

LIDD Controller operation is summarized as follows:

- During initialization, the LCD LIDD CS0/CS1 configuration registers (LIDD\_CS0\_CONF and LIDD\_CS1\_CONF) are configured to match the requirements of the LCD panel being used.
- During normal operation, the CPU writes display data to the LCD data registers (LIDD\_CS0\_DATA and LIDD\_CS1\_DATA). The LIDD interface converts the CPU write into the proper signal transition sequence for the display, as programmed earlier. Note that the first CPU write should send the beginning address of the update to the LCD panel and the subsequent writes update data at display locations starting from the first address and continuing sequentially. Note that DMA may be used instead of CPU.
- The LIDD Controller is also capable of reading back status or data from the LCD panel, if the latter has this capability. This is set up and activated in a similar manner to the write function described above.

---

**NOTE:** If an LCD panel is not used, this interface can be used to control any MCU-like peripheral.

---

See your device-specific data manual to check the LIDD features supported by the LCD controller.

[Table 13-6](#) describes how the signals are used to interface external LCD modules, which are configured by the LIDD\_CTRL register.

**Table 13-6. LIDD I/O Name Map**

Display Type	Interface Type	Data Bits	LIDD_CTRL [2:0]	I/O Name	Display I/O Name	Comment
Character Display	HD44780 Type	4	100	LCD_DATA[7:4]	DATA[7:4]	Data Bus (length defined by Instruction)
				$\overline{\text{LCD\_AC\_BIAS\_EN}}$	E (or E0)	Enable Strobe (first display)
				LCD_HSYNC	R/ $\overline{\text{W}}$	Read/ $\overline{\text{Write}}$
				LCD_VSYNC	RS	Register Select (Data/not Instruction)
				LCD_MCLK	E1	Enable Strobe (second display optional)
Character Display	HD44780 Type	8	100	LCD_DATA[7:0]	DATA[7:0]	Data Bus (length defined by Instruction)
				$\overline{\text{LCD\_AC\_BIAS\_EN}}$	E (or E0)	Enable Strobe (first display)
				LCD_HSYNC	R/ $\overline{\text{W}}$	Read/ $\overline{\text{Write}}$
				LCD_VSYNC	RS	Register Select (Data/not Instruction)
				LCD_MCLK	E1	Enable Strobe (second display optional)
Micro Interface Graphic Display	6800 Family	Up to 16	001	LCD_DATA[15:0]	DATA[7:0]	Data Bus (16 bits always available)
				LCD_PCLK	E	Enable Clock
				LCD_HSYNC	R/ $\overline{\text{W}}$	Read/ $\overline{\text{Write}}$
				LCD_VSYNC	A0	Address/Data Select
				$\overline{\text{LCD\_AC\_BIAS\_EN}}$	CS (or CS0)	Chip Select (first display)
				LCD_MCLK	CS1	Chip Select (second display optional)
				000	LCD_MCLK	None
Micro Interface Graphic Display	8080 Family	Up to 16	011	LCD_DATA[15:0]	DATA[7:0]	Data Bus (16 bits always available)
				LCD_PCLK	RD	Read Strobe
				LCD_HSYNC	WR	Write Strobe
				LCD_VSYNC	A0	Address/Data Select
				$\overline{\text{LCD\_AC\_BIAS\_EN}}$	CS (or CS0)	Chip Select (first display)
				LCD_MCLK	CS1	Chip Select (second display optional)
				010	LCD_MCLK	None

The timing parameters are defined by the LIDD\_CS0\_CONF and LIDD\_CS1\_CONF registers, which are described in [Section 13.5.4](#) and [Section 13.5.7](#).

The timing configuration is based on an internal reference clock, MCLK. The MCLK is generated out of LCD\_CLK, which is determined by the CLKDIV bit in the LCD\_CTRL register.

$$\text{MCLK} = \text{LCD\_CLK} \text{ when } \text{CLKDIV} = 0.$$

$$\text{MCLK} = \frac{\text{LCD\_CLK}}{\text{CLKDIV}} \text{ when } \text{CLKDIV} \neq 0.$$

See your device-specific data manual for the timing configurations supported by the LCD controller.

### 13.3.5 Raster Controller

Raster mode (and the use of this logic) is enabled by setting the MODESEL bit in the LCD control register (LCD\_CTRL). Table 13-7 shows the active external signals when this mode is active.

**Table 13-7. Operation Modes Supported by Raster Controller**

Interface	Data Bus Width	Register Bits RASTER_CTRL[9, 7, 1]	Signal Name	Description
Passive (STN) Mono 4-bit	4	001	LCD_DATA[3:0]	Data bus
			LCD_PCLK	Pixel clock
			LCD_HSYNC	Horizontal clock(Line Clock)
			LCD_VSYNC	Vertical clock (Frame Clock)
			LCD_AC_BIAS_EN	AC Bias
			LCD_MCLK	Not used
Passive (STN) Mono 8-bit	8	101	LCD_DATA[7:0]	Data bus
			LCD_PCLK	Pixel clock
			LCD_HSYNC	Horizontal clock(Line Clock)
			LCD_VSYNC	Vertical clock (Frame Clock)
			LCD_AC_BIAS_EN	AC Bias
			LCD_MCLK	Not used
Passive (STN) Color	8	100	LCD_DATA[7:0]	Data bus
			LCD_PCLK	Pixel clock
			LCD_HSYNC	Horizontal clock(Line Clock)
			LCD_VSYNC	Vertical clock (Frame Clock)
			LCD_AC_BIAS_EN	AC Bias
			LCD_MCLK	Not used
Active (TFT) Color	16	x10	LCD_DATA[15:0]	Data bus
			LCD_PCLK	Pixel clock
			LCD_HSYNC	Horizontal clock(Line Clock)
			LCD_VSYNC	Vertical clock (Frame Clock)
			LCD_AC_BIAS_EN	Output enable
			LCD_MCLK	Not used

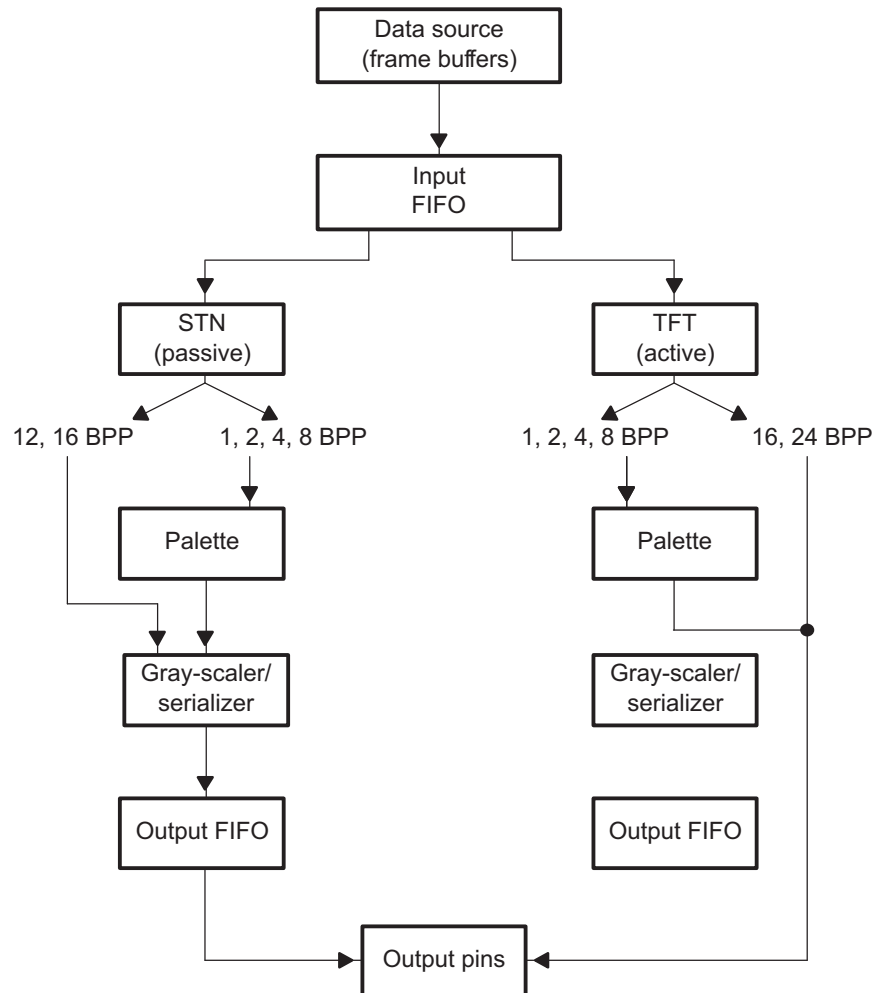

### 13.3.5.1 Logical Data Path

The block diagram of the Raster Controller is shown in [Figure 13-1](#). [Figure 13-4](#) illustrates its logical data path for various operation modes (passive (STN) versus active (TFT), various BPP size).

[Figure 13-4](#) shows that:

- The gray-scaler/serializer and output FIFO blocks are bypassed in active (TFT) modes.
- The palette is bypassed in both 12- and 16-BPP modes.

**Figure 13-4. Logical Data Path for Raster Controller**

In summary:

- The display image is stored in frame buffers.
- The built-in DMA engine constantly transfers the data stored in the frame buffers to the Input FIFO.
- The Raster Controller relays data to the external pins according to the specified format.

The remainder of this section describes the functioning blocks in [Figure 13-4](#), including frame buffers, palette, and gray-scaler/serializer. Their operation and programming techniques are covered in detail. The output format is also described in [Section 13.3.5.5](#).

### 13.3.5.2 Frame Buffer

A frame buffer is a contiguous memory block, storing enough data to fill a full LCD screen. For this device, external memory needs to be used for the frame buffer. For specific details on which external memory interface (EMIF) controller can be accessed by the LCD controller, see your device-specific data manual. The data in the frame buffer consists of pixel values as well as a look-up palette. [Figure 13-5](#) shows the frame buffer structure.

**Figure 13-5. Frame Buffer Structure**

#### 1, 2, 4, 12, 16, 24 BPP Modes

#### 8 BPP Mode

**NOTE:**

- 8-BPP mode uses the first 512 bytes in the frame buffer as the palette while the other modes use 32 bytes.
- 12-, 16-, and 24-BPP modes do not need a palette; i.e., the pixel data is the desired RGB value. However, the first 32 bytes are still considered a palette. The first entry should be 4000h (bit 14 is 1) while the remaining entries must be filled with 0. (For details, see [Table 13-8](#).)
- Each entry in a palette occupies 2 bytes. As a result, 8-BPP mode palette has 256 color entries while the other palettes have up to 16 color entries.
- 4-BPP mode uses up the all the 16 entries in a palette.
- 1-BPP mode uses the first 2 entries in a palette while 2-BPP mode uses the first 4 entries. The remaining entries are not used and must be filled with 0.
- In 12- and 16-BPP modes, pixel data is RGB data. For all the other modes, pixel data is actually an index of the palette entry.

**Table 13-8. Bits-Per-Pixel Encoding for Palette Entry 0 Buffer**

Bit	Name	Value	Description <sup>(1)</sup> <sup>(2)</sup> <sup>(3)</sup>
14-12	BPP		Bits-per-pixel.
		000	1 BPP
		001	2 BPP
		010	4 BPP
		011	8 BPP
		1xx	12 BPP in passive mode (TFT_STN = 0 and STN_565 = 0 in RASTER_CTRL) 16 BPP in passive mode (TFT_STN = 0 and STN_565 = 1 in RASTER_CTRL) 16 BPP in active mode (LCDTFT = 1 and TFT24 = 0 in RASTER_CTRL) 24 BPP in active mode (LCDTFT = 1 and TFT24 = 1 in RASTER_CTRL)

<sup>(1)</sup> Eight 1-bit pixels, four 2-bit pixels, and two 4-bit pixels are packed into each byte, and 12-bit pixels are right justified on (16-bit) word boundaries (in the same format as palette entry).

<sup>(2)</sup> For STN565, see the 16 BPP STN mode bit ([Section 13.5.10](#)).

<sup>(3)</sup> For Raw Data (12/16/24 bpp) framebuffer, no Palette lookup is employed therefore PALMODE = 0x10 in RASTER\_CTRL.

The equations shown in [Table 13-9](#) are used to calculate the total frame buffer size (in bytes) based on varying pixel size encoding and screen sizes.

[Figure 13-6](#) and [Figure 13-7](#) show more detail of the palette entry organization.

**Table 13-9. Frame Buffer Size According to BPP**

BPP	Frame Buffer Size
1	$32 + (\text{Lines} \times \text{Columns})/8$
2	$32 + (\text{Lines} \times \text{Columns})/4$
4	$32 + (\text{Lines} \times \text{Columns})/2$
8	$512 + (\text{Lines} \times \text{Columns})$
12/16	$32 + 2 \times (\text{Lines} \times \text{Columns})$

**Figure 13-6. 16-Entry Palette/Buffer Format (1, 2, 4, 12, 16 BPP)**

A. Bits-per-pixels (BPP) is only contained within the first palette entry (palette entry 0).

**Figure 13-7. 256-Entry Palette/Buffer Format (8 BPP)**

A. Bits-per-pixels (BPP) is only contained within the first palette entry (palette entry 0).

Bits 12, 13, and 14 of the first palette entry select the number of bits-per-pixel to be used in the following frame and thus the number of palette RAM entries. The palette entry is used by the Raster Controller to correctly unpack pixel data.

Figure 13-8 through Figure 13-13 show the memory organization within the frame buffer for each pixel encoding size.

**Figure 13-8. 16-BPP Data Memory Organization (TFT Mode Only)—Little Endian**

**Figure 13-9. 12-BPP Data Memory Organization—Little Endian**

Unused [15-12] bits are filled with zeroes in TFT mode.

**Figure 13-10. 8-BPP Data Memory Organization**

**Figure 13-11. 4-BPP Data Memory Organization**

**Figure 13-12. 2-BPP Data Memory Organization**

Bit	7	6	5	4	3	2	1	0
Base	Pixel 0	Pixel 1	Pixel 2	Pixel 3	Pixel 4	Pixel 5	Pixel 6	Pixel 7
Base + 1	Pixel 8	Pixel 9	Pixel 10	Pixel 11	Pixel 12	Pixel 13	Pixel 14	Pixel 15
Base + 2	Pixel 16	Pixel 17	Pixel 18	Pixel 19	Pixel 20	Pixel 21	Pixel 22	Pixel 23

**Figure 13-13. 1-BPP Data Memory Organization**

Bit	7	6	5	4	3	2	1	0
Base	P0	P1	P2	P3	P4	P5	P6	P7
Base + 1	P8	P9	P10	P11	P12	P13	P14	P15

### 13.3.5.3 Palette

As explained in the previous section, the pixel data is an index of palette entry (when palette is used). The number of colors supported is given by  $2^{\text{number of BPP}}$ . However, due to a limitation of the gray-scaler/serializer block, fewer grayscales or colors may be supported.

The PLM field (in RASTER\_CTRL) affects the palette loading:

- If PLM is 00b (palette-plus-data mode) or 01b (palette-only mode), the palette is loaded by the DMA engine at the very beginning, which is followed by the loading of pixel data.
- If PLM is 10b (data-only mode), the palette is not loaded. Instead, the DMA engine loads the pixel data immediately.

### 13.3.5.4 Gray-Scaler/Serializer

#### 13.3.5.4.1 Passive (STN) Mode

Once a palette entry is selected from the look-up palette by the pixel data, its content is sent to the gray-scaler/serializer. If it is monochrome data, it is encoded as 4 bits. If it is color data, it is encoded as 4 bits (Red), 4 bits (Green), and 4 bits (Blue).

These 4-bit values are used to select one of the 16 intensity levels, as shown in [Table 13-10](#). A patented algorithm is used during this processing to provide an optimized intensity value that matches the eye's visual perception of color/gray gradations.

#### 13.3.5.4.2 Active (TFT) Mode

The gray-scaler/serializer is bypassed.

**Table 13-10. Color/Grayscale Intensities and Modulation Rates**

Dither Value (4-Bit Value from Palette)	Intensity (0% is White)	Modulation Rate (Ratio of ON to ON+OFF Pixels)
0000	0.0%	0
0001	14.3%	1/7
0010	20.0%	1/5
0011	25%	1/4
0100	33.3%	3/9
0101	40.0%	2/5
0110	44.4%	4/9
0111	50.0%	1/2
1000	55.6%	5/9
1001	60.0%	3/5
1010	66.6%	6/9
1011	75%	3/4
1100	80.0%	4/5
1101	85.7%	6/7
1110	93.3%	14/15
1111	100.0%	1

### 13.3.5.4.3 Summary of Color Depth

**Table 13-11. Number of Colors/Shades of Gray Available on Screen**

Number of BPP	Passive Mode (LCDTFT = 0)		Active Mode (LCDTFT = 1)
	Monochrome (LCDBW = 1)	Color (LCDBW = 0)	Color Only (LCDBW = 0)
1	2 palette entries to select within 15 grayscales	2 palette entries to select within 3375 possible colors	2 palette entries to select within 4096 possible colors
2	4 palette entries to select within 15 grayscales	4 palette entries to select within 3375 possible colors	4 palette entries to select within 4096 possible colors
4	16 palette entries to select within 15 grayscales	16 palette entries to select within 3375 possible colors	16 palette entries to select within 4096 possible colors
8	Not relevant since it would consist in 256 palette entries to select within 15 grayscales, but exists anyway	256 palette entries to select 3375 possible colors	256 palette entries to select within 4096 possible colors
12	x	3375 possible colors	4096 possible colors
16	x	3375 possible colors (STN_565 = 1)	Up to 65536 possible colors
24	X	X	Up to 16.7 million colors

### 13.3.5.5 Output Format

#### 13.3.5.5.1 Passive (STN) Mode

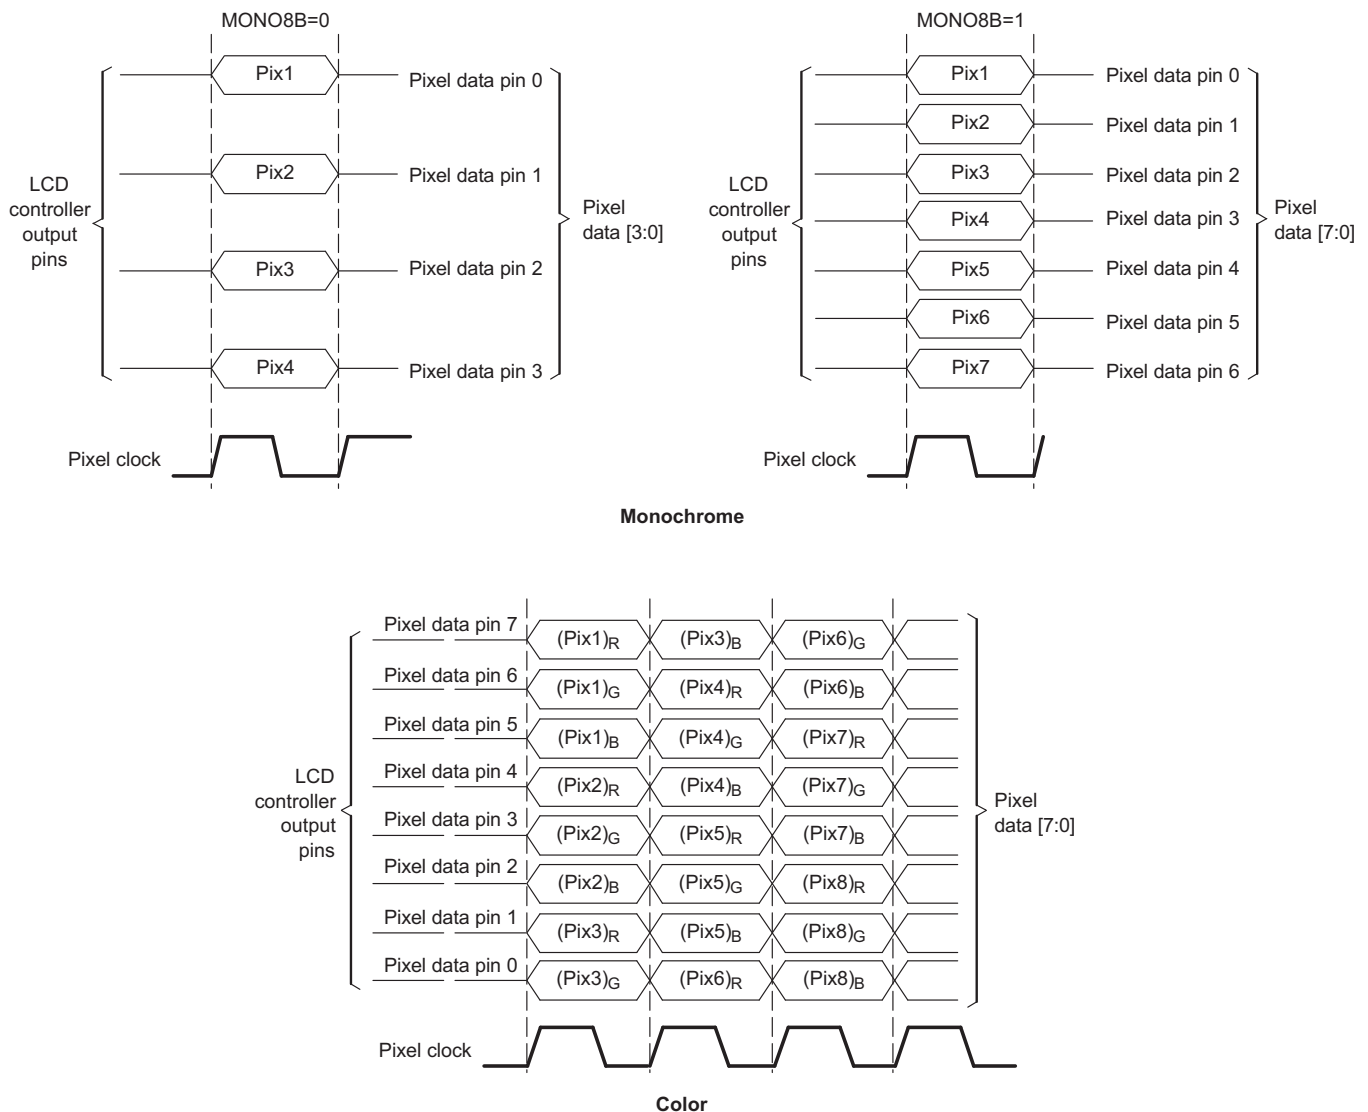

As shown in Figure 13-4, the pixel data stored in frame buffers go through palette (if applicable) and gray-scaler/serializer before reaching the Output FIFO. As a result, it is likely that the data fed to the Output FIFO is numerically different from the data in the frame buffers. (However, they represent the same color or grayscale.)

The output FIFO formats the received data according to display modes (see Table 13-7). Figure 13-14 shows the actual data output on the external pins.

#### 13.3.5.5.2 Active (TFT) Mode

As shown in Figure 13-4, the gray-scaler/serializer and output FIFO are bypassed in active (TFT) mode. Namely, at each pixel clock, one pixel data (16 bits) is output to the external LCD.

**Figure 13-14. Monochrome and Color Output**

### 13.3.5.6 Subpicture Feature

A feature exists in the LCD to cover either the top or lower portion of the display with a default color. This feature is called a subpicture and is illustrated in [Figure 13-15](#). Subpictures are only allowed for Active Matrix mode (`cfg_lcdtft = '1'`).

Subpictures reduce the bandwidth to the DDR since lines containing default pixel data are not read from memory. For example, suppose the panel has 100 lines of which 50 are default pixel data lines. Then, only 50 lines of data are DMAed from DDR for this subpicture setup. That is, the `cfg_fbx_base` and `cfg_fbx_ceiling` registers only encompass 50 lines of data instead of 100.

**Figure 13-15. Example of Subpicture**

The subpicture feature is enabled when the `spen` MMR control bit is set to '1'. The `hols` bit, when set to '0', puts the Default Pixel Data lines at the top of the screen and the active video lines at the bottom of the screen.

When the `hols` bit is set to '1', Active video lines are at the top of the screen and Default Pixel Data lines are at the bottom of the screen. The `hols` bit behavior is shown in [Figure 13-16](#).

**Figure 13-16. Subpicture HOLS Bit**

The lines per panel threshold (LPPT) bitfield defines the number of lines at the bottom of the picture for both `hols = '1'` or `'0'`. LPPT is an encoded value in the range {0:2047} used to represent the number of lines in the range {1:2048}.

Figure 13-17. Raster Mode Display Format

### 13.3.6 Interrupt Conditions

#### 13.3.6.1 Highlander 0.8 Interrupts

##### 13.3.6.1.1 Highlander Interrupt Basics

The interrupt mechanism is Highlander 0.8-compliant and relies on the ipgvmidirq IP Generic. The ipgvmidirq module supports hardware-initiated interrupts, each of which can also be individually triggered by software. An interrupt mask function allows each interrupt to be masked or enabled. The software can read all of the raw interrupts or only those that are unmasked.

All pending interrupts in the LCD module must be serviced by the Host's Interrupt Service Routine before it exits.

The Interrupt Module registers are described in the following table.

**Table 13-12. Highlander 0.8 Interrupt Module Control Registers**

Address Offset	Name	Description
0x58	Reg22	Interrupt Raw Status Register
0x5C	Reg23	Interrupt Masked Status Register
0x60	Reg24	Interrupt Enable Set (Unmask)
0x64	Reg25	Interrupt Enable Clear (Mask)
0x68	Reg26	End of Interrupt Indicator

##### 13.3.6.1.2 Raw Status Register

Interrupts are associated with a bit position. For instance, Hardware Interrupt 0 is physically connected to bit 0 of the interrupt controller and all Sets, Clears, and Masks to this interrupt will reference the Bit 0 location of the interrupt vector. Likewise, Hardware Interrupt 1 is referenced by bit 1 of the interrupt vector, and so on.

The Host CPU can see all the interrupts that have been set, regardless of the interrupt mask, by reading Reg22, the Raw Status Register.

If the Host CPU writes a '1' to a bit position in Reg 22, it will do a software set for the interrupt associated with that bit position.

##### 13.3.6.1.3 Masked Status Register

The Masked Status Register contains all the pending interrupts that are unmasked (enabled). The Interrupt Service Routine should read this register to determine which interrupts must be serviced.

##### 13.3.6.1.4 Interrupt Enable Set Register

To unmask an interrupt, the Host CPU writes a '1' to the appropriate bit position of the Enable Set (Unmask) register.

##### 13.3.6.1.5 Interrupt Enable Clear Register

To mask an interrupt, the Host CPU writes a '1' to the appropriate bit position of the Enable Clear (Mask) register.

##### 13.3.6.1.6 End of Interrupt Register

The ipgvmidirq module supports level or pulse interrupts to the CPU. For pulse interrupts, the Host must write to an end-of-interrupt (EOI), memory-mapped address to indicate that the Interrupt Service Routine has completed and is exiting. Any pending interrupts that have not been serviced will trigger another interrupt pulse to the Host CPU.

## 13.3.6.2 Interrupt Sources

### 13.3.6.2.1 Overview of Interrupt Sources

The interrupt sources include:

- DMA End of Frame 0
- DMA End of Frame 1
- Palette Loaded
- FIFO Underflow
- AC Bias Count
- Sync Lost
- Recurrent Frame Done
- LIDD or Raster Frame Done

#### 13.3.6.2.1.1 DMA End of Frame 0 and End of Frame 1 Interrupt

The DMA End of Frame 0 and End of Frame 1 interrupts are triggered when the DMA module has completed transferring the contents of a frame buffer bounded by `cfg_fb0_base/cfg_bf0_ceil` or `cfg_fb1_base/cfg_fb1_ceil`.

#### 13.3.6.2.1.2 Palette Loaded Interrupt

When `cfg_palmode` is set to Palette-only or Palette+data, the Palette Loaded interrupt is triggered when the palette portion of the DMA transfer has been stored in the Palette RAM.

#### 13.3.6.2.1.3 FIFO Underflow Interrupt

The FIFO Underflow interrupt is triggered when the real-time output needs to send a value for pixel data but one cannot be found in the FIFO.

#### 13.3.6.2.1.4 AC Bias Count Interrupt

For Passive Matrix displays, a count can be kept of the number of times the AC Bias line toggles. Once the specified number of transitions has been seen, the AC Bias Count interrupt is triggered. The module will not post any further interrupts or keep counting AC Bias transitions until the interrupt has been cleared.

#### 13.3.6.2.1.5 Sync Lost Interrupt

When the DMA module reads a frame buffer and stores it in the FIFO, it sets a start frame and an end frame indicator embedded with the data. On retrieving the data from the FIFO in the `lcd_clk` domain, the Sync Lost interrupt is triggered if the start indicator is not found at the first pixel of a new frame.

#### 13.3.6.2.1.6 Recurrent Frame Done Interrupt

In raster mode, the Recurrent Frame Done interrupt is triggered each time a complete frame has been sent to the interface pins.

#### 13.3.6.2.1.7 LIDD or Raster Frame Done Interrupt

In LIDD DMA mode, a frame buffer of data is sent. When the frame buffer has completed, the LIDD Frame Done interrupt is triggered. In order to do another LIDD DMA, the DMA engine must be disabled and then re-enabled.

In Raster mode, the interrupt is triggered after `cfg_lcden` is set to '0' and after the last frame is sent to the pins. After the Raster mode DMA is running, the interrupt occurs only once after the module is disabled.

### 13.3.7 DMA

DDR access is handled internally by the DMA module. For Character Displays, the DMA module can transfer a sequence of data transactions from the DDR to LCD panel. By using the DMA instead of the Host CPU, the Host will not be stalled waiting for the slow external peripheral to complete.

For Passive and Active Matrix displays, the DMA is used to read frame buffers with associated palette information from DDR. The DMA parses the frame buffer according to the frame buffer type and supplies the raster processing chain with Palette information and pixel data as needed.

### 13.3.8 Power Management

Power management within the DSS can be accomplished in several ways:

1. L4 OCP MConnect/SConnect can disable the internal L4 clock network.
2. L3 OCP MConnect/Sconnect can disable the internal L3 clock network.
3. Within the Clock Control register, there are clock enable registers to disable the clock networks to all major internal functional paths.
4. Power Compiler clock gates are automatically instantiated within datapaths to minimize active power.

Items 1 and 2 are accomplished using the standard IDLE (for L4) and STANDBY (for L3) IPGeneric modules. When these modules are instructed to disable clocks for the internal L3 or L4 (MMR) clock domains, the internal clock networks will be shut down. This shutdown applies to the external clock pins I3\_clk and I4\_clk.

All other internal clock domains (Item 3) can only be shut down by writing the appropriate register bit within the Clock Enable register. This software clock control applies to all other clock inputs.

Power Compiler clock gating is done automatically as a function of the design. There is no special control required for this operation.

Because the LCD normally drives displays, and because all video is sourced from the L3 clock domain, shutting down the L3 domain using the IPGenerics can cause undesirable display effects. In most circumstances, it will be necessary to hardware/software reset the LCD module after such an event has occurred.

## 13.4 Programming Model

### 13.4.1 LCD Character Displays

#### 13.4.1.1 Configuration Registers, Setup, and Settings

##### 13.4.1.1.1 Configuration Registers

Set the following to appropriate values for the target LCD character panel:

- `cfg_cs1_e1_pol`
- `cfg_cs0_e0_pol`
- `ws_dir_pol`
- `cfg_rs_en_pol`
- `cfg_alepol`

`cfg_lidd_mode_sel[2:0]` defines the type of CPU bus that will be used in interfacing with the LCD character panel. Note that the clocked bus styles only support a single panel using CS0 since the clock pin takes a device pin that is otherwise used for CS1.

Set the following to appropriate bus timing parameters for the target LCD character panel:

- `cfg_w_su`
- `cfg_w_strobe`
- `cfg_w_hold`, `cfg_r_su`
- `cfg_r_strobe`
- `cfg_r_hold`
- `cfg_ta`

A set of bus timing parameters are individually available for CS0 and CS1 such that the bus transactions can be customized for each of the two supported LCD character displays.

##### 13.4.1.1.2 Defining Panel Commands and Panel Data

In the Hitachi interface mode used for the example panel, whether the Character Panel understands a data transfer as Command or Data depends on the state of the REGSEL input pin. Writing to the `cfg_adr_indx` register will output a Command transfer. Writing to the `cfg_data` register will result in a Data transfer.

Functionally, the ALE (`lcd_fp` pin) from the LCD controller is tied to the REGSEL input of the character panel.

For example, to send byte 0xAB as a command to the previously described character panel, the CPU would write 0x00AB to the `adr_indx` register. To send byte 0xAB as data, the CPU would write 0x00AB to the data register.

### 13.4.1.2 CPU Initiated Data Bus Transactions

#### 13.4.1.2.1 Initiating Data Bus Transactions

Writing to `cfg_cs0_data` will initiate a write transfer to the CS0 panel. Reading from `cfg_cs0_data` will initiate a read transfer from the CS0 panel.

Writing to `cfg_cs1_data` will initiate a write transfer to the CS1 panel. Reading from `cfg_cs1_data` will initiate a read transfer from the CS0 panel.

---

**NOTE:** Writes to CS1 translate to valid bus transactions only if `cfg_lidd_mode_sel[2:0]` is configured for an asynchronous mode.

---

### 13.4.1.3 DMA Initiated Data Bus Transactions for LIDD

#### 13.4.1.3.1 DMA Overview for MPU Bus Output

Writing a long sequence of data to the Character Display Panel will ensure that the CPU will be occupied for a long time. However, the DMA module supports a mode in which this sequence of data elements can first be written in DRAM by the CPU.

The DMA can read this sequence of commands or data from the DRAM and send it to the LCD Interface Display Driver (LIDD) module such that each data element becomes a write bus transaction to the external Character Panel/MPU Bus. The data bus write transaction can target either CS0 or CS1 and use the appropriate bus timing parameters.

Functionally, in this DMA LIDD mode, the DMA module sends the sequence of data to the LIDD module by acting as another CPU.

The DMA can only perform write bus transactions. It cannot read from the external character panel a series of data elements and store them in the DRAM.

When the LIDD module is controlled by the DMA module by setting `cfg_lidd_dma_en = '1'`, CPU reads or writes to `cfg_adr_index` and `cfg_data` are not allowed.

The `fb0_base` and `fb0_ceil` registers define the address boundary of data elements to be sent out the character display by the DMA engine. Setting `cfg_lidd_dma_en` from '0' to '1' will initiate the DMA as if a virtual CPU is reading data from the DDR and writing the values to Reg6 or Reg9. `cfg_dma_cs0_cs1` determines whether the virtual CPU writes to Reg6 (CS0) or Reg7 (CS1).

---

**NOTE:** Writes to CS1 translate to valid bus transactions only if `cfg_lidd_mode_sel[2:0]` is configured for an asynchronous mode.

---

The DMA module requires the start and end DDR addresses to be on word-aligned byte addresses. The MPU/LIDD bus is a halfword (16 bit) output, so both the upper and lower halfwords of the DDR memory will be sent out. Thus, the number of data elements sent to the LIDD by the DMA must always result in an even number of bus MPU bus transactions. In other words, a transfer of three 32-bit words from DDR will result in six 16-bit bus transactions.

### 13.4.1.3.2 MCU/LIDD DMA Setup: Example Pseudo Code

Suppose we want to send by DMA a section of DDR memory from byte address 0x4 to byte address 0x3C to the MCU bus using chip select 0. The pseudo code for such an operation is listed below.

```
// Enable Clocks
wr 006C 0000_0007

// LCD Control Register
wr 0004 0000_8000 // set clock divisor

// LIDD Control Register
wr 000C 0000_000C // set output bus polarities and lidd_mode_sel

// LIDD CS0 Register
wr 0010 0822_1044 // set bus timing parameters for CS0

// DMA Control Register
wr 0040 0000_0030 // set DMA parameters like burst size, memory layout

// DMA FB0 Base Register
wr 0044 0000_0004 // DMA start byte address

// DMA FB0 Ceiling Register
wr 0048 0000_003C // DMA end byte address

// LIDD Control Register - enable DMA
wr 000C 0000_010C // Flip LIDD DMA enable bit
```

Once the DMA completes sending data to the Async FIFO, the Eof0 interrupt will occur. The Done interrupt will occur when the last word is written out the MPU bus.

The CPU must bring `cfg_lidd_dma_en` low before the CPU can directly initiate MPU bus transactions or for the DMA module to start again.

### 13.4.1.4 Passive Matrix

#### 13.4.1.4.1 Monochrome Bitrate Awareness

In a mostly testbench related note, care must be taken when configuring the module for Passive Matrix (`cfg_lcdtft = '0'`) monochrome (`cfg_lcdbw = '1'`) modes. In passive matrix mode, the Blue component of the Grayscale output is used as the quantized value for each scan order pixel.

When `cfg_mono8b='1'`, eight pixel values must be sent through the grayscale before one 8-bit output is ready. This output data represents the passive matrix output states for eight pixels.

Likewise, when `cfg_mono8b='0'`, four pixel values must be sent through the grayscale before one 4-bit output is ready. This output data represents the passive matrix output states for four pixels.

The problem arises when the output clock is fast (`cfg_clkdiv=0x2`). The data path must output a value every two system clocks. However, it takes four or eight system clocks to generate a data element to be output. In this case, the LCD module returns an underflow interrupt.

In practice, such a situation does not occur because passive matrix panels are slow by design.

## 13.4.2 Active Matrix Displays

### 13.4.2.1 Interfacing to Dual LVDS Transmitters

The pixel clock rate for HD-sized pictures is approximately 148.5 MHz. At this speed, the LVDS link requires a double-wide data bus for transferring the even and odd pixels at half the pixel rate. The LCD Controller outputs one pixel per pixel clock cycle. Some LVDS transmitters accept a high speed, single pixel input and output to dual LVDS drivers, in which case external glue logic is unnecessary. For those LVDS transmitters that require the even and odd pixel to enter the LVDS transmitter at half the pixel clock rate, external logic is required.

## 13.4.3 System Interaction

### 13.4.3.1 DMA End of Frame Interrupts

The LCD module works with the DMA such that data is fetched from DDR and sent to a FIFO memory. The DMA module does this fetching independently of the logic on the output side of the FIFO.

For LIDD mode DMA, the module fetches frame buffer 0. When the last word of frame buffer 0 is stored in the FIFO memory, the Eof0 interrupt is triggered (if `cfg_eof_inten='1'`) and the DMA stops. The CPU has to set `cfg_lidd_dma_en='0'`, followed by a `cfg_lidd_dma_en='1'`, before the next burst from frame buffer 0 is read from DDR.

For Raster mode DMA, the module fetches frame buffer 0. When the last word of frame buffer 0 is stored in the FIFO memory, the Eof0 interrupt is triggered (if `cfg_eof_inten='1'`) but the DMA does not stop. The DMA module ping pongs immediately to frame buffer 1 if `cfg_frame_mode='1'`. Otherwise, the DMA fetches the frame buffer 0 address range from DDR. When the DMA module fetches frame buffer 1, and the last word of frame buffer 1 is stored in the FIFO memory, the Eof1 interrupt is triggered (if `cfg_eof_inten='1'`). This pattern would repeat.

## 13.4.4 Palette Lookup

For Active Matrix and Passive Matrix modes, the 12-bit Palette RAM Lookup can be used. For Active Matrix (`cfg_lcdtft = '1'`), palette lookup is enabled when `cfg_tft24 = '0'` and the `bpp` field in the Palette RAM is set to "000," "001," "010," or "011" (1, 2, 4, or 8 bpp). Palette lookup cannot be used when the `bpp` field is set to "100" (12/16 bpp).

For Passive Matrix (`cfg_lcdtft = '0'`), palette lookup is enabled when the `bpp` field in the Palette RAM is set to "000," "001," "010," or "011" (1, 2, 4, or 8 bpp). Palette lookup cannot be used when the `bpp` field is set to "100" (12/16 bpp).

Palette lookup scenarios are illustrated in [Figure 13-18](#).

When the `bpp` encoding is set to 1 bpp, each bit in a 16-bit frame buffer halfword is used to index the two bottom locations of the palette RAM. Suppose the frame buffer bit value is '0', this '0' indicates that the address 0 entry in the Palette RAM should be read. If the frame buffer bit value is '1,' the address 1 entry in the Palette RAM is used. The resulting 12-bit output from the Palette RAM is the quantized pixel value of a 4-bit per color component quantized pixel value.

When the `bpp` encoding is set to 2 bpp, every two bits in a 16 bit frame buffer halfword is used to index the bottom 4 locations of the palette RAM. Suppose the frame buffer bit value is "00." This "00" indicates that the address 0 entry in the Palette RAM should be read. If the frame buffer bit value is "01," the address 1 entry in the Palette RAM is used. When the frame buffer bit value is "10," the address 2 entry in the Palette RAM is read. Finally, if the frame buffer bit value is "11," the address 3 entry in the Palette RAM is read. The resulting 12 bit output from the Palette RAM is the quantized pixel value of the 4 bit per color component.

The 4 bpp encoding allows every four bits from a frame buffer halfword to address 16 entries in the Palette RAM.

The 8 bpp encoding enables every byte from a frame buffer halfword to address one of the 256 entries in the Palette RAM.

**Figure 13-18. Palette Lookup Examples**

A 16-bit halfword is read from the DDR frame buffer. This halfword can be byte lane and halfword swapped using the DMA configuration values `cfg_byte_swap` and `cfg_bigendian`. This section will deal with the frame buffer data as it is returned post swapped from the DMA module.

The DMA module actually outputs a 32-bit word. The Palette Lookup logic uses the lower halfword first, followed by the upper halfword. The `cfg_rddorder` and `cfg_nibmode` registers determine the raster read ordering of the frame buffer data to be sent to the palette lookup table.

There are precedence rules for the hardware as it parses each 16-bit word from the frame buffer.

1. If `cfg_rddorder = '0'`, the data halfword is parsed from the least significant bit to the most significant bit.
2. Else, if `cfg_nibmode = '1'`, the data halfword is parsed byte swapped with the scan order going from the most significant bit of each byte to the least significant bit of each byte.
3. Otherwise, the data halfword is parsed from the most significant bit to the least significant bit.

The bitwise scan order for each halfword fetched from the frame buffer is shown in the following lists. The bitfields returned are used to determine the addressing of the Palette RAM.

**Frame buffer halfword scan order for 1 bpp**

1. If `cfg_rdorder = 0`, scan order is [0] [1] [2] [3] [4] [5] [6] [7] [8] [9] [10] [11] [12] [13] [14] [15]
2. Else if `cfg_nibmode=1`, scan order is [7] [6] [5] [4] [3] [2] [1] [0] [15] [14] [13] [12] [11] [10] [9] [8]
3. Otherwise, scan order is [15] [14] [13] [12] [11] [10] [9] [8] [7] [6] [5] [4] [3] [2] [1] [0]

**Frame buffer halfword scan order for 2 bpp**

1. If `cfg_rdorder = 0`, scan order is [1:0] [3:2] [5:4] [7:6] [9:8] [11:10] [13:12] [15:14]
2. Else if `cfg_nibmode=1`, scan order is [7:6] [5:4] [3:2] [1:0] [15:14] [13:12] [11:10] [9:8]
3. Otherwise, scan order is [15:14] [13:12] [11:10] [9:8] [7:6] [5:4] [3:2] [1:0]

**Frame buffer halfword scan order for 4 bpp**

1. If `cfg_rdorder = 0`, scan order is [3:0] [7:4] [11:8] [15:12]
2. Else if `cfg_nibmode=1`, scan order is [7:4] [3:0] [15:12] [11:8]
3. Otherwise, scan order is [15:12] [11:8] [7:4] [3:0]

**Frame buffer halfword scan order for 8 bpp**

1. If `cfg_rdorder = 0`, scan order is [7:0] [15:8]
2. Else if `cfg_nibmode=1`, scan order is [7:0] [15:8]
3. Otherwise, scan order is [15:8] [7:0]

### 13.4.5 Test Logic

### 13.4.6 Disable and Software Reset Sequence

In Raster Modes, the module must be disabled before applying a software reset. When `cfg_lcden` is set to '0' to disable the module, the output continues to the end of the current frame.

The Done interrupt will trigger once the frame is complete. The software reset can then be applied to the module.

The software reset will clear all the frame information in the FIFO. Upon a restart, the L3 DMA will fetch from the `fb0_base` address.

To summarize:

- Set `cfg_lcden='0'`.
- Wait for the Done interrupt.
- Set the software reset bits high (`cfg_main_rst='1'` or [`cfg_dma_rst='1'` and `cfg_core_rst='1'`]) for several cycles.
- Set the resets back low.
- Set `cfg_lcden='1'`.

The disable and reset sequence must be done in this order to properly operate the LCD module and the EMIF.

### 13.4.7 Precedence Order for Determining Frame Buffer Type

The precedence order for determining frame buffer type is specified as follows:

```

If (cfg_lcdtft == 1) // active matrix
  If (cfg_tft24 == 1) // 24 bpp
    If (cfg_tft24_unpacked == 1)
      4 pixels in 4 words
    else
      4 pixels in 3 words
  else // 1/2/4/8/12/16 bpp
    if (bpp[2] == 1)
      12/16 bpp data
    else
      if (bpp == 0)
        1 bpp data
      else if (bpp == 1)
        2 bpp data
      else if (bpp == 2)
        4 bpp data
      else // if (bpp == 3)
        8 bpp data
  else // passive matrix
    if (bpp[2] == 1)
      12/16 bpp data
    else
      if (bpp == 0)
        1 bpp data
      else if (bpp == 1)
        2 bpp data
      else if (bpp == 2)
        4 bpp data
      else // if (bpp == 3)
        8 bpp data
  
```

## 13.5 LCD Registers

[Table 13-13](#) lists the memory-mapped registers for the LCD. All register offset addresses not listed in [Table 13-13](#) should be considered as reserved locations and the register contents should not be modified.

**Table 13-13. LCD REGISTERS**

Offset	Acronym	Register Name	Section
0h	PID		<a href="#">Section 13.5.1</a>

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 13-17. LIDD\_CS0\_CONF Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-27	w_su	R/W	0h	Write Strobe Set-Up cycles When performing a write access, this field defines the number of memclk cycles that Data Bus/Pad Output Enable, , the Direction bit, and Chip Select 0 have to be ready before the Write Strobe is asserted The minimum value is 0x0
26-21	w_strobe	R/W	0h	Write Strobe Duration cycles Field value defines the number of memclk cycles for which the Write Strobe is held active when performing a write access The minimum value is 0x1
20-17	w_hold	R/W	0h	Write Strobe Hold cycles Field value defines the number of memclk cycles for which Data Bus/Pas Output Enable, ALE, the Direction bit, and Chip Select 0 are held after the Write Strobe is de-asserted when performing write access The minimum value is 0x1
16-12	r_su	R/W	0h	Read Strobe Set-Up cycles When performing a read access, this field defines the number of memclk cycles that Data Bus/Pad Output Enable, , the Direction bit, and Chip Select 0 have to be ready before the Read Strobe is asserted
11-6	r_strobe	R/W	0h	Read Strobe Duration cycles Field value defines the number of memclk cycles for which the Read Strobe is held active when performing a read access The minimum value is 0x1
5-2	r_hold	R/W	0h	Read Strobe Hold cycles Field value defines the number of memclk cycles for which Data Bus/Pad Output Enable, , the Direction bit, and Chip Select 0 are held after the Read Strobe is deasserted when performing a read access The minimum value is 0x1
1-0	ta	R/W	0h	Field value defines the number of memclk (ta+1) cycles between the end of one CS0 device access and the start of another CS0 device access unless the two accesses are both Reads In this case, this delay is not incurred The minimum value is 0x0

### 13.5.5 LIDD\_CS0\_ADDR Register (offset = 14h) [reset = 0h]

LIDD\_CS0\_ADDR is shown in Figure 13-23 and described in Table 13-18.

**Figure 13-23. LIDD\_CS0\_ADDR Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 13-18. LIDD\_CS0\_ADDR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	Reserved	R	0h	
15-0	adr_indx	R/W	0h	The LCD Controller supports a shared Address/Data output bus A write to this register would initiate a bus write transaction A read from this register would initiate a bus read transaction CPU reads and writes to this register are not permitted if the LIDD module is in DMA mode (cfg_lidd_dma_en = 1) If the LIDD is being used as a generic bus interface, writing to this register can store adr_indx to an external transparent latch holding a 16-bit address If the LIDD is being used to interface with a character based LCD panel in configuration mode, reading and writing to this register can be used to access the command instruction area of the panel

### 13.5.6 LIDD\_CS0\_DATA Register (offset = 18h) [reset = 0h]

LIDD\_CS0\_DATA is shown in [Figure 13-24](#) and described in [Table 13-19](#).

**Figure 13-24. LIDD\_CS0\_DATA Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 13-23. RASTER\_CTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-27	Reserved	R/W	0h	
26	tft24unpacked	R/W	0h	24 bit Mode Packing Only used when <code>cfg_tft24=1</code> and <code>cfg_lcdtft=1</code> 0: 24-bit pixels are packed into 32 bit boundaries, which means 4 pixels are saved in every three words Word 0: <code>pix1[7:0]</code> , <code>pix0[23:0]</code> Word 1: <code>pix2[15:0]</code> , <code>pix1[23:8]</code> Word 2: <code>pix3[23:0]</code> , <code>pix2[23:16]</code> 1: 24-bit pixels are stored unpacked in with the uppermost byte unused Word 0: Unused[7:0], <code>pix0[23:0]</code> Word 1: Unused[7:0], <code>pix1[23:0]</code> Word 2: Unused[7:0], <code>pix2[23:0]</code> Word3: Unused[7:0], <code>pix3[23:0]</code>
25	tft24	R/W	0h	24 bit mode 0 = off 1 = on (24-bit data in active mode) The format of the framebuffer data depends on <code>cfg_tft24unpacked</code>
24	stn565	R/W	0h	Passive Matrix Mode only ( <code>cfg_lcdtft=0</code> ) and 16 bpp raw data framebuffers ( <code>bpp = ?00?</code> ) If the <code>bpp</code> field in the framebuffer palette header is <code>?00?</code> (12/16/24 bpp source), then the DDR contains raw data and the palette lookup is bypassed Only for this case, this bit selects whether the framebuffer format is 16 bpp 565 or 12 bpp The Grayscale can only take 12 bits per pixel The framebuffer data is 16 bits per pixel 565 when <code>stn565</code> is set to '1' and only the 4 most significant bits of each color component are sent to the Grayscale input 0: Framebuffer is 12 bpp packed in bits [11:0] 1: Framebuffer is 16 bpp 565
23	tftmap	R/W	0h	TFT Mode Alternate Signal Mapping for Palettized framebuffer Must be '0' for all 12/16/24 bpp raw data formats Can only be '1' for 1/2/4/8 bpp Palette Lookup data Valid only in Active Matrix mode when <code>cfg_lcdtft=1</code> 0 = 4 bits per component output data for 1, 2, 4, and 8 bpp modes will be right aligned on <code>lcd_pins (11:0)</code> 1 = 4 bits per component output data for 1, 2, 4, and 8 bpp will be converted to 5,6,5, format and use pins (15:0) R3 R2 R1 R0 R3 G3 G2 G1 G0 G3 G2 B3 B2 B1 B0 B3
22	nibmode	R/W	0h	Nibble Mode This bit is used to determine palette indexing and is used in conjunction with <code>cfg_rdorder</code> 0: Nibble mode is disabled 1: Nibble mode is enabled

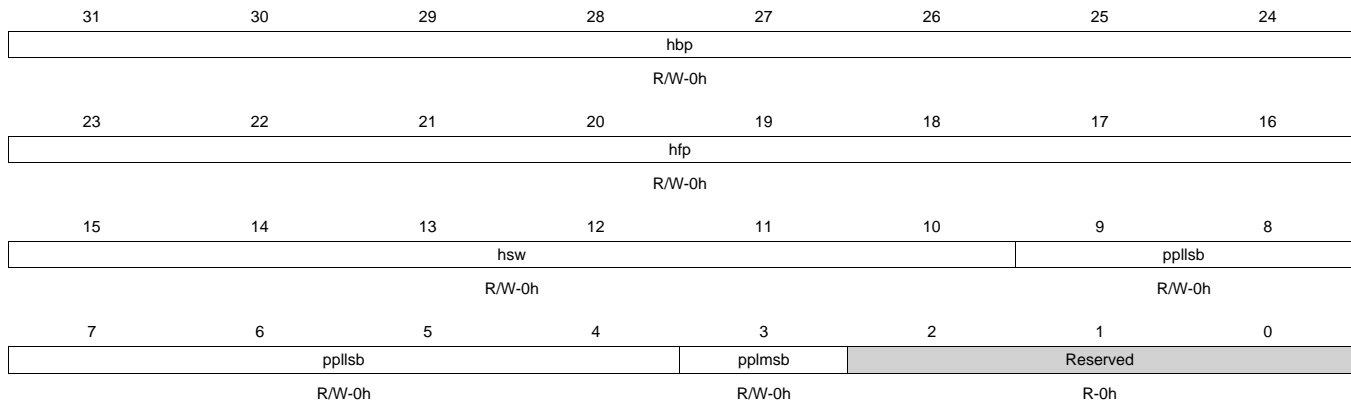

**Table 13-23. RASTER\_CTRL Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
21-20	palmode	R/W	0h	Palette Loading Mode 00: Palette and data loading, reset value 01: Palette loading only 10: Data loading only For Raw Data (12/16/24 bpp) framebuffer, no palette lookup is employed Thus, these framebuffers should use the data-only loading mode
19-12	reqdly	R/W	0h	Palette Loading Delay When loading the Palette from DDR, palette data is burst into the internal Palette SRAM from the Async FIFO 1-, 2-, and 4-bit per pixel framebuffer encodings use a fixed 16-word entry palette residing above the video data The 8 bit per pixel framebuffer encoding uses a 256-word entry palette residing above the video data Likewise, 12, 16, and 24 bit per pixel framebuffer encodings also define a 256-word entry palette even though these encodings will not do a full bit-depth palette lookup However, the 256-word palette entry must still be read from DDR as a framebuffer is fetched Bursting in 256 words in sequential lcd_clk cycles may cause the Async FIFO to underflow depending on the SOC DDR burst bandwidth This 8-bit reqdly parameter pauses reading of the Palette data from the Async FIFO between each burst of 16 words The delay is in terms of lcd_clk (system clock) cycles Value (0-255) used to specify the number of system clock cycles that should be paused between bursts of 16 word reads from the Async FIFO while loading the Palette SRAM Programming reqdly=00h disables this pause when loading the palette table
11-10	Reserved	R/W	0h	
9	nono8b	R/W	0h	Mono 8 bit 0: lcd_pixel_o[3:0] is used to output four pixel values to the panel each pixel clock transition 1: lcd_pixel_o[7:0] is used to output eight pixel values to the panel each pixel clock transition This bit is ignored in all other modes
8	rdorder	R/W	0h	Raster Data Order Select 0: The frame buffer parsing for Palette Data lookup is from Bit 0 to bit 31 of the input word from the DMA output 1: The fame buffer parsing for Palette Data lookup is from Bit 31 to Bit 0 of the input word from the DMA output This bit has no effect on raw data framebuffers (12/16/24 bpp) This bit is used to determine palette indexing and is used in conjunction with cfg_nibmode
7	lcdtft	R/W	0h	LCD 0: Passive or display operation enabled, dither logic is enabled 1: Active or display operation enabled, external palette and DAC required, dither logic bypassed, pin timing changes to support continuous pixel clock, output enable, vsync, and hsync
6-2	Reserved	R/W	0h	
1	lcdbw	R/W	0h	Only Applies for Passive Matrix Panels LCD Monochrome 0: Color operation enabled 1: Monochrome operation enabled
0	lccden	R/W	0h	LCD Controller Enable 0: LCD controller disabled 1: LCD controller enabled

### 13.5.11 RASTER\_TIMING\_0 Register (offset = 2Ch) [reset = 0h]

RASTER\_TIMING\_0 is shown in [Figure 13-29](#) and described in [Table 13-24](#).

**Figure 13-29. RASTER\_TIMING\_0 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 13-24. RASTER\_TIMING\_0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	hbp	R/W	0h	Horizontal Back Porch Lowbits Bits 7:0 of the horizontal back porch field Encoded value (from 1-1024) used to specify the number of pixel clock periods to add to the beginning of a line transmission before the first set of pixels is output to the display (programmed value plus 1) Note that pixel clock is held in its inactive state during the beginning of the line wait period in passive display mode, and is permitted to transition in active display mode
23-16	hfp	R/W	0h	Horizontal Front Porch Lowbits Encoded value (from 1-1024) used to specify the number of pixel clock periods to add to the end of a line transmission before line clock is asserted (programmed value plus 1) Note that pixel clock is held in its inactive state during the end of line wait period in passive display mode, and is permitted to transition in active display mode
15-10	hsw	R/W	0h	Horizontal Sync Pulse Width Lowbits Bits 5:0 of the horizontal sync pulse width field Encoded value (from 1-1024) used to specify the number of pixel clock periods to pulse the line clock at the end of each line (programmed value plus 1) Note that pixel clock is held in its inactive state during the generation of line clock in passive display mode, and is permitted to transition in active display mode
9-4	pplsb	R/W	0h	Pixels-per-line LSB[9:4] Encoded LSB value (from 1-1024) used to specify the number of pixels contained within each line on the LCD display (programmed to value minus one) $PPL = 11'b\{pplmsb, pplsb, 4'b1111\} + 1$ ex: $pplmsb=1'b1, pplsb=6'0001000$ $PPL = 11'b\{1, 000100, 1111\} + 1 = 1104d$ (decimal) pixels per line In other words, $PPL = 16 * (\{pplmsb, pplsb\} + 1)$
3	pplmsb	R/W	0h	Pixels-per-line MSB[10] Needed in order to support up to 2048 ppl
2-0	Reserved	R	0h	

### 13.5.12 RASTER\_TIMING\_1 Register (offset = 30h) [reset = 0h]

RASTER\_TIMING\_1 is shown in [Figure 13-30](#) and described in [Table 13-25](#).

**Figure 13-30. RASTER\_TIMING\_1 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 13-25. RASTER\_TIMING\_1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	vbp	R/W	0h	Vertical Back Porch Value (from 0-255) use to specify the number of line clock periods to add to the beginning of a frame before the first set of pixels is output to the display Note that line clock transitions during the insertion of the extra line clock periods
23-16	vfp	R/W	0h	Vertical Front Porch Value (from 0-255) used to specify the number of line clock periods to add to the end of each frame Note that the line clock transitions during the insertion of the extra line clock periods
15-10	vsw	R/W	0h	Vertical Sync Width Pulse In active mode (lcdtft=1), encoded value (from 1-64) used to specify the number of line clock periods to set the lcd_fp pin active at the end of each frame after the (vfp) period elapses The number of clock cycles is programmed value plus one The frame clock is used as the VSYNC signal in active mode In passive mode (lcdtft=0), encoded value (from 1-64) used to specify the number of extra line clock periods to insert after the vertical front porch (vfp) period has elapsed Note that the width of lcd_fp is not affected by vsw in passive mode and line clock transitions during the insertion of the extra line clock periods (programmed value plus one)
9-0	lpp	R/W	0h	Lines Per Panel Encoded value (programmed value range of {0:2047} represents an actual range of {1:2048}) used to specify the number of lines per panel It represents the total number of lines on the LCD (programmed value plus one) Bit 10 of this field is in RASTER_TIMING_2

### 13.5.13 RASTER\_TIMING\_2 Register (offset = 34h) [reset = 0h]

RASTER\_TIMING\_2 is shown in [Figure 13-31](#) and described in [Table 13-26](#).

**Figure 13-31. RASTER\_TIMING\_2 Register**
